INITIAL ISSUE DATE
MARCH 1/86

REVISED JANUARY 1/08

FAA APPROVED/ACCEPTED

The Federal Aviation Administration (FAA) has reviewed the Instructions for Continued Airworthiness (ICA) submitted pursuant to FAA Part 33 for the engine models listed. The ICA were found to be acceptable and the Airworthiness Limitations Section contained therein is hereby approved.

JAN 1/08

Subject: PW4000 Engine Manual, Part Number 50A443, Revision Number 85, dated January 1, 2008

Please put these revision pages in the manual and remove the superseded pages as shown in the applicable List of Effective Pages.

Make a record on the Record of Revisions Sheet that this revision was put in the manual.

A document evaluation form is included with this revision to assist us in improving the quality of our technical manuals. Please distribute this form to the end-user of this document for completion.

Each revision to this manual will include a "PW4000 Supplemental Consumable Materials Index". The supplemental index provides information concerning materials which have just been added to this manual. These new materials will be included in the next revision to the master index.

If there is a question on manual content, send it to Thomas M. Mann, Supervisor, Technical Writing, Maintenance Data Engineering. The telephone number is (860) 565-2994 and the fax number is (860) 565-4503.

To be sure that revision service is continuous, please send any change in address or revision requirements to me.

Sincerely,

Joan C. Olson
Supervisor, Distribution
Maintenance Data Engineering

INTRODUCTION

INTRODUCTION

1. General

   A. This supplemental index lists the consumable materials which have been added to this manual since the last revision of the Master Consumable Materials Index PN 50A542.

   B. This supplement should be used with the Master Consumable Materials Index until the next revision to that document. The next revision to the Master Consumable Materials Index will incorporate the information contained in this supplement.

   C. Refer to the PW4000/PW6000 Series Master Consumable Materials Index PN 50A542 for more information.

2. Supplier Code Address List

   A. The addresses of the material manufacturers which are not included in the current published revision of the PW4000/PW6000 Series Master Consumable Materials Index PN 50A542 are listed in the following table.

Supplier Code	Name/Address

No supplemental information is required for this revision. Refer to the Master Consumable Materials Index, Part Number 50A542.

SUPPLEMENTAL CONSUMABLE MATERIALS LIST

SUPPLEMENTAL CONSUMABLE MATERIALS LIST

ITEM NO.	AIRLINE STOCK NO.	MATERIAL DESIGNATION	SPECIFICATION NUMBER	MATERIAL MANUFACTURERS REFERENCE AND/OR SPECIFICATION	SUPPLIER CODE

No supplemental information is required for this revision. Refer to the Master Consumable Materials Index, Part Number 50A542.

SERVICE BULLETIN LIST--NACELLE

NACELLE

Service Bulletins listed are those applicable to engine models covered in this manual. For those bulletins listed as incorporated, the manual provides information on engine parts or configurations for both before and after bulletin compliance.

"RETROFIT": Intent of the Service Bulletin has been incorporated in the manual and that, because the configuration prior to the Service Bulletin does not exist in service, the prior configuration is not covered in the manual.

"NO EFFECT": No change to the manual was necessary as a result of the Service Bulletin issue. (If no separate entry appears for the CIR MANUAL PN 51A357, the term "NO EFFECT" means that no change was necessary to either the Engine Manual or the CIR Manual.)

"CANCELED": Service Bulletin has been canceled. Parts or configurations introduced by the bulletin are not covered in the manual.

"CIR": New part numbers introduced by the Service Bulletin have been incorporated into the CIR MANUAL - PN 51A357.

LIST OF EFFECTIVE SECTIONS

The current date levels of Lists of Effective Pages in this manual are specified in this List of Effective Sections. Revised or added sections for this revision are indicated by an "R" mark.

This List of Effective Sections records not only the dates of sections revised or added in this revision, but also the dates of all other List of Effective Pages remaining in the manual that are not revised or added. If there is a question about the correct date level of a section in this manual, it is recommended that all Lists of Effective Pages be examined to see if they have the correct dates as specified below.

This list is revised with each revision of the manual.

R		Introduction	JAN 1/08
		How To Use	JUN 15/03
		Time Limits	DEC 15/06
	71-00-00 POWER PLANT GENERAL	Power Plant General	DEC 15/97
	71-00-00 FAULT ISOLATION	Power Plant General - Fault Isolation	SEP 15/97
	71-00-00 STORAGE TRANSPORT	Power Plant General - Storage/Transport	DEC 15/06
R	71-00-00 TESTING	Power Plant General - Testing	JAN 1/08
	71-00-33	Power Plant General - Fan Case	DEC 15/06
	71-00-34	Power Plant General - Intermediate Case	MAR 15/94
	71-00-35	Power Plant General - High Pressure Compressor (HPC)	MAR 15/06
	71-00-41	Power Plant General - Diffuser And Combustor	MAR 15/06
	71-00-52	Power Plant General - High Pressure Turbine (HPT)	JUN 15/93
	71-00-53	Power Plant General - Low Pressure Turbine (LPT)	JUN 15/93

	71−00−54	Power Plant General − Turbine Exhaust Case	DEC 15/03
	71−00−61	Power Plant General − Main Gearbox	DEC 15/06
R	72−00−00	Engine General	JAN 1/08
	72−00−00	Storage/Transport	DEC 15/06
	72−00−31	Engine General − Low Pressure Compressor (LPC)	MAY 1/07
	72−00−32	Engine General − LPC/LPT Coupling	MAY 1/07
	72−00−33	Engine General − Fan Case	DEC 15/06
	72−00−34	Engine General − Intermediate Case	DEC 15/06
	72−00−35	Engine General − High Pressure Compressor (HPC)	SEP 1/07
R	72−00−41	Engine General − Diffuser And Combustor	JAN 1/08
	72−00−51	Engine General − Turbine Nozzle	MAY 1/07
R	72−00−52	Engine General − High Pressure Turbine (HPT)	JAN 1/08
	72−00−53	Engine General − Low Pressure Turbine (LPT)	MAY 1/07
	72−00−54	Engine General − Turbine Exhaust Case	DEC 15/06
	72−00−61	Engine General − Main Gearbox	DEC 15/06
	72−00−62	Engine General − Angle Gearbox	MAR 15/06
	72−09−00	Engine General − Common Parts	DEC 15/01
R	72−31	Low Pressure Compressor (LPC)	JAN 1/08
	72−32	LPC/LPT Coupling	MAR 15/05
	72−33	Fan Case	MAY 1/07
	72−34	Intermediate Case	DEC 15/06
R	72−35	High Pressure Compressor (HPC)	JAN 1/08
	72−41	Diffuser And Combustor	MAY 1/07
	72−51	Turbine Nozzle	DEC 15/05

	72−52	High Pressure Turbine (HPT)	SEP 1/07
R	72−53	Low Pressure Turbine (LPT)	JAN 1/08
	72−54	Turbine Exhaust Case	MAR 15/06
R	72−61	Main Gearbox	JAN 1/08
	72−62	Angle Gearbox	MAY 1/07

1. Engine Model Application

A. This document is the property of United Technologies Corporation (UTC). UTC produces this document for the purpose of supporting engine certification requirements and, of providing information related to the proper use, maintenance, inspection, repair, servicing, and parts application of Pratt & Whitney engine products and services. By accepting this document the recipient agrees to limit copying the document, or any information in it, solely for distribution within the recipient's company or to a third party to carry out UTC's stated purpose for the document and any information in it. You cannot possess, use, copy, or disclose this document or any information in it for any purpose other than that stated above, without UTC's express written permission. Violation of these restrictions may result in criminal and/or civil liability.

B. This manual contains procedures which are applicable to these engine models and models with configuration identifiers:

PW4152, PW4152 (-1C/-1E), PW4152 (-3A), PW4152 (-3),
PW4156A, PW4156A (-1C/-1E), PW4156A (-3A), PW4156A (-3),
PW4158, PW4158 (-1C/-1E), PW4158 (-3A), PW4158 (-3)

C. The material that follows is applicable to engine models with configuration identifiers for engines that were obtained by conversion after original manufacture.

(1) These engine configurations (intermix engines), come from service bulletins. They are identified by a configuration identifier such as (-1C) and (-3E) after the basic engine model on the engine data plate.

(2) Only the basic engine models in the list that follows are shown for the page effectivity in this manual. These engine configurations use all data that is applicable to the basic engine model unless specified in other instructions.

(3) The list that follows specifies the correct basic model to use for each of the above engine configurations (intermix engines).

PW4152 (−1C/−1E) ... Refer to Basic Model PW4152
PW4152 (−3A) ... Refer to Basic Model PW4152 (−3)
PW4156A (−1C/−1E) ... Refer to Basic Model PW4156A
PW4156A (−3A) ... Refer to Basic Model PW4156A (−3)
PW4158 (−1C/−1E) ... Refer to Basic Model PW4158
PW4158 (−3A) ... Refer to Basic Model PW4158 (−3)

2. General

A. This publication is compiled and issued by the Product Support Department of Pratt & Whitney, Commercial Products Division, East Hartford, Connecticut 06108−0969 U.S.A. It includes approved and recommended procedures required for uninstalled maintenance of PW4000 Series engines.

B. Phase III engines are identified by a space (−3) following the applicable model. An example is PW4152 (−3). These engines are correctly shown on the Title Page of this manual. However, the List of Effective Pages and page Effectivity, in this manual, will have this engine listed as PW4152−3, without the space and the ( ). This is done because of computer space limits.

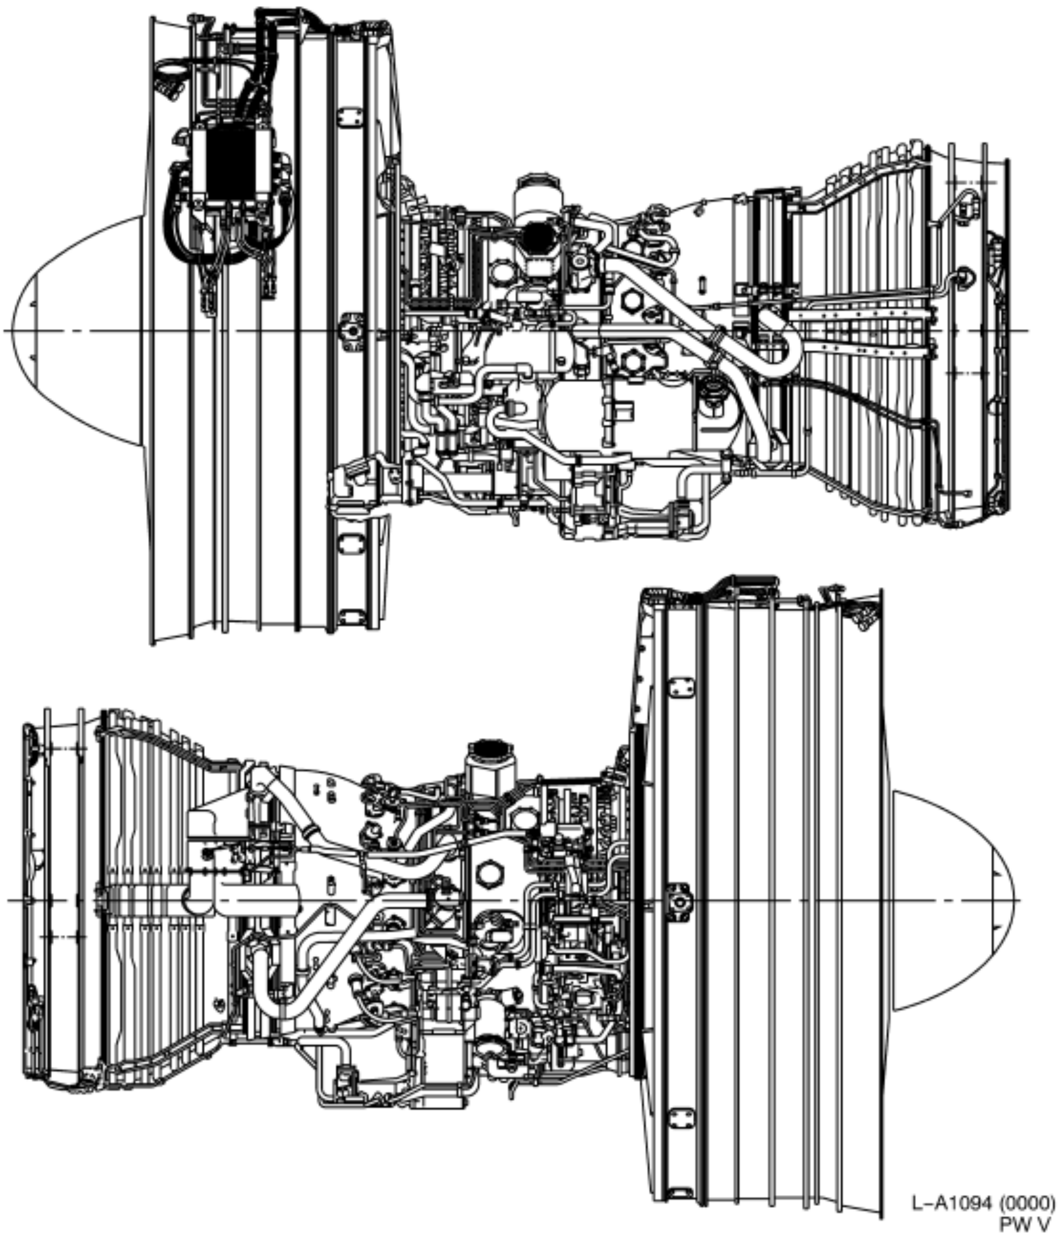
C. The information and instructions contained herein are based upon actual experience acquired under varied and exacting conditions. The utmost in dependable engine performance will be gained by conforming to these instructions. General reference left and right side views of the engine are shown in Figure 1.

D. Unusual problems concerning engine maintenance should be presented to the Product Support Department either through its field representatives or by direct contact. All possible assistance will be provided toward the solution of these problems.

E. Requests for pertinent information not covered by this publication, and suggestions for modification or amplification of these instructions so as to increase their usefulness, will be welcomed by the Pratt & Whitney Product Support Department.

F. This publication will be revised as necessary to incorporate the latest approved data.

INTRODUCTION



L-A1094 (0000)

Engine Side Views
Figure 1

3. Supplementary Publications

A. It is recommended that personnel concerned with engine maintenance also familiarize themselves with the following publications:

B. Engine Cleaning Inspection And Repair PW4000 Series CIR, PN 51A357 − This manual gives the recommended cleaning, inspection and repair procedures for individual parts that have been disassembled and removed from the engine. It will also have a small number of disassembly, assembly and test procedures that are necessary to support the cleaning, inspection and repair of the removed parts.

C. Illustrated Parts Catalog PW4152 Series IPC, PN 50A445 − This catalog lists and illustrates all salable parts of the engine covered in this manual.

The Illustrated Parts Catalog has been sectionalized and tab divided to be compatible with the Chapter/Section divisions of the Engine Manual. The illustrated Parts Catalog may, at the users discretion, be maintained in the same binders with the Engine Manual. The tab divided sections of the Illustrated Parts Catalog may be located in the Engine Manual binders following the corresponding Chapter/Section of the Engine Manual.

D. Engine Component Maintenance Manuals (P&W) − These manuals provide maintenance instructions for the component, as well as inspection limits, repairs, diagnostic tests and disassembly/assembly instructions. See the "Index of P&W Commercial Jet Engine Manuals And Parts Catalogs" for listing of P&W engine component maintenance manuals.

E. Engine Component Maintenance Manuals (Vendor) − These manuals provide maintenance instructions for the component, as well as inspection limits, repairs, diagnostic test and disassembly/assembly instructions.

Subsequent to initial distribution to airline operators, component maintenance manuals and illustrated parts catalogs covering vendor engine accessories listed in the "Index Of P&W Commercial Jet Engine Manuals And Parts Catalogs" should be ordered directly from the vendor. When ordering publications from the vendors listed, please indicate the part number of the component for which publications is required.

F. Nacelle Component Maintenance Manuals − These manuals provide maintenance instructions for the component, as well as inspection limits, repairs, diagnostic tests and disassembly/assembly instructions. See the "Index Of P&W Commercial Jet Engine Manuals And Parts Catalogs" for listing of these manuals. These documents may be ordered directly from Pratt & Whitney.

G. Illustrated Tool And Equipment Manual (PN 51A009) − This manual (ITEM) includes illustrations and corresponding data for all Pratt & Whitney special support tools and equipment required to Assemble/Disassemble, Maintain, Inspect, Repair, and Test the parts and assemblies of the PW4000 Series Engine.

H. Support Equipment Numerical Index (PN 50A557) − This document is used in conjunction with the engine manual and support equipment design and master sheet aperture cards. This document numerically lists, by maintenance level, all Pratt & Whitney special support equipment required to disassemble, assemble, inspect, repair, troubleshoot and test the power plant.

I. Service Bulletins − Service Bulletins will be issued as required to provide information or instructions for modifying earlier production engines or parts to the latest configuration.

Service Bulletins applicable to the engine models covered by this manual are reflected in the List of Service Bulletins.

J. Maintenance Advisory Notices (MAN's) − These documents are issued as required to provide help in on−wing or off−wing maintenance of the engine. It is not the intention of the MAN's to replace the engine manual, service bulletins or other maintenance documents approved by the regulatory authorities. The MAN's, along with the engine and nacelle service bulletin management documents, are designed to help the airlines and overhaul shops make an overall maintenance plan for PW4000 Series Engines.

Maintenance Advisory Notices applicable to engine models covered in this manual are shown in the List of Maintenance Advisory Notices.

INTRODUCTION

K. Standard Practices Manual, PN 585005 - This manual contains approved and recommended standard practices information, instructions, and procedures used repeatedly on various engines manufactured by Pratt & Whitney.

NOTE: If thread lubricant and torque values are not specified when required, refer to Standard Practices Manual, PN 585005, Assembly-01 (Task 70-52-00-400-101).

L. Power Plant Illustrated Parts Catalog - This catalog includes part information pertaining to line replaceable units and maintenance spares for the propulsion system.

M. Power Plant Buildup Manual - This manual provides Quick Engine Change (QEC) component buildup instructions for a basic testable engine to configure it to a fully positionalized power plant ready for installation on the aircraft.

N. Structural Repair Manual - This manual provides instructions and data relative to repair of the nacelle primary and secondary structure.

O. Thrust Reverser Manual - This manual provides all necessary data for maintenance of the Thrust Reverser in the shop. It includes instructions for disassembly, assembly, cleaning, inspection and repair.

P. Inlet Cowl Manual - This manual provides maintenance instructions for the inlet cowl including service limits, repairs and disassembly/assembly instructions.

Q. Fan Cowl Doors (L.H. and R.H.) - These manuals provide maintenance instructions including disassembly, assembly, cleaning, inspection and repair of the fan cowl doors.

R. Engine Mounts (Forward And Aft) - These manuals provide maintenance instructions including disassembly, assembly, cleaning, inspection and repair of the engine mounts.

S. Exhaust Nozzle And Plug - These manuals provide maintenance instructions including disassembly, assembly, cleaning, inspection and repair of the nozzle and plug.

WARNING: BEFORE YOU USE ANY OF THE MATERIALS SHOWN IN THE CONSUMABLE MATERIALS INDEX. YOU MUST KNOW ALL OF THE PRECAUTIONS RECOMMENDED BY THE MANUFACTURER OF THE SUPPLIER.

THESE PRECAUTIONS TELL YOU HOW TO:

- USE THE MATERIAL SAFELY
- KEEP THE MATERIAL SAFELY
- DISCARD THE MATERIAL SAFELY

YOU MUST READ THE MATERIAL SAFETY DATA SHEETS (OSHA FORM 20 OR EQUIVALENT) TO LEARN THE RECOMMENDED PRECAUTIONS, THE SAFETY/DATA SHEETS ARE SUPPLIED BY THE MANUFACTURER OR THE SUPPLIER OF THE MATERIAL.

T. Consumable Material Index - This document contains information concerning consumable materials which are specified in the Engine Manual and in engine accessory Component Maintenance Manuals.

U. A section has been added to the Pratt & Whitney Standard Practices Manual, PN 585005 (Section 70-00-00, General-02) that contains a listing of previously approved technical data that has been superseded by Pratt & Whitney with current technical data or is technical data that Pratt & Whitney will no longer support for the maintenance of Pratt & Whitney products. Before the use of this technical data, you must make sure that the document number is not contained within the subject listing.

4. Inspection Requirements For Engines Not Inducted Into An Engine Repair Facility

A. Maintenance Review Board Repair (MRB) tasks, Airworthiness Directives (AD Notes), Aircraft Maintenance Manuals and other FAA accepted documents, for example Certification Maintenance Requirements (CMR) satisfy the inspection requirements for continued airworthiness for engines not inducted into an engine repair facility.

5. Minimum Inspection Requirements For Engines Inducted Into An Engine Repair Facility

A. General

(1) The Information that follows is being provided to clarify Engine Manual requirements for continued airworthiness for owners and operators without an approved maintenance/reliability program.

(2) Engine Repair Facility definition: An engine repair facility is a FAA approved Engine Repair Station (or equivalent) that is capable of compliance with the minimum inspection requirements defined by this section. The engine is considered induced into the repair facility when the engine is accepted by the repair facility for any type of work regardless of whether the work is performed on a charge or no charge basis.

(3) At one time, some engine parts contained asbestos fibers and it is possible that some of these parts continue in service. Refer to the commercial engine service bulletins for a listing of parts that once contained asbestos. In some parts, the material that contains asbestos may be within an adhesive. It is important to use correct precautions during work with these parts. Operators must obey all local regulations and employer work policies when parts that contain asbestos are handled or discarded. The asbestos used in Pratt & Whitney engine parts was usually encapsulated and will not release dust unless the parts are ground, sanded, drilled, scraped, cut, or broken. While it is our experience that these operations do not usually generate asbestos at levels in excess of permissible exposure limits, operators must use all applicable precautions when handling such parts.

B. Requirements

(1) The following items define the minimum requirements that Pratt and Whitney series engines must comply with following induction into an engine repair facility to ensure the continued airworthiness of the engine. It is recognized that individual owner/operators or repair agencies may desire to go beyond these requirements to perform inspections, repairs, modifications,

and/or conversions to address the economics of engine operation and maintenance.

NOTE: All performed cleaning, disassembly, assembly, inspections, repairs, modifications, tests, storage, preservation and other tasks must adhere to the requirements defined in the Engine Manual (EM) and the Cleaning Inspection And Repair Manual (CIR) and in supporting FAA accepted documents such as the Illustrated Parts Catalog, Standard Practices Manual and Service Bulletins.

(a) Engine Testing, which is defined by the EM based on the extent of disassembly, must be performed per the testing shown in Chapter/Section 71−00−00 Testing−00.

(b) All applicable requirements of Airworthiness Directives (AD Notes) must be complied with. See Chapter/Section 05−10−00 for all necessary Airworthiness Directives (AD Notes) issued by the United States FAA and other regulatory agencies against the models of P&W engines covered by the EM and CIR.

(c) All parts installed on the engine must be in compliance with the specific engine model build list and manufactured in accordance with Original Engine Manufacturer (OEM) and/or FAA requirements/approved data.

(d) Regardless of the extent of disassembly, no parts which exceed their life limits as defined in Chapter/Section 05−10−00 Instructions for Continued Airworthiness may be present in the engine following repair.

(e) Regardless of the extend of disassembly, all applicable Maintenance Review Board Report (MRB) tasks must be complied with.

NOTE: The Maintenance Review Board Report tasks are summarized in PW4000 Maintenance Advisory Notice Number MAN−PW4000−1−93.

(f) All gaspath sections of the engine which are not disassembled for visual or more detailed inspections must receive a complete borescope inspection and must be repaired as necessary as defined in the EM and CIR.

(g) For engines inducted into an engine repair facility, the reason for the induction must be corrected.

(h) Parts/components/modules accessed during the engine repair or configuration (engine repair not associated with an operational discrepancy) require visual inspection to the appropriate part/component/module limits per the EM and CIR and Item (f) above.

(i) Parts/components/modules with unacceptable conditions must be repaired or replaced. All replacement parts/components/modules must meet the fits/clearances requirements directly affected by that part/component/module.

(j) All life limited parts that are removed from the engine and disassembled to the individual part level for overhaul must be non destructive inspected (NDI) per the EM and CIR. Specific NDI procedures called out by AD Notes and Service Bulletins must also be complied with.

(k) Approval of a part for continued service is not permitted until all necessary inspections specified in section 05−10−00 are done.

(l) For engines with Electronic Engine Control (EEC), all "Fault Level A" messages reported by the EEC during engine testing must be addressed.

6. Parts And Service

A. Service

(1) Pratt & Whitney maintains a Product Support Department to assist its customers in the operation, maintenance and overhaul of Pratt & Whitney engines. Product Support Department representatives maintain contact with operators and engine service activities and are available for the investigation of any specific difficulty or problem. Any request for assistance should be addressed directly to the Product Support Department, Pratt & Whitney, Commercial Products Division, East Hartford, Connecticut 06108−0969, U.S.A.

B. Ordering Parts

(1) Whenever possible, refer to the appropriate Illustrated Parts Catalog, when ordering parts. In case a parts list is not available, give engine model, manufacturer's engine serial number, and a full description of the part and where it is used. All spare parts orders should be addressed directly to the Commercial Parts Support Department, Pratt & Whitney, Commercial Products Division, East Hartford, Connecticut 06108−0969 U.S.A.

(2) Because some parts require special or expensive equipment for assembling and cannot be fabricated except in a specially equipped shop, they are not furnished individually and must be purchased as assemblies. If an order is received for a unit of an assembly coming under this classification, the complete assembly will be shipped.

C. Returning Parts

(1) Material for investigation:

(a) All material sent back to Pratt & Whitney for investigation goes to one of these addresses.

(b) All material sent back to Pratt & Whitney for investigation must have a number five (5) copy of a Request for Support Allowance (RSA) with it.

NOTE: The Request for Material Return (RMR) number must be referenced on the Request for Support Allowance (RSA).

(3) Individual parts returned for Service Policy Benefits:

(a) Refer to the Repair Vendors List that is in the Introduction Section of Engine Cleaning Inspection Repair Manual (PN 51A357).

1 Refer to Pratt & Whitney Eagle Services (Source Code 8N802) on the Vendor Repair List.

2 Individual parts, sent back for Service Policy Benefits, are sent to the Pratt & Whitney Eagle Services (Source Code 8N802), specified, or other vendors as specified in that source code.

NOTE: Choose the address and vendor by the product line they service. Refer all questions to the Eagle Services, East Hartford, at the number or address given in the Repair Vendors List.

(b) All individual parts sent back must have a number five (5) copy of a Request for Support Allowance (RSA) with it.

(c) Individual parts sent back with this procedure must have the operator's charge purchase order to get the correct billing.

(4) Use sufficient protection on parts to prevent damage while they are shipped.

(5) Put individual part tags on parts which are removed from more than one engine or which have different part times, and prepare individual RSA'S for these parts.

D. Vendor Services

(1) The names of any companies provided in this publication as a possible source for required services or supplies are furnished for information purposes only. Except for the work or supplies to be performed or furnished by Pratt & Whitney, it is understood that Pratt & Whitney does not endorse the work performed by the company or companies names herein or any other company and does not accept responsibility to any degree for the selection of such company or companies for the performance of any work or procurement of supplies. Pratt & Whitney does not endorse the work performed or supplies procured from these companies. Further, Pratt & Whitney does not accept responsibility, to any degree, for the selection of such companies for such work performed nor supplies procured.

7. Parts Cleaning/Inspection/Repair Sequence

A. It is possible that repair procedures will have a "Prerequisite" section with these or similar statements:

(1) Refer to Repair−00 for part numbers to which this repair is applicable.

NOTE: The purpose of this prerequisite is to make sure that a repair is applicable to a part number before that repair is started.

(2) Make sure (verify) that all cleaning and inspection procedures are done before this repair.

(a) For parts that will get inspections in accordance with all applicable Engine Manual or Cleaning, Inspection and Repair (CIR) Manual inspections (parts which will get overhaul):

1 Before a repair or multiple repairs are started, be sure that all applicable cleaning, coating removals, and inspections are done in the order that follows:

a Clean. (Refer to the applicable CIR Manual or Engine Manual ATA Chapter.)

b Remove coating as needed. (Refer to the Standard Practices Manual 70−32−00 and 70−33−00 for coating removal requirements.)

c Do all applicable inspections. (Refer to the applicable CIR Manual or Engine Manual ATA Chapter.)

d Repair. (Refer to the applicable CIR Manual or Engine Manual ATA Chapter.)

(b) For parts that will get inspections in accordance with an approved owner's / operator's maintenance plan in which full compliance with all Engine Manual or Cleaning, Inspection and Repair (CIR) Manual inspections are not necessary (limited workscopes): inspection requirements of the approved owner's / operator's maintenance plan are applicable.

NOTE: Repeated or cumulative applications of limited workscopes are not intended to be, nor are they acceptable as a substitute for the overhaul of a part or component.

1 When a repair is applicable in local areas, clean the local repair area(s) of the part by the Engine Manual or Cleaning, Inspection and Repair (CIR) Manual requirements.

NOTE: Typical examples of local repairs are blend, weld, detail replacement, cold work, touch−up (and there can be more). Tank stripping, plating, and plasma coating, for example, do not have the definition of local repairs. If there are questions about whether a local repair is applicable, send questions to the Customer Technical Service Department either through its field representatives or by direct contact.

NOTE: When SPOP 203 or SPOP 18 and SPOP 209 are specified (see SPM 70−20−00; Selection of Cleaning Procedures), a local application of SPOP 209 or SPOP 208 only is sufficient before the initial FPI or FMPI.

2 Visually examine and do non−destructive inspections (if applicable to the part) by the Overhaul Manual, Engine Manual or Cleaning, Inspection and Repair (CIR) Manual requirements on the area for which the repair is necessary. Other cleaning and/or dimensional inspection of the repair area(s) can be necessary as the result of the visual inspection or processing requirements. Local cleaning and inspection must be as specified in the Standard Practices Manual and Engine Manual or Cleaning, Inspection and Repair (CIR) Manual.

NOTE: SPOP 70 is permitted for local repairs. The local fluorescent penetrant sensitivity level must agree with the sensitivity level of the fluorescent penetrant inspection requirements (SPOP 62, SPOP 82, or SPOP 84) specified in the Fluorescent Penetrant Inspection parts list of detail parts in the Overhaul Manual, Engine Manual or Cleaning, Inspection and Repair (CIR) Manual for the part to get repaired.

3 If in addition to 4.A. (2), there are other prerequisites to a repair (detail removal, coating removal, etc.), it will be necessary to do these operations.

4 Repair the part by the procedure steps in the applicable Overhaul Manual, Engine Manual or Cleaning, Inspection, and Repair (CIR) Manual repair.

B. At one time, some engine parts contained asbestos fibers and it is possible that some of these parts continue in service. Refer to the commercial engine service bulletins for a listing of parts that once contained asbestos. In some parts, the material that contains asbestos may be within an adhesive. It is important to use correct precautions during work with these parts. Operators must obey all local regulations and employer work policies when parts that contain asbestos are handled or discarded. The asbestos used in Pratt & Whitney engine parts was usually encapsulated and will not release dust unless the parts are ground, sanded, drilled, scraped, cut or broken. While it is our experience that these operations do not usually generate asbestos at levels in excess of permissible exposure limits, operators must use all applicable precautions when handling such parts.

8. Parts And Processes Certified By Pratt & Whitney

A. Federal Aviation Regulations require that each type certificate holder provide "Instructions For Continued Airworthiness". The information contained in this manual is a part of the data provided by Pratt & Whitney to meet this requirement. The information contained in this manual applies only to parts and processes certified by Pratt & Whitney. The information contained in this manual does not apply to parts and processes not certified by Pratt & Whitney. An example of a part/process not certified by Pratt & Whitney would include parts manufactured under a parts manufacturer approval (PMA) even though the use of such parts may be authorized by the Federal Aviation

Administration. Accordingly owners, operators, and repairers (overhaulers) of Pratt & Whitney products should obtain the required instructions for continued airworthiness for parts and processes not certified by Pratt & Whitney from the manufacturer or holder of the authority for the use of such parts and processes.

9. Repair Vendors

A. Master Repair Vendors List

(1) For the master list of repair vendors, refer to Section 70-40-00, General-01 (Task 70-40-00-990-001) in the Standard Practices Manual, PN 585005.

NOTE: Except for work or supplies to be performed or furnished by Pratt & Whitney, Pratt & Whitney does not endorse the work performed by the company or companies identified herein or any other company and does not accept responsibility to any degree for the selection of such company or companies for the performance of any work or procurement of supplies.

B. Supplemental Repair Vendors List

(1) This supplemental list contains repair source code information that is new or revised since the last issued revision of the Standard Practices Manual, PN 585005. See Table 1.

(2) This supplemental list must be used with the Standard Practices Manual, PN 585005 until the next revision to that document. The next revision to the Standard Practices Manual will incorporate the information contained in this supplemental list.

(3) Due to the critical nature of a source demonstration repair, repair sources must demonstrate to Pratt & Whitney their capability to perform the repair and be licensed by Pratt & Whitney. If you are interested in being considered by Pratt & Whitney for a license to perform a source demonstration repair, contact the address given in Figure 2.

R (4) Repair sources must be licensed by Pratt & Whitney to
R perform a proprietary repair. If you are interested in
R being considered by Pratt & Whitney for a license to
R perform a proprietary repair, contact the address given
R in Figure 2.

R NOTE: Contact information for source demonstration
R or proprietary repairs provided in Figure 2
R supersedes different addresses previously
R published in source demonstration or proprietary
R repairs.

R Source Code Vendor Name/Address

R No new source code information has been added
R since the last revision of the Standard Practices
R Manual, PN 585005.

R Supplemental Source Code And Vendor Name/Address
R Table 1

10. Explanation Of Manual Format

A. Specification

(1) This manual has been prepared per ATA Specification No. 100 as established by the Air Transport Association of America.

(2) The element numbering system employed in this manual corresponds with that employed in the Illustrated Parts Catalog. Details on how elements have been assigned are given in the How To Use Section of this manual.

11. Equivalent Tools, Fixtures, Test Equipment

A. In accordance with federal regulations (14CFR43.13), anyone performing work on an engine covered by this manual under the jurisdiction and authority of the Federal Aviation Administration (FAA) must use tools, equipment, and test apparatus which will assure that such work will be completed in accordance with industry standards. If Pratt & Whitney recommends special equipment or test apparatus, each person performing the work must use that equipment or apparatus or its equivalent that is acceptable to the Administrator of the FAA. Special provisions of the FAA regulations regarding tools, equipment, and test apparatus apply to holders of certain air carriers' operating certificates and

certificates issued under certain specified parts of those regulations.

B. The expendable parts necessary to accomplish a task are listed at the beginning of each task in the Expendable Parts List. The IPC locations (Chapter−Section−Figure−Item Number) are given to locate the parts in the IPC. You must determine the applicable Item Number Alpha variant and the correct part number based on the effectivity and model codes in the IPC. The IPC and applicable SBs provide part number effectivity and usage.

12. Corporate Trademarks

A. The following words, acronyms, or designs are trademarks of
R United Technologies Corporation. See Figure 3.

B. The following words or acronyms are other trademarks: TURBOFIX

13. Weights And Measures

A. Weights and measures are provided for both U.S. customary and SI − metric measurement systems. The SI − metric measurement value will appear in parenthesis immediately following the U.S. customary system equivalent. SI − metric equivalents for equal U.S. customary system values may differ slightly, depending on application as well as procedures utilized in the automated conversion program.

14. Directional References

A. Directional references such as right and left, clockwise and counterclockwise, upper and lower are applicable to the engine as seen from the rear with the engine in the horizontal position and with the accessory (gearbox) section at the bottom of the engine (unless otherwise stated).

15. Abbreviations

A. The use of abbreviations has been avoided as much as possible. In some instances however, such consideration as space limitations, common usage, etc., have made the use of abbreviations preferable to the use of the applicable longer
R terms. Abbreviations used are defined in Table 2 and Table
R 3.

16. Tube Function Numbers

A. Tube function numbers are added to the tube nomenclatures and figures in the various sectionalization chapters. The tube function numbers help positively identify tubes with common nomenclatures, help cross reference between the Engine Manual and Illustration Parts Catalog, and help to identify the tube function. These numbers do not change with part progression as the tube part numbers do. The tube function numbers also relate to the tables, schematics, and installation locations that are provided in Chapter/Section
R 72-09-71. See Table 4.

Tube Function Numbers	
A	Air System
(AA##)	Air Actuation System
(AC##)	Air Cooling System
(AP##)	Air Pressurizing System
(AS##)	Air Sense System
C	Hydraulic Control System
(CP##)	Hydraulic Control Pressure System
(CR##)	Hydraulic Control Return System
F	Fuel System

R Tube Function Numbers
R Table 4

Tube Function Numbers	
(FM##)	Fuel Main Supply System
(FS##)	Fuel Supply to Injector System
L	Lubrication System
(LB##)	Lubrication Breather System
(LD##)	Lubrication Drain System
(LP##)	Lubrication Pressure System
(LR##)	Lubrication Return Scavenge System
(LS##)	Lubrication IDG System

NOTE: See 72−09−71, Description And Operation for related information and schematics for the different systems.

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

HOW TO USE MANUAL

1. HOW TO USE THIS MANUAL

This section describes the PW4000 Series Engine Manual organization. In addition, certain guidelines are provided to assist data location.

This publication provides specific information concerning the engine and the demountable (Quick Engine Change - QEC) power plant. The demountable power plant is defined as the engine including the nacelle parts which are engine mounted and are removed from the aircraft as a unit.

Procedures contained in this manual assume the power plant includes (but is not limited to) the following major parts and systems:

Engine
Inlet Cowl
Exhaust Nozzle
Exhaust Plug
Engine Mounted Pneumatic Supply System
Engine Driven Accessories
Accessory Drain System
Engine Mounted Fire And Overheat Detectors

2. ORGANIZATION OF DATA

The manual is organized into three (3) major chapters; Chapter 05 Time Limits, Chapter 71 Power Plant, and Chapter 72 Engine. See Manual Numbering, System for an explanation of the Chapter/Section/Subject numbering system is used in this manual.

3. TIME LIMITS - CHAPTER 05

Chapter 05 provides the service life limits for specific engine parts.

4. POWER PLANT - CHAPTER 71

Chapter 71 provides the procedures for the demountable power plant which are required to support shop maintenance of the power plant.

HOW TO USE MANUAL

71−00−00 Four (4) tab separated sections contain data which is applicable to the entire power plant. Information provided in this section includes (but is not limited to) the following:

Procedures for removal of various power plant components.

Fault isolation procedures.

Procedures for transporting the engine by truck, to prepare the power plant for split−shipment, and to assemble a replacement power plant.

NOTE: Procedures for engine preservation and depreservation are covered in 72−00−00, Storage/Transporation.

Testing Procedures.

71−00−XX Twelve (12) tab separated sections contain data which is applicable to specific sections of the complete power plant. These sections provide the following:

Procedures required to gain access for separation of engine sections from the power plant.

EXAMPLE: Nacelle parts removal/disconnect procedures required to gain access for removal of the turbine exhaust case section of the engine are located in 71−00−54, Removal−01. This manual section is referenced as a prerequisite procedure in 72−00−54, Removal−01 for removal of the turbine exhaust case section from the power plant.

Procedures required to gain access to specific sections of the engine after removal from the power plant.

EXAMPLE: Nacelle parts removal procedure required prior to the disassembly of the turbine exhaust case section of the engine is located in 71−00−54, Disassembly−01. This manual section is referenced as a prerequisite procedure in 72−54−00, Disassembly−01 for

(CONTINUED)

disassembly of the turbine exhaust case.

Procedures required to replace individual nacelle components on a complete power plant. These procedures are located in the appropriate 71−00−XX manual section.

EXAMPLE: The procedure for removal of the inlet cowl is located in manual section 71−00−33, Removal−02.

These procedures may be used to support specific nacelle parts replacement. They may also be referenced as prerequisite or postrequisite procedures for other shop maintenance requirements in the manual.

5. ENGINE − CHAPTER 72

Chapter 72 provides the procedures for the shop maintenance of the engine. Data in this chapter is divided into tab separated sections for specified areas of the engine.

72−00−00 This tab separated section contains data which is applicable to the entire engine. Information provided in this section includes (but is not limited to) the following:

- Borescope inspection of the engine gaspath.
- Servicing of the engine oil system.
- Preservation/depreservation of the engine.
- Special trunnioning procedures.
- Rigging of engine systems.

72−00−XX Twelve (12) tab separated sections contain data which is applicable to specified sections of the complete engine. Information provided in these sections includes (but is not limited to) the following:

Procedures to remove and install the engine section.

Procedures to remove and install individual external

(CONTINUED)

	engine parts/components from an assembled engine. Fits and clearances concerning external parts/ components and internal interface parts between engine sections.
72–09	This tab separated section contains data which is applicable to common parts or to parts not assigned to other engine sections. Information provided in this section includes (but is not limited to) the following: Reference tables for the tube function number to nomenclature relationship, installation location, and actual location on the engine.
72–XX	Twelve (12) tab separated sections contain data which is applicable to specific engine sections after separation from the rest of the engine. Inforamtion provided in these sections includes the following: Procedures to disassemble the engine section. Fits and clearances for the parts of the engine section. Procedures and limits for inspection of the engine section. Procedures for assembly of the engine section.

6. ENGINE SECTION IDENTIFICATION

Figure 1 identifies the engine sections by nomenclature and by Chapter/Section number.

7. TAB SEPARATED SECTIONS OF THE ENGINE MANUAL

The following is a list of tab separator titles used in this manual. Specific sections within the power plant (71–00–XX) portion of the manual will not contain procedural information. These tab separators are provided for continuity with the engine sections only.

8. MANUAL NUMBERING SYSTEM

A three element Chapter/Section/Subject number has been assigned to each power plant and engine section and to each significant part within the engine. This identifying number appears at the lower right−hand corner of each page adjacent to the page number. These numbers are assigned in accordance with the Air Transport Association (ATA) Specification 100.

The first element of the number identifies the Chapter. This manual contains data applicable to Chapters 05, 71 and 72.

The second element identifies the engine section of the Chapter. Chapter 72 sections are assigned as follows:

72−09	Common Parts
72−31 through 72−35	Compressor
72−41	Diffuser and Combustor
72−51 through 72−54	Turbine
72−61 and 72−62	Gearbox

In the Power Plant General Chapter 71−00 and Engine General Chapter 72−00, the engine section identifiers are used in the third element. These numbers identify data which concerns a specific engine section when that section is still on the complete power plant or engine.

EXAMPLE:

71−00−34

72−00−34

34 Section Identifier − Intermediate Case

72−34−00

See Tab Separated Sections list for specific identification of engine sections.

In Chapter 72 the third element is applied to identify significant parts or units of the specific engine section. See Figure 2.

EXAMPLE

72−31−04

72	Chapter Identifier − Engine
3	Section Identifier − Compressor
1	Subsection Identifier − Low Pressure Compressor (LPC)
04	Subject (Significant Part Or Unit) − Stage 2 LPC Blade

See Chapter/Section/Subject Numbering Outline for specific identification of sections and engine parts or units.

9. PAGE FOOTING

Each manual page contains a unique page footing identifier. See Figure 3.

The right−hand page footing contains the Chapter/Section/Subject number, function title, page block number, and page revision date. Configuration designation is located under the function title when applicable.

The left−hand page footing contains the Engine Model Effectivity statement and the configuration descriptive statement when applicable. These elements of the page footing are defined elsewhere in this manual section.

10. ENGINE MODEL EFFECTIVITY

The engine model effectivity for this manual is established by the models listed on the Title Page.

Manual sections applicable to all of the models listed on the Title Page have an effectivity statement in the page footing that reads:

EFF: ALL

Manual sections applicable to a specific engine model are identified with an effectivity statement in the page footing similar to the following example:

EFF: PW4056

11. FUNCTION TITLES AND PAGE BLOCK NUMBERS

The separation of data in this manual is identified by a function title and a page block number. These identifiers are located at the lower right−hand portion of each page. See the Page Footing paragraph of this section for function and page block examples. Function titles are also printed in the heading on each page. Most function sections are further divided (Inspection/Check−00, Inspection/Check−01, etc.) to allow for specific tasks within a page block.

Function titles and the corresponding page block numbers are organized as follows:

DESCRIPTION AND OPERATION	Page 1 − 99

This functional title is used to provide general background information on location, basic design characteristics and function of the engine section being addressed. The information is intended to be basic and uncomplicated. In The Engine General section, Description and Operation for the entire engine is outlined, with brief descriptions of each major engine section. In the individual engine sections, description and operation for that area is provided in more detail.

FAULT ISOLATION	Page 101 − 199

This section of the manual provides procedures for guiding the user from identification of an engine problem, through possible causes, to isolation of the problem and corrective actions to be taken.

HOW TO USE MANUAL

SPECIAL PROCEDURES Page 201 − 299

This section includes procedures that are normally required as a result of other maintenance actions and do not directly apply to other functional page blocks. This category may include alternate trunnioning procedures and systems rigging procedures. Procedures located in this function are referenced from other functional sections.

REMOVAL Page 301 − 399

This function provides the procedures for removal of a QEC part (from the assembled power plant), an engine section (from the assembled engine), or a part/component (from an assembled engine section).

INSTALLATION Page 401 − 499

This function provides the procedures for installation of a QEC part (to the assembled power plant), an engine section (to the assembled engine), or a part/component (to an assembled engine section).

DISASSEMBLY Page 501 − 599

This function provides the procedures for disassembly of an engine or power plant section into its detail parts. The procedures may be applied for either partial or complete disassembly of an engine section. Disassembly does not include separation of riveted or similarly retained subassemblies.

CLEANING Page 601 − 699

This function provides procedures for engine gaspath cleaning.

INSPECTION/CHECK Page 801 − 899

This function provides the detailed inspection and check procedures which are used to determine the serviceability of a part or unit. The information in this function includes, fits and clearances, borescope inspection, airflow checks, oil flow checks, leak checks, dimensional inspection, visual inspection, and non−destructive inspection (fluorescent penetrant, magnetic particle, X−ray, eddy current, ultrasonic, etc.).

HOW TO USE MANUAL

REPAIR	Page 901 − 999

This function provides the detailed repair procedures authorized for part or unit refurbishment. Each repair procedure is identified to specific part numbers.

ASSEMBLY	Page 1001 − 1099

This function provides the procedures for assembly of the detail parts into an engine section or subsection (subassembly).

SERVICING	Page 1101 − 1199

This function provides the procedures for routine servicing of engine systems. Included in this function is draining and filling of the engine oil system.

STORAGE	Page 1201 − 1299

This function provides the procedures for preservation of the engine during storage and procedures for depreservation after storage. Procedures for packing and unpacking the engine and engine sections are also included in this function.

STORAGE/TRANSPORT	Page 1201 − 1299

This function provides the procedures for preparation before and after split shipment of the power plant or of the engine.

TESTING	Page 1301 − 1399

This function provides the procedures and parameters to ensure the operational integrity of the engine following other maintenance functions.

12. DATA LOCATING GUIDELINES

Specific data concerning an engine part may be located in the manual by the following steps.

- If the part nomenclature and/or general engine location is known, determine the Chapter/Section/Subject number assigned to the part. This may be accomplished by referring to the Chapter/Section/Subject Numbering Outline and the related illustrations.
- If the part nomenclature is uncertain but the part number is known, determine the correct nomenclature by the use of the appropriate Illustrated Parts Catalog (IPC). The IPC may also provide the corresponding Chapter/Section designation.

Using this part nomenclature and Chapter/Section information determine the complete Chapter/Section/Subject number as per step above.

- Locate the tab separator which corresponds to the Chapter/Section portion of the number determined in step above.
- Locate the part in the Table Of Contents for that manual section. The Table Of Contents is arranged in numerical order by Chapter/Section/Subject number.
- Functional requirements for the subject part are listed in the Table Of Contents and are arranged in numerical order by page block numbers and function numbers. See the list of function titles and page block numbers in the section.
- Specific data concerning the subject part is located in the same order as shown in the Table Of Contents.
- If inspection information is required for the part, refer to the part number index in the Inspection/Check−00 for that Chapter/Section/Subject. The index identifies all inspection procedures that are applicable for the specific part number.
- If repair information is required for the part, refer to the part number index in the Repair−00 for that Chapter/Section/Subject. The index identifies all repair procedures that are applicable for the specific part number.

Specific data concerning the complete power plant or engine may be located in the manual by the following steps.

- Determine the functional category for the data.

EXAMPLE

Type Of Data	Functional Category
Borescope Inspection	− Inspection/Check
Rigging	− Special Procedures
Oil Tank Filling	− Servicing

- Locate the functional page block for the data in the Table Of Contents of the appropriate manual section.
- The specific data will be found in the manual in the same order as shown in the Table Of Contents.

13. TASK NUMBERING SYSTEM

See Figure 4 and Table 1.

This manual utilizes a structure which is based on the Air Transport Association (ATA) Specification No. 100, Jet Engine Maintenance Task Oriented Support System (JEMTOSS). The structure which incorporates discrete task and subtask numbers for text, illustrations, and tables allows for adaptation of this manual to an individual user's specific manual or electronic system.

The task numbering system allows for data selection or cross−reference by unique task or subtask numbers. The task numbers provide a precise, unchanging point of reference which is not affected by revisions to page or paragraph numbers.

The functional arrangement of data and the ATA Specification 100 numbering system form the basis for the assignment of maintenance task numbers to each operation described in the manual. The task number contains five (or six) elements. The first three of these elements are the ATA number and reflect the Chapter/Section/Subject number in the conventional manner. The fourth element identifies the function (inspection, repair, test, etc.). See Table 1 for specific fourth element function identification. The fifth element provides a unique identification for each task/subtask within the function. A sixth element may be assigned when necessary to identify configurational differences, or method variations from a basic task.

In addition to basic task numbers, subtask numbers have been assigned to steps within the task. This allows identification of changes in maintenance functions within a task. For example, a repair may require premachining, plating, finish machining and heat treat; subtask numbers would be assigned as necessary to each text unit to show function change.

Each SPOP (Service Process Operation Procedure) has been assigned a Standard Practices Subtask number. The first three elements are the ATA number (expanded to six digits) of the page block in the Standard Practices Manual where the SPOP is located. The fourth and fifth elements have been assigned as explained above. These subtask numbers appear either in tabular format or in procedural text, each time a SPOP is referenced in this manual.

The task numbers are included in the manual to assist the operator in the management of technical data if the system is utilized; however the manual may be used in a conventional manner, since the arrangement of technical data is unaffected.

14. MAINTENANCE RESOURCES

Equipment and materials informational paragraphs are located at the beginning of each task. They contain any Standard Tools, Special Tools, Consumable Material, Expendable Parts, Repair Details, and/or Packaging Equipment required to accomplish the task. Tools already in place such as build stands and fixtures are not included. Consumable materials are identified by a general nomenclature and a unique code number. The procurement information for each coded consumable material is contained in the PW4000 Consumable Materials Index.

Task Number Function Code Definitions
Table 1 (Continued)

15. CHAPTER/SECTION/SUBJECT NUMBERING OUTLINE

The following is a complete listing of the individual Chapter/Section/Section/Subject numbers and specific nomenclatures which have been assigned to the significant engine sections and parts.

Numbers which are not assigned are indicated in the list by one of the following terms:

UNASSIGNED − This designation is for numbers intentially omitted and reserved for possible future use.

NOT USED − This designation is for numbers used for other related engine models which are not, at this time, applicable to the engine models covered by this manual.

TIME LIMITS	05−10−00
POWER PLANT GENERAL	71−00−00
POWER PLANT GENERAL − FAULT ISOLATION	71−00−00
POWER PLANT GENERAL − STORAGE/TRANSPORT	71−00−00
POWER PLANT GENERAL − TESTING	71−00−00
POWER PLANT GENERAL − LOW PRESSURE COMPRESSOR (LPC)	71−00−31
POWER PLANT GENERAL − LPC/LPT COUPLING	71−00−32
POWER PLANT GENERAL − FAN CASE	71−00−33

HOW TO USE MANUAL

POWER PLANT GENERAL − INTERMEDIATE CASE	71−00−34
POWER PLANT GENERAL − HIGH PRESSURE COMPRESSOR (HPC)	71−00−35
POWER PLANT GENERAL − DIFFUSER AND COMBUSTOR	71−00−41
POWER PLANT GENERAL − TURBINE NOZZLE	71−00−51
POWER PLANT GENERAL − HIGH PRESSURE TURBINE (HPT)	71−00−52
POWER PLANT GENERAL − LOW PRESSURE TURBINE (LPT)	71−00−53
POWER PLANT GENERAL − TURBINE EXHAUST CASE	71−00−54
POWER PLANT GENERAL − MAIN GEARBOX	71−00−61
POWER PLANT GENERAL − ANGLE GEARBOX	71−00−62
POWER PLANT ENGINE MOUNTS	71−20−00
NOT USED	71−21−01 through 71−22−99
ENGINE GENERAL	72−00−00
ENGINE GENERAL − LOW PRESSURE COMPRESSOR (LPC)	72−00−31
ENGINE GENERAL − LPC/LPT COUPLING	72−00−32
ENGINE GENERAL − FAN CASE	72−00−33
ENGINE GENERAL − INTERMEDIATE CASE	72−00−34
ENGINE GENERAL − HIGH PRESSURE COMPRESSOR (HPC)	72−00−35
ENGINE GENERAL − DIFFUSER AND COMBUSTOR	72−00−41
ENGINE GENERAL − TURBINE NOZZLE	72−00−51
ENGINE GENERAL − HIGH PRESSURE TURBINE (HPT)	72−00−52
ENGINE GENERAL − LOW PRESSURE TURBINE (LPT)	72−00−53
ENGINE GENERAL − TURBINE EXHAUST CASE	72−00−54
ENGINE GENERAL − MAIN GEARBOX	72−00−61
ENGINE GENERAL − ANGLE GEARBOX	72−00−62

ENGINE GENERAL − COMMON PARTS	72−09−00
ENGINE BEARINGS	72−09−50
BALANCE (TOOL) BEARINGS	72−09−51
ENGINE EXTERNAL TUBES	72−09−71
NOT USED	72−09−72
ENGINE BRACKETS	72−09−73
ENGINE COMPONENT HEATSHIELDS	72−09−74
TURBINE CASE COOLING MANIFOLD (HPT)	72−09−75
TURBINE CASE COOLING MANIFOLD ASSEMBLY (LPT)	72−09−76
TURBINE CASE COOLING DUCT ASSEMBLY	72−09−77
LOW PRESSURE COMPRESSOR (LPC) See Figure 5	72−31−00
AXIAL COMPRESSOR ROTOR ASSEMBLY	72−31−01
NOT USED	72−31−02
STAGE 1.6 LPC BLADE	72−31−03
STAGE 2 LPC BLADE	72−31−04
STAGE 3 LPC BLADE	72−31−05
STAGE 4 LPC BLADE	72−31−06
FRONT COMPRESSOR HUB ASSEMBLY	72−31−07
DRUM ROTOR DISK ASSEMBLY	72−31−08
LPC STAGE 1 COMPRESSOR STATOR ASSEMBLY	72−31−09
LPC (STAGE 1.6, 2, AND 3) COMPRESSOR STATOR ASSEMBLY	72−31−10
LPC STAGE 4 DUCT	72−31−11
LPC (DRUM TO HUB) TIEROD	72−31−12
LPC TIEROD NUT	72−31−13

HOW TO USE MANUAL

NO. 1 BALL BEARING	72-31-14
NO. 1 BEARING (INNER RACE) RETAINING NUT	72-31-15
NO. 1 BEARING SEAL SEAT	72-31-16
NO. 1 BEARING (CARBON) SEAL ASSEMBLY	72-31-17
NO. 1 BEARING FACE SEAL ASSEMBLY	72-31-18
NOT USED	72-31-19 through 72-31-27
NO. 1 BEARING SEAL SUPPORT ASSEMBLY	72-31-28
NOT USED	72-31-29 through 72-31-34
UNASSIGNED	72-31-35 through 72-31-79
COMPRESSOR INLET CONE FRONT SEGMENT	72-31-80
COMPRESSOR INLET CONE (REAR) SEGMENT ASSEMBLY	72-31-81
STAGE 1 LPC BLADE ASSEMBLY	72-31-82
COMPRESSOR BLADE (STAGE 1) LOCK ASSEMBLY	72-31-83
FAN EXIT FAIRING	72-31-84
NOT USED	72-31-85 through 72-31-87
UNASSIGNED	72-31-88 through 72-31-99
LPC/LPT COUPLING See Figure 6	72-32-00
TURBINE SHAFT COUPLING ASSEMBLY	72-32-01
NO. 1.5 ROLLER BEARING	72-32-02

NO. 1.5 BEARING SEAL SEAT	72-32-03
NO. 1.5 BEARING (INNER RACE) RETAINING NUT	72-32-04
UNASSIGNED	72-32-05 through 72-32-79
TURBINE SHAFT (COUPLING RETAINING) NUT	72-32-80
TURBINE SHAFT PLUG	72-32-81
UNASSIGNED	72-32-82 and 72-32-83
TURBINE SHAFT NUT	72-32-84
UNASSIGNED	72-32-85 through 72-32-99
FAN CASE See Figure 7	72-33-00
FAN CASE ASSEMBLY	72-33-01
FAN EXIT CASE AND VANE ASSEMBLY	72-33-02
FAN EXIT (OUTER) CASE	72-33-03
FAN EXIT INNER CASE ASSEMBLY	72-33-04
FAN EXIT BASE AND VANE ASSEMBLY	72-33-05
NOT USED	72-33-06 through 72-33-08
BLEED VALVE ASSEMBLY	72-33-09
ROD END CLEVIS (BLEED VALVE ACTUATOR)	72-33-10
SHOULDER BOLT (BLEED VALVE ACTUATOR CLEVIS)	72-33-11
BLEED VALVE CONNECTING LINK	72-33-12
BLEED VALVE LINKAGE BELL CRANK ASSEMBLY	72-33-13

HOW TO USE MANUAL

BLEED VALVE CAM FOLLOWER	72-33-14
SLEEVE SPACER (CAM FOLLOWER)	72-33-15
BLEED VALVE CAM FOLLOWER DAMPER ASSEMBLY	72-33-16
FAN EXIT (INNER AND OUTER) VANE SPACER	72-33-17
FAN EXIT LINER SEGMENT ASSEMBLY	72-33-18
BLEED VALVE DUCT SCREEN	72-33-19
BELL CRANK BRACKET ASSEMBLY	72-33-20
NOT USED	72-33-21
GROOVED HEADED PIN	72-33-22
SELF RETAINING PIN	72-33-23
UNASSIGNED	72-33-24 through 72-33-76
NOT USED	72-33-77 through 72-33-79
FAN EXIT (INNER) LINER SEGMENT ASSEMBLIES	72-33-80
FAN EXIT (FRONT) LINER SEGMENT ASSEMBLY	72-33-81
FAN EXIT INNER (BIFURCATION) FAIRING ASSEMBLY	72-33-82
FAN EXIT OUTER (BIFURCATION) FAIRING ASSEMBLY	72-33-83
NO. 3 BEARING AIR COOLER ASSEMBLY	72-33-84
NOT USED	72-33-85 through 72-33-92
UNASSIGNED	72-33-93 through 72-33-99

HOW TO USE MANUAL

INTERMEDIATE CASE See Figure 8	72-34-00
COMPRESSOR INTERMEDIATE CASE ASSEMBLY	72-34-01
FAN EXIT CASE FLANGE ASSEMBLY	72-34-02
NOT USED	72-34-03
NO. 2 BEARING AND SEAL ASSEMBLY	72-34-04
NO. 2 BEARING (CARBON) SEAL ASSEMBLY	72-34-05
NO. 2 BEARING SUPPORT ASSEMBLY	72-34-06
NO. 2 BEARING REAR FACE ASSEMBLY	72-34-07
SHOULDER STUD (NO. 2 BEARING DAMPER)	72-34-08
NO. 2 BEARING HOUSING ASSEMBLY	72-34-09
NO. 2 BEARING HOUSING SEAL RING	72-34-10
NO. 2 BEARING (OUTER RACE) RETAINING NUT	72-34-11
GEARBOX DRIVE BEVEL GEAR	72-34-12
SPACER RING	72-34-13
NO. 2 BALL BEARING	72-34-14
NO. 2 BEARING REAR SEAL SEAT	72-34-15
FIFTH STAGE HPC SHROUD RETAINING RING	72-34-16
UNASSIGNED	72-34-17 through 72-34-19
NO. 1.5 BEARING SUPPORT ASSEMBLY	72-34-20
GEARBOX DRIVE BEVEL GEARSHAFT	72-34-21
GEARSHAFT ROLLER BEARING	72-34-22
GEARSHAFT BALL BEARING	72-34-23
GEARBOX DRIVESHAFT COUPLING	72-34-24

MAIN BEARING (OIL) PRESSURE TUBE ASSEMBLY	72−34−25
NO. 2 BEARING (OIL) PRESSURE TUBE	72−34−26
NO. 1.5 AND 2 BEARING TUBE CONNECTOR ASSEMBLY	72−34−27
MAIN BEARING TUBE CONNECTOR ASSEMBLY	72−34−28
NO. 1.5 BEARING (OIL) NOZZLE ASSEMBLY	72−34−29
NO. 2 BEARING (OIL) NOZZLE ASSEMBLY	72−34−30
GEARBOX DRIVE (OIL) PRESSURE TUBE ASSEMBLY	72−34−31
GEARBOX DRIVE (OIL) NOZZLE ASSEMBLY	72−34−32
UNASSIGNED	72−34−33 and 72−34−34
NO. 1.5 AND 2 BEARING (CARBON) SEAL ASSEMBLY	72−34−35
NO. 1.5 AND 2 BEARING SEAL SUPPORT ASSEMBLY	72−34−36
FRONT NO. 2 BEARING FACE SEAL ASSEMBLY	72−34−37
NO. 1.5 BEARING FACE SEAL ASSEMBLY	72−34−38
UNASSIGNED	72−34−39 through 72−34−41
MAIN BEARING (OUTER) SCAVENGE TUBE ASSEMBLY	72−34−42
MAIN BEARING (INNER) SCAVENGE TUBE ASSEMBLY	72−34−43
UNASSIGNED	72−34−44 through 72−34−49
FOURTH STAGE COMPRESSOR STATOR ASSEMBLY	72−34−50
UNASSIGNED	72−34−51
ANGLE GEARBOX (SUPPORT) BRACKET ASSEMBLY	72−34−52
GEARBOX DRIVESHAFT ASSEMBLY	72−34−53

HOW TO USE MANUAL

NOT USED	72-34-54 through 72-34-66
UNASSIGNED	72-34-67 through 72-34-78
NOT USED	72-34-79
NO. 1 BEARING (OIL) PRESSURE MANIFOLD	72-34-80
NO. 1 BEARING REAR SUPPORT ASSEMBLY	72-34-81
NO. 1 BEARING FRONT SUPPORT	72-34-82
UNASSIGNED	72-34-83
NOT USED	72-34-84 through 72-34-94
UNASSIGNED	72-34-95 through 72-34-98
INTERMEDIATE CASE MISCELLANEOUS PARTS	72-34-99
HIGH PRESSURE COMPRESSOR (HPC) See Figure 9	72-35-00
AXIAL COMPRESSOR ROTOR ASSEMBLY	72-35-01
VARIABLE STATOR VANE AND HPC FRONT CASE ASSEMBLY	72-35-02
HPC STATOR VANE ACTUATOR AND LEVER ASSEMBLY	72-35-03
STAGES 5 THROUGH 15 HPC OUTER AIR SEAL SET	72-35-04
HPC FRONT HUB	72-35-05
STAGE 5 HPC DISK	72-35-06
HPC DRUM ROTOR (FRONT) DISK ASSEMBLY	72-35-07
HPC DRUM ROTOR (REAR) DISK ASSEMBLY	72-35-08
SHAFT, HPC DRIVE, TURBINE	72-35-09

HPC DRUM ROTOR (REAR) DISK ASSEMBLY	72−35−10
STAGE 5 HPC BLADE	72−35−11
STAGE 6 HPC BLADE	72−35−12
STAGE 7 HPC BLADE	72−35−13
STAGE 8 HPC BLADE	72−35−14
STAGE 9 HPC BLADE	72−35−15
STAGE 10 HPC BLADE	72−35−16
STAGE 11 HPC BLADE	72−35−17
STAGE 12 HPC BLADE	72−35−18
STAGE 13 HPC BLADE	72−35−19
STAGE 14 HPC BLADE	72−35−20
STAGE 15 HPC BLADE	72−35−21
HPC BLADE SEALS	72−35−22
HPC BLADE OUTER AIR SEALS (8−15 STAGES)	72−35−23
STAGE 8 COMPRESSOR STATOR SEGMENT	72−35−24
STAGE 9 COMPRESSOR STATOR SEGMENT	72−35−25
STAGE 10 COMPRESSOR STATOR SEGMENT	72−35−26
STAGE 11 COMPRESSOR STATOR SEGMENT	72−35−27
STAGE 12 COMPRESSOR STATOR SEGMENT	72−35−28
STAGE 13 COMPRESSOR STATOR SEGMENT	72−35−29
STAGE 14 COMPRESSOR STATOR SEGMENT	72−35−30
HPC INLET AIRSEAL	72−35−31
(HPC) DIFFUSER AIRSEAL	72−35−32
DIFFUSER AIRSEAL DAMPER	72−35−33
COMPRESSOR TIERODS	72−35−34

COMPRESSOR TIEROD NUTS	72−35−35
NO. 3 BEARING (INNER REAR HUB) HEAT SHIELD	72−35−36
STAGE 5 HPC DISK AND BLADES ASSEMBLY	72−35−37
DRUM ROTOR AND BLADES (FRONT) ASSEMBLY	72−35−38
DRUM ROTOR AND BLADES (REAR) ASSEMBLY	72−35−39
HPC FRONT CASE/OUTER AIRSEAL SET	72−35−40
HPC INLET SHROUD SEGMENT ASSEMBLY	72−35−41
STAGE 5 HPC SHROUD SEGMENT ASSEMBLY	72−35−42
STAGE 6 HPC SHROUD SEGMENT ASSEMBLY	72−35−43
STAGE 7 HPC SHROUD SEGMENT ASSEMBLY	72−35−44
VANE INNER TRUNNION SLEEVE BEARING AND KEY	72−35−45
VANE OUTER TRUNNION THRUST WASHER	72−35−46
HPC INLET VANE	72−35−47
STAGE 5 HPC VANE	72−35−48
STAGE 6 HPC VANE	72−35−49
STAGE 7 HPC VANE	72−35−50
HPC INLET SYNCHRONIZING RING ASSEMBLIES	72−35−51
STAGE 5 HPC SYNCHRONIZING RING ASSEMBLIES	72−35−52
STAGE 6 HPC SYNCHRONIZING RING ASSEMBLIES	72−35−53
STAGE 7 HPC SYNCHRONIZING RING ASSEMBLIES	72−35−54
HPC SYNCHRONIZING RING CLEVIS ASSEMBLIES	72−35−55
HPC SYNCHRONIZING RING PLATES	72−35−56
NOT USED	72−35−57
HPC SHROUD SEGMENT ASSEMBLY	72−35−58
STAGE 8 COMPRESSOR STATOR SET	72−35−59

STAGE 9 AND 10 COMPRESSOR STATOR SET	72−35−60
STAGE 11 AND 12 COMPRESSOR STATOR SET	72−35−61
STAGE 13 AND 14 COMPRESSOR STATOR SET	72−35−62
HPC STAGE 5 SHROUD SET	72−35−63
HPC STAGE 6 AND 7 OUTER SHROUD ASSEMBLY	72−35−64
HPC SHROUD SETS (STAGE 5, 6, AND 7)	72−35−65
EXIT GUIDE VANE HEAT SHIELD	72−35−66
HPC REAR SUPPORT	72−35−67
HPC INNER REAR CASE ASSEMBLY	72−35−68
HPC (OUTER) REAR CASE ASSEMBLY	72−35−69
HPC EXIT GUIDE VANE SUPPORT	72−35−70
GEARBOX DRIVESHAFT HOUSING SUPPORT CLEVIS	72−35−71
GEARBOX DRIVESHAFT HOUSING SUPPORT LINK	72−35−72
COMPRESSOR STATOR CYLINDER SUPPORT ASSEMBLY	72−35−73
HPC LEVER SET	72−35−74
STAGE 7 HPC LEVER	72−35−75
HPC CLEVISES	72−35−76
INTERNALLY THREADED ADJUSTERS	72−35−77
ROD END BEARINGS	72−35−78
HPC LEVER SET AND ACTUATOR BEARINGS	72−35−79
HPC HEAT SHIELDS	72−35−80
HEAT SHIELD RETAINERS	72−35−81
HPC SPACER SET	72−35−82
STAGE 8 HPC CASE ASSEMBLY	72−35−83
STAGE 9 HPC CASE ASSEMBLY	72−35−84

STAGE 10 HPC CASE ASSEMBLY	72-35-85
STAGE 11 HPC CASE ASSEMBLY	72-35-86
STAGE 12 HPC CASE ASSEMBLY	72-35-87
STAGE 13 HPC CASE ASSEMBLY	72-35-88
STAGE 14 HPC CASE ASSEMBLY	72-35-89
NO. 2 BEARING FRONT SEAL SEAT	72-35-90
PLAIN ROUND NUT (NO. 2 BEARING FRONT SEAL SEAT)	72-35-91
UNASSIGNED	72-35-92
STAGE 8 AIR SEAL SUPPORT SEGMENT SET	72-35-93
GEARBOX DRIVESHAFT HOUSING SUPPORT LINK SPHERICAL BEARINGS	72-35-94
NO. 2 BEARING RETAINING NUT	72-35-95
NO. 2 BEARING NUT LOCK	72-35-96
UNASSIGNED	72-35-97 And 72-35-98
HIGH PRESSURE COMPRESSOR (HPC) MISCELLANEOUS PARTS	72-35-99
DIFFUSER AND COMBUSTOR See Figure 10	72-41-00
DIFFUSER CASE ASSEMBLY	72-41-01
COMPRESSOR EXIT STATOR ASSEMBLY	72-41-02
STAGE 15 HPC AIRSEALING RING ASSEMBLY	72-41-03
STAGE 15 HPC AIRSEAL RING NOZZLE	72-41-04
DIFFUSER AIRSEALING RING ASSEMBLY	72-41-05
NO. 3 BEARING FRONT COOLING DUCT ASSEMBLY	72-41-06
NO. 3 BEARING FRONT (CARBON) SEAL ASSEMBLY	72-41-07
NO. 3 BEARING (FRONT) SEAL RING HOLDER ASSEMBLY	72-41-08

HOW TO USE MANUAL

NO. 3 BEARING (FRONT) FACE SEAL ASSEMBLY	72-41-09
NO. 3 BEARING HOUSING	72-41-10
OUTER COMBUSTION CHAMBER ASSEMBLY	72-41-11
DOWELED END (COMBUSTION CHAMBER RETAINING) BOLT	72-41-12
NOT USED	72-41-13 and 72-41-14
UNASSIGNED	72-41-15 through 72-41-18
NO. 3 BEARING (BREATHER) TUBE ASSEMBLY	72-41-19
NO. 3 BEARING (OIL) PRESSURE TUBE ASSEMBLY	72-41-20
NO. 3 BEARING PACKING TRANSFER (OIL PRESSURE) TUBE	72-41-21
NO. 3 BEARING AND AIRFRAME (OIL VENT AND TURBINE COOLING AIR DUCT SENSING OUTER) MANIFOLD ASSEMBLIES	72-41-22
TURBINE COOLING DUCT SENSING (INNER AIRFRAME) TUBE ASSEMBLY	72-41-23
NO. 3 BEARING OIL VENT (INNER) TUBE ASSEMBLY	72-41-24
NO. 3 BEARING (SCAVENGE) TUBE ASSEMBLY	72-41-25
NO. 3 BEARING PACKING TRANSFER (BREATHER AND SCAVENGE) TUBES	72-41-26
NO. 3 BEARING (COMPARTMENT) COOLING TUBE ASSEMBLY	72-41-27
SEAL RING TRANSFER (NO. 3 BEARING COOLING FRONT) TUBE	72-41-28
SEAL RING TRANSFER (NO. 3 BEARING COOLING RING) TUBE	72-41-29
NO. 3 BEARING ELBOW ASSEMBLY (NO. 3 BEARING COMPARTMENT COOLING TUBE)	72-41-30
TURBINE BLADE COOLING TUBES	72-41-31
SEAL RING TRANSFER (TURBINE BLADE COOLING) TUBE	72-41-32
DIFFUSER SEAL AIR VENT (ELBOW) TUBE ASSEMBLY	72-41-33

DIFFUSER SEAL AIR VENT TUBE ASSEMBLY	72-41-34
NO. 3 BEARING (OIL) NOZZLE ASSEMBLY	72-41-35
TUBE SEAL RINGS	72-41-36
TUBE SEALING SLEEVE	72-41-37
NOT USED	72-41-38
HPC EXIT BRUSH SEAL SUPPORT ASSEMBLY	72-41-39
FUEL NOZZLE SUPPLY MANIFOLD ASSEMBLY	72-41-40
HPC (REAR) EXIT BRUSH SEAL ASSEMBLY	72-41-41
UNASSIGNED	72-41-42 through 72-41-79
NO. 3 BEARING FRONT SEAL SEAT	72-41-80
NO. 3 BEARING SEAL SPACER	72-41-81
NO. 3 ROLLER BEARING	72-41-82
NO. 3 BEARING (OUTER RACE) RETAINING NUT	72-41-83
NO. 3 BEARING REAR SEAL SEAT	72-41-84
NO. 3 BEARING REAR (CARBON) SEAL ASSEMBLY	72-41-85
NO. 3 BEARING (REAR) SEAL RING HOLDER ASSEMBLY	72-41-86
NO. 3 BEARING (REAR) FACE SEAL ASSEMBLY	72-41-87
NO. 3 BEARING REAR COOLING DUCT ASSEMBLY	72-41-88
FUEL SUPPLY TUBE ASSEMBLIES	72-41-89
PACKING TRANSFER TUBE (FUEL SUPPLY TUBE TO MANIFOLD)	72-41-90
GEARBOX LUG GUIDE ASSEMBLY	72-41-91
GEARBOX SUPPORT CLEVIS, LEFT AND RIGHT	72-41-92
GEARBOX HEAT SHIELD ASSEMBLIES	72-41-93

UNASSIGNED	72–41–94 through 72–41–98
DIFFUSER AND COMBUSTOR MISCELLANEOUS PARTS	72–41–99
TURBINE NOZZLE See Figure 11	72–51–00
STAGE 1 (VANE) HPT SUPPORT ASSEMBLY	72–51–01
STAGE 1 HPT VANE/VANE CLUSTER ASSEMBLY	72–51–02
STAGE 1 HPT (BLADE) COOLING DUCT ASSEMBLY	72–51–03
HPT COOLING DUCT DEFLECTOR	72–51–04
INNER COMBUSTION CHAMBER ASSEMBLY	72–51–05
STAGE 1 HPT DUCT SEGMENT	72–51–06
STAGE 1 HPT DUCT STOP	72–51–07
COMBUSTION CHAMBER GUIDE ASSEMBLY (UPPER SEGMENT)	72–51–08
COMBUSTION CHAMBER GUIDE ASSEMBLY (LOWER SEGMENT)	72–51–09
COMBUSTION CHAMBER GUIDE PLATE ASSEMBLY	72–51–10
STAGE 1 HPT VANE SEALS	72–51–11
NOT USED	72–51–12 and 72–51–13
UNASSIGNED	72–51–14 through 72–51–79
COMBUSTION CHAMBER CLAMP ASSEMBLY	72–51–80
UNASSIGNED	72–51–81 through 72–51–98
TURBINE NOZZLE MISCELLANEOUS PARTS	72–51–99

HIGH PRESSURE TURBINE (HPT) . See Figure 12	72-52-00
STAGE 1 TURBINE ROTOR ASSEMBLY	72-52-01
STAGE 2 TURBINE ROTOR ASSEMBLY	72-52-02
TURBINE CASE AND VANE ASSEMBLY	72-52-03
NOT USED	72-52-04
TURBINE FRONT HUB (STAGE 1)	72-52-05
TURBINE INTERMEDIATE HUB (STAGE 2)	72-52-06
STAGE 1 HPT BLADE ASSEMBLY	72-52-07
STAGE 2 HPT BLADE ASSEMBLY	72-52-08
STAGE 1 HPT BLADE DAMPER	72-52-09
STAGE 2 HPT BLADE DAMPER	72-52-10
STAGE 1 HPT BLADE (HUB RIM) SEAL	72-52-11
STAGE 2 HPT BLADE (HUB RIM) SEAL	72-52-12
STAGE 1 HPT BLADE (HUB RIM) COVER	72-52-13
STAGE 2 HPT BLADE (HUB RIM) COVER	72-52-14
STAGE 1 HPT (BLADE) AIRSEAL	72-52-15
NOT USED	72-52-16 and 72-52-17
UNASSIGNED	72-52-18
NOT USED	72-52-19
STAGE 1 HPT (OUTER ROTATING) AIRSEAL	72-52-20
STAGE 1 HPT (INNER ROTATING) AIRSEAL	72-52-21
STAGE 2 HPT (ROTATING) AIRSEAL	72-52-22
STAGE 2 HPT BLADE RETAINING PLATE	72-52-23

STAGE 2 HPT (BLADE RETAINING PLATE) KEY	72−52−24
TURBINE HUB LOCK	72−52−25
NOT USED	72−52−26 and 72−52−27
UNASSIGNED	72−52−28 and 72−52−29
TURBINE CASE ASSEMBLY	72−52−30
STAGE 1 HPT DUCT SUPPORT (SEGMENT) ASSEMBLY	72−52−31
STAGE 1 HPT DUCT SEGMENT	72−52−32
STAGE 1 HPT (DUCT) BAND SEGMENT ASSEMBLY	72−52−33
STAGE 2 HPT RING SEGMENT AND VANE CLUSTER ASSEMBLY	72−52−34
STAGE 2 HPT DUCT SEGMENT	72−52−35
STAGE 2 HPT (DUCT) BAND SEGMENT ASSEMBLY	72−52−36
STAGE 2 HPT DUCT SUPPORT (SEGMENT)	72−52−37
STAGE 2 HPT (REAR CASE) SEAL	72−52−38
HPT DUCT SEGMENT AND VANE SEALS	72−52−39
NOT USED	72−52−40
UNASSIGNED	72−52−41 through 72−52−79
NO. 3 BEARING (AND HPT) RETAINING NUT	72−52−80
NO. 3 BEARING NUT LOCK	72−52−81
UNASSIGNED	72−52−82
TURBINE SHAFT SPACER	72−52−83
UNASSIGNED	72−52−84 through 72−52−98

HIGH PRESSURE TURBINE (HPT) MISCELLANEOUS PARTS	72-52-99
LOW PRESSURE TURBINE (LPT) See Figure 13	72-53-00
UNASSIGNED	72-53-01 and 72-53-02
STAGE 3 TURBINE ROTOR ASSEMBLY	72-53-03
STAGE 4 TURBINE ROTOR ASSEMBLY	72-53-04
STAGE 5 TURBINE ROTOR ASSEMBLY	72-53-05
STAGE 6 TURBINE ROTOR ASSEMBLY	72-53-06
STAGE 3 LPT BLADE	72-53-07
STAGE 4 LPT BLADE	72-53-08
STAGE 5 LPT BLADE	72-53-09
STAGE 6 LPT BLADE	72-53-10
NOT USED	72-53-11 and 72-53-12
STAGE 3 LPT DISK	72-53-13
STAGE 4 LPT DISK ASSEMBLY	72-53-14
STAGE 5 REAR TURBINE HUB	72-53-15
STAGE 6 LPT DISK ASSEMBLY	72-53-16
REAR TURBINE (LPT) CASE ASSEMBLY	72-53-17
STAGE 3 LPT (INNER) DUCT ASSEMBLY	72-53-18
STAGE 3 LPT (INNER) SEALING RING ASSEMBLY	72-53-19
STAGE 3 LPT (INNER) SEALING RING SUPPORT ASSEMBLY	72-53-20
STAGE 3 LPT (INNER) SEALING RING DAMPER	72-53-21
NOT USED	72-53-22

HOW TO USE MANUAL

STAGE 3 LPT VANE CLUSTER ASSEMBLY 72-53-23

STAGE 4 LPT VANE CLUSTER ASSEMBLY 72-53-24

STAGE 5 LPT VANE CLUSTER ASSEMBLY 72-53-25

STAGE 6 LPT VANE CLUSTER ASSEMBLY 72-53-26

STAGE 3 LPT VANE SEALS 72-53-27

NOT USED 72-53-28

STAGE 3 LPT (OUTER) DUCT SEGMENT ASSEMBLY 72-53-29

STAGE 3 LPT (OUTER) DUCT ASSEMBLY 72-53-30

STAGE 3 LPT (OUTER VANE) DUCT ASSEMBLY 72-53-31

STAGE 3 LPT (OUTER) AIRSEALING RING SEGMENT ASSEMBLY 72-53-32

STAGE 4 LPT (OUTER) AIRSEALING RING SEGMENT ASSEMBLY 72-53-33

STAGE 5 LPT (OUTER) AIRSEALING RING SEGMENT ASSEMBLY 72-53-34

STAGE 6 LPT (OUTER) AIRSEALING RING SEGMENT ASSEMBLY 72-53-35

NOT USED 72-53-36

STAGE 6 LPT (OUTER) AIRSEALING RING FLANGE 72-53-37

STAGE 3 LPT (INNER ROTATING) AIRSEAL 72-53-38

STAGE 3 LPT (OUTER ROTATING) AIRSEAL 72-53-39

STAGE 4 LPT (ROTATING) AIRSEAL 72-53-40

STAGE 5 LPT (ROTATING) AIRSEAL 72-53-41

NOT USED 72-53-42

TURBINE TIERODS 72-53-43

TURBINE TIEROD NUT 72-53-44

NOT USED 72-53-45
through
72-53-49

TURBINE CASE (STAGE 3 AIRSEALING RING) HEAT SHIELD ASSEMBLY	72-53-50
TURBINE CASE (STAGE 4 VANE) HEAT SHIELD ASSEMBLY	72-53-51
TURBINE CASE (STAGE 4 AIRSEALING RING) HEAT SHIELD ASSEMBLY	72-53-52
TURBINE CASE (STAGE 5 VANE) HEAT SHIELD ASSEMBLY	72-53-53
TURBINE CASE (STAGE 5 AIRSEALING RING) HEAT SHIELD ASSEMBLY	72-53-54
TURBINE CASE (STAGE 6 VANE) HEAT SHIELD ASSEMBLY	72-53-55
NOT USED	72-53-56 through 72-53-75
UNASSIGNED	72-53-76 and 72-53-79
FRONT COMPRESSOR DRIVE TURBINE (LPT) SHAFT	72-53-80
TURBINE SHAFT SPACER	72-53-81
TURBINE (SHAFT) TIEROD	72-53-82
TIEROD NUT	72-53-83
NO. 4 BEARING (INNER RACE) RETAINING PLATE	72-53-84
STAGE 6 LPT AIRSEAL	72-53-85
NOT USED	72-53-86 through 72-53-90
UNASSIGNED	72-53-91 through 72-53-98
LOW PRESSURE TURBINE (LPT) MISCELLANEOUS PARTS	72-53-99

HOW TO USE MANUAL

TURBINE EXHAUST CASE See Figure 14	72–54–00
TURBINE EXHAUST CASE ASSEMBLY	72–54–01
ENGINE SUPPORT CLEVIS BOSS ASSEMBLY	72–54–02
ENGINE SUPPORT BOSS PIN	72–54–03
UNASSIGNED	72–54–04 and 72–54–05
NOT USED	72–54–06
NO. 4 BEARING OIL PRESSURE TUBE ASSEMBLY	72–54–07
NO. 4 BEARING OIL SCAVENGE (OUTER) TUBE ASSEMBLY	72–54–08
NO. 4 BEARING OIL SCAVENGE (INNER) TUBE ASSEMBLY	72–54–09
NO. 4 BEARING (OIL) NOZZLE	72–54–10
NO. 4 BEARING TRANSFER TUBE (OIL NOZZLE TO BEARING HOUSING)	72–54–11
NO. 4 BEARING (PRESSURE AND SCAVENGE) TUBE GUIDES	72–54–12
NO. 4 BEARING (OUTER RACE) RETAINING PLATE	72–54–13
NO. 4 ROLLER BEARING	72–54–14
NO. 4 BEARING PRESSURE AND SCAVENGE TUBE HEAT SHIELD ASSEMBLIES	72–54–15
UNASSIGNED	72–54–16 through 72–54–18
TRANSFER TUBE (DAMPER TUBE TO FRONT NOZZLE)	72–54–19
NO. 4 BEARING DAMPER SUPPLY TUBE ASSEMBLY	72–54–20
FRONT NO. 4 BEARING NOZZLE ASSEMBLY	72–54–21
NOT USED	72–54–22
EEC PT4.95 MANIFOLD ASSEMBLY	72–54–23

HOW TO USE MANUAL

AVERAGE PRESSURE AND TEMPERATURE PROBE ASSEMBLY	72−54−24
THERMOCOUPLE HOUSING ASSEMBLY	72−54−25
NOT USED	72−54−26 through 72−54−34
NO. 4 BEARING SHIELD	72−54−35
NOT USED	72−54−36 through 72−54−40
UNASSIGNED	72−54−41 through 72−54−78
NOT USED	72−54−79
NO. 4 BEARING SEAL (FRONT) SPACER	72−54−80
NO. 4 BEARING (CARBON) FACE SEAL	72−54−81
NO. 4 BEARING SEAL (REAR) SPACER	72−54−82
NO. 4 BEARING COVER ASSEMBLY	72−54−83
NO. 4 BEARING (COVER) HEAT SHIELD ASSEMBLY	72−54−84
NO. 4 BEARING (COVER) SHIELD	72−54−85
NOT USED	72−54−86 through 72−54−89
UNASSIGNED	72−54−90 and 72−54−91
NOT USED	72−54−92 and 72−54−93
UNASSIGNED	72−54−94 through 72−54−98
TURBINE EXHAUST CASE MISCELLANOUS PARTS	72−54−99

MAIN GEARBOX See Figure 15	72-61-00
DEOILER IMPELLER, GEARSHAFT, AND BEARINGS ASSEMBLY	72-61-01
GEARBOX DRIVE GEARSHAFT AND BEARINGS ASSEMBLY	72-61-02
STARTER DRIVE GEARSHAFT AND BEARINGS ASSEMBLY	72-61-03
FUEL PUMP DRIVE GEARSHAFT AND BEARINGS ASSEMBLY	72-61-04
REAR HYDRAULIC PUMP DRIVE GEARSHAFT AND BEARINGS ASSEMBLY	72-61-05
IDG DRIVE GEARSHAFT AND BEARINGS ASSEMBLY	72-61-06
NOT USED	72-61-07
SCAVENGE PUMP DRIVE GEARSHAFT AND BEARING ASSEMBLY	72-61-08
EEC/PMA ALTERNATOR DRIVE GEARSHAFT AND BEARING ASSEMBLY	72-61-09
GEARBOX HOUSING ASSEMBLY	72-61-10
GEARBOX (DEOILER) SPUR GEARSHAFT ASSEMBLY	72-61-11
GEARBOX (DEOILER) BEARING HOUSING ASSEMBLY	72-61-12
GEARBOX BEARINGS	72-61-13
GEARBOX DEOILER IMPELLER SUPPORT	72-61-14
GEARBOX DEOILER IMPELLER ASSEMBLY	72-61-15
GEARBOX DEOILER IMPELLER LOCK	72-61-16
NOT USED	72-61-17
GEARBOX DEOILER HOUSING ASSEMBLY	72-61-18
FACE (OIL) SEAL ASSEMBLIES	72-61-19
GEARBOX IDLER SHAFT	72-61-20
GEARBOX (IDLER) SPUR GEAR	72-61-21
GEARBOX (DRIVE) SPUR GEARSHAFT	72-61-22

GEARBOX DRIVESHAFT HOUSING ASSEMBLY	72-61-23
GEARBOX (STARTER DRIVE) GEARSHAFT ASSEMBLY	72-61-24
GEARBOX (STARTER DRIVE) COUPLING	72-61-25
GEARBOX (STARTER DRIVE) BEARING HOUSING ASSEMBLY	72-61-26
GEARBOX (FUEL PUMP DRIVE) SPUR GEARSHAFT ASSEMBLY	72-61-27
GEARBOX (FUEL PUMP DRIVE) BEARING HOUSING ASSEMBLY	72-61-28
GEARBOX (REAR HYDRAULIC PUMP DRIVE) SPUR GEARSHAFT	72-61-29
GEARBOX (REAR HYDRAULIC PUMP DRIVE) BEARING HOUSING ASSEMBLY	72-61-30
GEARBOX (IDG DRIVE) SPUR GEARSHAFT ASSEMBLY	72-61-31
GEARBOX (IDG DRIVE) BEARING HOUSING ASSEMBLY	72-61-32
GEARBOX (FRONT HYDRAULIC PUMP DRIVE) BEARING HOUSING ASSEMBLY	72-61-33
GEARBOX (FRONT HYDRAULIC PUMP DRIVE) SPUR GEARSHAFT	72-61-34
GEARBOX (FRONT HYDRAULIC PUMP DRIVE) BEARING SUPPORT	72-61-35
FRONT HYDRAULIC PUMP DRIVE BEARINGS SLEEVE SPACER	72-61-36
ENGINE ACCESSORY DRIVE COVER	72-61-37
OIL RETAINER PLUG	72-61-38
NOT USED	72-61-39
SCAVENGE PUMP DRIVE IDLER GEARSHAFT AND BEARINGS ASSEMBLY	72-61-40
GEARBOX (SCAVENGE PUMP DRIVE) SPUR GEARSHAFT	72-61-41
GEARBOX (SCAVENGE PUMP DRIVE) BEARING HOUSING ASSEMBLY	72-61-42
COVER (MANUAL CRANK)	72-61-43
SCAVENGE PUMP SPUR GEARSHAFT	72-61-44
GEARBOX (EEC/PMA ALTERNATOR DRIVE) SPUR GEARSHAFT	72-61-45

GEARBOX (EEC/PMA ALTERNATOR DRIVE) BEARING SPACER	72-61-46
GEARBOX GENERATOR (EEC/PMA ALTERNATOR) HOUSING ASSEMBLY	72-61-47
GEARBOX BEARING SEAL SEAT	72-61-48
EEC/PMA ALTERNATOR ROTOR SLEEVE SPACER	72-61-49
NOT USED	72-61-50
GEARBOX PRESSURE MANIFOLD ASSEMBLY	72-61-51
NOT USED	72-61-52
GEARBOX NOZZLE ASSEMBLY	72-61-53
GEARBOX NOZZLE BUSHING	72-61-54
GEARBOX (EEC/PMA ALTERNATOR) NOZZLE	72-61-55
GEARBOX DRIVESHAFT NOZZLE	72-61-56
GEARBOX DRIVESHAFT PRESSURE TUBE ASSEMBLY	72-61-57
NOT USED	72-61-58 and 72-61-59
MAIN OIL FILTER HOUSING ASSEMBLY	72-61-60
RELIEF VALVE HOUSING (PRESSURE REGULATOR)	72-61-61
PRESSURE (REGULATOR) RELIEF VALVE	72-61-62
RELIEF VALVE PLUG AND SPRING	72-61-63
MAIN OIL STRAINER (FILTER) COVER ASSEMBLY	72-61-64
PRESSURE RELIEF VALVE (FILTER ELEMENT)	72-61-65
PACKING TRANSFER TUBES	72-61-66
UNASSIGNED	72-61-67
GEARBOX LUG	72-61-68
OIL TANK DEAERATOR ASSEMBLY	72-61-69

HOW TO USE MANUAL

GEARBOX SEALING SLEEVE	72−61−70
OIL CHECK VALVE ASSEMBLY	72−61−71
OIL CHECK VALVE HOUSING	72−61−72
LUBE OIL TANK ASSEMBLY	72−61−73
OIL TANK HEAT SHIELD ASSEMBLY	72−61−74
OIL TANK SUMP ASSEMBLY	72−61−75
NOT USED	72−61−76
UNASSIGNED	72−61−77
OIL TANK BREATHER TUBE	72−61−78
UNASSIGNED	72−61−79
GEARBOX DRIVESHAFT	72−61−80
GEARBOX DRIVESHAFT (FRONT) HOUSING/HOUSING AND STRAINER ASSEMBLY	72−61−81
UNASSIGNED	72−61−82
GEARBOX DRIVESHAFT HOUSING SUPPORT LINK SHOULDERED BOLT	72−61−83
GEARBOX SUPPORT LINK	72−61−84
NOT USED	72−61−85
GEARBOX SUPPORT LINK UPPER HOLLOW PINS	72−61−86
GEARBOX SUPPORT LINK LOWER HOLLOW PINS	72−61−87
GEARBOX SUPPORT LINK UPPER BOLTS	72−61−88
GEARBOX SUPPORT LINK LOWER BOLTS	72−61−89
GEARBOX SUPPORT LINK UPPER PIN SPACERS	72−61−90
GEARBOX SUPPORT LINK LOWER PIN SPACERS	72−61−91
NOT USED	72−61−92 through 72−61−96

HOW TO USE MANUAL

UNASSIGNED	72-61-97 and 72-61-98

PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

R ## ENGINE - INSTRUCTIONS FOR CONTINUED AIRWORTHINESS - TIME LIMITS

Task 05-10-00-990-013:

R ### 1. Instructions For Continued Airworthiness - General

R A. General

R (1) The information published by Pratt & Whitney in Section 05-10-01, Airworthiness Limitations of this manual identifies the maximum hours and/or cycles that certain parts may operate prior to removal. In addition this section may identify maintenance actions that must be taken at specified intervals. This information is provided in compliance with the United States Code of Federal Regulations, Title 14, Aeronautics and Space, Part 33 - Airworthiness Standards: Aircraft Engines, paragraph 33.4 Appendix A. Paragraph 33.4 Appendix A specifies, in part, that an Airworthiness Limitations section must be provided that is segregated and distinguished from the rest of the text. Information in this section must contain "each mandatory replacement time, structural inspection interval, and related structural inspection procedure, including envelope structural integrity, required for type certification."

R (2) The information supplied by Pratt & Whitney in Section 05-10-01, Airworthiness Limitations of this manual should be utilized in consideration of the clarifying statements provided in paragraph (3)(a). These clarifying statements are consistent with regulatory guidance material provided to all engine manufacturers by the European Aviation Safety Agency. Reference is made to: European Aviation Safety Agency, Certification Specifications for Engines, CS-E Book 2 - Acceptable Means of Compliance, Subpart D - Turbine Engines; Design and Construction, AMC to CS-E515 Engine Critical Parts, effective November 24, 2003.

R (3) Paragraph (3)(a) clarifying statements apply to the life limits provided by Pratt & Whitney in Chapter/Section 05-10-01, Airworthiness Limitations of this manual:

R (a) The following airworthiness limitations have been substantiated based on engineering analysis that assumes this product will be operated and maintained using the procedures and inspections provided in the Instructions for Continued Airworthiness supplied with this product by the Type Certificate holder or its licensees. For engine−critical parts and parts that influence engine−critical parts, any repair, modification, or maintenance procedures not approved by the Type Certificate holder or its licensees, or any substitution of such parts not supplied by the Type Certificate holder or its licensees may materially affect these limits.

CAUTION: THE FOLLOWING STATEMENTS APPLY TO PARTS DEFINED IN CHAPTER/SECTION 05−10−01, AIRWORTHINESS LIMITATIONS AND TO PARTS THAT ARE DIRECTLY ATTACHED TO THE PARTS DEFINED IN CHAPTER/SECTION 05−10−01, AIRWORTHINESS LIMITATIONS.

(4) Pratt & Whitney is unable to state that the information published in Chapter/Section 05−10−01, Airworthiness Limitations of this manual applies to replacement parts, repairs, modifications, or maintenance procedures not developed by, or in partnership with, Pratt & Whitney. Pratt & Whitney does not have access to the approved technical data associated with replacement parts, repairs, modifications, or maintenance procedures not developed by, or in partnership with, Pratt & Whitney. Without analysis of the approved technical data, Pratt & Whitney is unable to state that the data published in Chapter/Section 05−10−01, Airworthiness Limitations of this manual applies. In such situations, the entity responsible for the continued airworthiness of the engine may want to contact the company or person that received approval for the manufacture and /or sale of replacement parts(s) or approval for repairs, modifications, or maintenance procedures, to determine the methodology used to determine that the United States Code of Federal Regulations, Title 14, Aeronautics and Space, Part 33 − Airworthiness Standards: Aircraft Engines continues to be met, and to determine the appropriate life limitations for continued use of the part(s).

R ENGINE − INSTRUCTIONS FOR CONTINUED AIRWORTHINESS − TIME LIMITS

Task 05−10−00−990−015:

R 2. Instructions For Airworthiness Limitations − General

R A. Airworthiness Limitations

R (1) Refer to Chapter/Section 05−10−01 of this Manual for information that sets forth those parts that must be replaced on a mandatory basis upon the expiration of the Flight Cycles stated therein.

R B. Airworthiness Directives

R (1) Refer to Chapter/Section 05−10−02 of this Manual for information on Airworthiness Directives. This section gives information which associates the Airworthiness Directive with the subject matter and the related Pratt & Whitney Service Bulletin. This information is cross−referenced with the use of the tabular format.

R C. Time Limited Dispatch Criteria

R (1) Refer to Chapter/Section 05−10−03 of this Manual for information on Time Limited Dispatch Criteria. These criteria exist as dispatch and maintenance requirements for the engine control system. This section provides restrictions on the maximum operating intervals.

R D. Maintenance Advisory Notices (MANs)

R (1) Refer to Chapter/Section 05−10−04 of this Manual for information on Maintenance Advisory Notices (MANs). This is an advisory (not a mandatory directive) that gives the operator information on recommended maintenance actions of a repetitive nature. It also provides an implementation procedure which cites the necessary material resources.

ENGINE - INSTRUCTIONS FOR CONTINUED AIRWORTHINESS - TIME LIMITS

Task 05-10-00-990-031:

1. Instructions For Continued Airworthiness - General

A. General

(1) The information published by Pratt & Whitney in Section 05-10-01, Airworthiness Limitations of this manual identifies the maximum hours and/or cycles that certain parts may operate prior to removal. In addition this section may identify maintenance actions that must be taken at specified intervals. This information is provided in compliance with the United States Code of Federal Regulations, Title 14, Aeronautics and Space, Part 33 - Airworthiness Standards: Aircraft Engines, paragraph 33.4 Appendix A. Paragraph 33.4 Appendix A specifies, in part, that an Airworthiness Limitations section must be provided that is segregated and distinguished from the rest of the text. Information in this section must contain "each mandatory replacement time, structural inspection interval, and related structural inspection procedure, including envelope structural integrity, required for type certification."

(2) The information supplied by Pratt & Whitney in Section 05-10-01, Airworthiness Limitations of this manual should be utilized in consideration of the clarifying statements provided in paragraph (3)(a). These clarifying statements are consistent with regulatory guidance material provided to all engine manufacturers by the European Aviation Safety Agency. Reference is made to: European Aviation Safety Agency, Certification Specifications for Engines, CS-E Book 2 - Acceptable Means of Compliance, Subpart D - Turbine Engines; Design and Construction, AMC to CS-E515 Engine Critical Parts, effective November 24, 2003.

(3) Paragraph (3)(a) clarifying statements apply to the life limits provided by Pratt & Whitney in Chapter/Section 05-10-01, Airworthiness Limitations of this manual:

(a) The following airworthiness limitations have been substantiated based on engineering analysis that assumes this product will be operated and maintained using the procedures and inspections provided in the Instructions for Continued Airworthiness supplied with this product by the Type Certificate holder or its licensees. For engine-critical parts and parts that influence engine-critical parts, any repair, modification, or maintenance procedures not approved by the Type Certificate holder or its licensees, or any substitution of such parts not supplied by the Type Certificate holder or its licensees may materially affect these limits.

CAUTION: THE FOLLOWING STATEMENTS APPLY TO PARTS DEFINED IN CHAPTER/SECTION 05-10-01, AIRWORTHINESS LIMITATIONS AND TO PARTS THAT ARE DIRECTLY ATTACHED TO THE PARTS DEFINED IN CHAPTER/SECTION 05-10-01, AIRWORTHINESS LIMITATIONS.

(4) Pratt & Whitney is unable to state that the information published in Chapter/Section 05-10-01, Airworthiness Limitations of this manual applies to replacement parts, repairs, modifications, or maintenance procedures not developed by, or in partnership with, Pratt & Whitney. Pratt & Whitney does not have access to the approved technical data associated with replacement parts, repairs, modifications, or maintenance procedures not developed by, or in partnership with, Pratt & Whitney. Without analysis of the approved technical data, Pratt & Whitney is unable to state that the data published in Chapter/Section 05-10-01, Airworthiness Limitations of this manual applies. In such situations, the entity responsible for the continued airworthiness of the engine may want to contact the company or person that received approval for the manufacture and /or sale of replacement parts(s) or approval for repairs, modifications, or maintenance procedures, to determine the methodology used to determine that the United States Code of Federal Regulations, Title 14, Aeronautics and Space, Part 33 − Airworthiness Standards: Aircraft Engines continues to be met, and to determine the appropriate life limitations for continued use of the part(s).

R ENGINE − INSTRUCTIONS FOR CONTINUED AIRWORTHINESS − TIME LIMITS

Task 05−10−00−990−011:

R 2. Instructions For Airworthiness Limitations − General

R A. Airworthiness Limitations

R (1) Refer to Chapter/Section 05−10−01 of this Manual for
R information that sets forth those parts that must be
R replaced on a mandatory basis upon the expiration of
R the Flight Cycles stated therein.

R B. Airworthiness Directives

R (1) Refer to Chapter/Section 05−10−02 of this Manual for
R information on Airworthiness Directives. This section
R gives information which associates the Airworthiness
R Directive with the subject matter and the related Pratt
R & Whitney Service Bulletin. This information is
R cross−referenced with the use of the tabular format.

R C. Time Limited Dispatch Criteria

R (1) Refer to Chapter/Section 05−10−03 of this Manual for
R information on Time Limited Dispatch Criteria. These
R criteria exist as dispatch and maintenance requirements
R for the engine control system. This section provides
R restrictions on the maximum operating intervals.

R D. Maintenance Advisory Notices (MANs)

R (1) Refer to Chapter/Section 05−10−04 of this Manual for
R information on Maintenance Advisory Notices (MANs).
R This is an advisory (not a mandatory directive)
R that gives the operator information on recommended
R maintenance actions of a repetitive nature. It also
R provides an implementation procedure which cites the
R necessary material resources.

Previous Pageblock   Return to Previous Menu   Next Pageblock

R ENGINE - AIRWORTHINESS LIMITATIONS - TIME LIMITS

R Task 05-10-01-990-001:

R 1. Airworthiness Limitations

R A. The Airworthiness Limitations section is FAA approved
R and specifies maintenance required under sections 43.16
R and 91.403 of the Federal Aviation Regulations unless an
R alternative program has been FAA approved.

R B. See Paragraph 2. for Mixed Model Management Of Rotating
R Parts

R C. See Paragraph 3. for Hourly Limited Parts

R D. See Paragraph 4. for Life Cycles For Models

R E. See Paragraph 5. for Critical Life Limited Part Inspection

R F. See Paragraph 6. for Rotating Part Life Limits

R Task 05-10-01-990-002:

R 2. Mixed Model Management Of Rotating Parts

R A. Service life cycle limits for rotating parts used across
R PW4000 Engine Models can be calculated by one of the
R following methods:

R (1) Method 1. This method requires a record of the PW4000
R Engine Models on which the rotating part was used.
R And, if applicable, the THRUST LEVEL at which those
R engine models were operated.

R (a) In the following tables, find the life cycles
R listed for each of the engine models the part was
R used on. Assign the LOWEST cycle limit to that
R part.

R (b) If the rotating part was operated across PW4000
R engine models at varying THRUST LEVELS, assign the
R life cycle limit for the engine model run at the
R higher THRUST. Remember, the LOWEST life cycle...
R highest THRUST LEVEL prevails, EXCEPT if records
R prove the part was never run on a given model, or
R never subjected to the higher THRUST LEVEL.

R (2) Method 2. This method provides a formula for
R determining, on a prorated basis, the TOTAL life cycle
R limit for a part used on more than one PW4000 Model.
R See Figure 801.

R ENGINE - AIRWORTHINESS LIMITATIONS - TIME LIMITS

$$1.00 - \left[\frac{\text{Model 1 Cycles}}{\text{Model 1 Certified Cycles}}\right] - \left[\frac{\text{Model 2 Cycles}}{\text{Model 2 Certified Cycles}}\right] - \left[\frac{\text{Model N Cycles}}{\text{Model N Certified Cycles}}\right] = 0$$

(a) For example: If a disk has accumulated 6000 Cycles in Model 1 (certified for 20000 Cycles) , and 4500 Cycles in Model 2 (certified for 15000 Cycles) , the remaining life in either model would be determined by transposing the above equation as follows:

- $$\text{Remaining Model 1 Cycles} = \left[\text{Model 1 Certified Cycles}\right] - \left[\frac{(\text{Model 1 Cycles})\ (\text{Model 1 Certified Cycles})}{\text{Model 1 Certified Cycles}}\right] - \left[\frac{(\text{Model 2 Cycles})\ (\text{Model 1 Certified Cycles})}{\text{Model 2 Certified Cycles}}\right]$$

- $$\text{Remaining Model 2 Cycles} = \left[\text{Model 2 Certified Cycles}\right] - \left[\frac{(\text{Model 2 Cycles})\ (\text{Model 2 Certified Cycles})}{\text{Model 2 Certified Cycles}}\right] - \left[\frac{(\text{Model 1 Cycles})\ (\text{Model 2 Certified Cycles})}{\text{Model 1 Certified Cycles}}\right]$$

Inserting proper values for this example:

- $$\text{Remaining Model 1 Cycles} = \left[20000\right] - \left[\frac{(6000)\ (20000)}{20000}\right] - \left[\frac{(4500)\ (20000)}{15000}\right] = 8000$$

- $$\text{Remaining Model 2 Cycles} = \left[15000\right] - \left[\frac{(4500)\ (15000)}{15000}\right] - \left[\frac{(6000)\ (15000)}{20000}\right] = 6000$$

L-D3483 (0806)

R Mixed Model Rotating Part Life Formula
R Figure 801
R (Task 05-10-01-990-002)

ENGINE − AIRWORTHINESS LIMITATIONS − TIME LIMITS

Task 05−10−01−990−003:

3. Hourly Limited Parts

A. In establishing and reporting time on hourly limited parts, time is defined as that accumulated time from the moment an aircraft leaves the surface of the earth until it touches it at the next point of landing.

The cycle limits associated with specific part numbers contained in the following tables were submitted to and accepted by the Federal Aviation Administration (FAA) as part of Pratt & Whitney engine certification documentation for the engine models which utilize these parts. The listed part numbers are either detail parts or part assemblies.

If the part is an assembly, the word "Assy" appears in the PART NO. column. If the part is an assembly, the assembly part number is provided and the associated detail part number appears indented (.xxxx) directly below the assembly part number. This detail part number is the part within the assembly which is structurally associated with the cycle limit even though the cycle limit may appear next to the assembly part number.

If the documentation submitted to the FAA specified the cycle limit next to the assembly part number, the cycle limit will appear next to the assembly part number and the word "Reference" will appear next to the detail part number. In this situation, the detail part number carries the same cycle limit as the assembly part number. If the documentation submitted to the FAA specified the cycle limit next to the detail part number, the cycle limit will appear next to the detail part number and the word "Reference" will appear next to the assembly part number. In this situation, the assembly part number carries the same cycle limit as the detail part number.

Detail parts of assemblies, unless listed in the following tables, do not carry a cycle limit. Example: If a disk assembly has mechanically attached parts such as fasteners, metering plugs or balance weights, the cycle limit tables show a cycle limit for the disk assembly and the detail disk is shown as a "Reference". The attached parts are not listed in the tables and are not cycle limited. The disk assembly and the disk must both comply with the cycle limit shown in the table.

Task 05-10-01-990-004:

4. Life Cycles for Models

A. Hardware found on modified models listed below have the same cyclic life as the corresponding base model or (-3) model, as applicable, unless specified differently.

(1) Life limited hardware used on the base model can also be used on the modified models listed below through the listed service bulletin:

BASE MODEL	MODIFIED MODEL
	SB PW4ENG 72-516
PW4152	PW4152 (-1C/-1E)

(2) Life limited hardware used on Phase III "(-3)" engines as built by Pratt & Whitney can also be used on the modified models listed below through the listed service bulletin:

BASE MODEL	MODIFIED MODEL
Phase III (-3) ENGINES AS BUILT BY PRATT & WHITNEY OR CONVERTED PHASE III ENGINES BY SB PW4ENG 72-572	
	SB PW4ENG 73-150
PW4152 (-3)	PW4152 (-3A)

(3) This document is Part Number/Cycle Max Replace At based and is not base upon engine model designation other than to denote thrust level.

Task 05-10-01-990-005:

5. Critical Life Limited Part Inspection

A. Inspection Requirement

(1) This section has the definitions for the individual engine piece part opportunity and the inspection procedures which are necessary when these parts are removed from the engine.

(2) For the purposes of these mandatory enhanced inspections, piece part opportunity means:

(a) The part is considered completely disassembled when accomplished in accordance with the disassembly instructions in the engine manual to either the part detail or part assembly level part numbers for the parts listed in the Table; and

(b) The part has accumulated more than 100 cycles in service since the last piece part opportunity inspection, provided that the part was not damaged by or related to the cause for its removal from the engine.

(3) The inspections specified in this section do not replace or make not necessary other recommended inspections for these parts or other parts.

B. Parts Requiring Inspection:

DESCRIPTION	PART NUMBER	CIR MANUAL SECTION	CIR MANUAL INSPECTION	CIR MANUAL
Hub, Front Compressor	ALL	72−31−07	I/C−02	PN 51A357

NOTE: FAA Airworthiness Directive 2005−25−09 (Effective June 12,2006) mandates compliance with PW4000 Series Engine CIR Manual (PN 51A357), 72−31−07, Inspection/Check−02 CONFIG−1, (Task 72−31−07−200−002) (Non−Destructive Inspection − Front Compressor Hub Assembly).

DESCRIPTION	PART NUMBER	CIR MANUAL SECTION	CIR MANUAL INSPECTION	CIR MANUAL
Hub, Turbine Front (Stage 1)	ALL	72−52−05	I/C−02	PN 51A357
Hub, Turbine Intermediate Rear (Stage 2)	All	72−52−06	I/C−02	PN 51A357
Disk, Stage 5	All	72−35−06	I/C−02	PN 51A357
Disk, Drum Rotor Stage (6 Thru 12)	All	72−35−07	I/C−02	PN 51A357

(CONTINUED)

DESCRIPTION	PART NUMBER	CIR MANUAL SECTION	CIR MANUAL INSPECTION	CIR MANUAL
Disk, Drum Rotor (Stages 13, 14 And 15)	All	72–35–08 (See Note 1)	I/C–02	PN 51A357
Disk, Drum Rotor (Stages 13, 14 And 15)	All	72–35–10 (See Note 2)	I/C–02	PN 51A357
Disk, LPT Stage 3	All	72–53–13	I/C–02	PN 51A357
Disk, LPT Stage 4	All	72–53–14	I/C–02	PN 51A357

Disk, LPT Stage 6	All	72–53–16	I/C–02	PN 51A357

NOTE: (1) Applicable for the PW4152 engine model and engines incorporating SB PW4ENG 72–572 only.

NOTE: (2) Applicable for the PW4152–3 engine model only.

Task 05–10–01–990–006:

6. Rotating Part Life

Table 801, Table 802, Table 803, Table 804, and Table 805.

A. Service life is limited to, and must not exceed the cycles, specified in the following tables. If the rotating part has been used in more than one engine model, refer to Paragraph 4.

R ENGINE - AIRWORTHINESS LIMITATIONS - TIME LIMITS

R B. In establishing and reporting cycles accumulated on cyclically limited parts, cycles are defined as any flight consisting of one take-off and landing regardless of length of flight or whether or not thrust reverser (if so equipped) was used. For further clarification, Refer to Task 70-30-00-200-002, Section 70-30-00, General-01 in the Standard Practices Manual.

R C. In computing rotating part life, calculations must include cycles since time of manufacture. Changes to part life cycle limits resulting from reoperation, use in different thrust level engines, or for any other reason, must be calculated on the basis of total cycles.

R D. All life cycle limits indicate total cycles accumulated prior to and subsequent to reoperation and reidentification.

R E. The information in the following tables is not intended as authority for interchangeability. Refer to applicable service bulletins for interchangeability information.

ENGINE − AIRWORTHINESS LIMITATIONS − TIME LIMITS

Task 05−10−01−990−007:

1. Airworthiness Limitations

A. The Airworthiness Limitations section is FAA approved and specifies maintenance required under sections 43.16 and 91.403 of the Federal Aviation Regulations unless an alternative program has been FAA approved.

B. See Paragraph 2. for Mixed Model Management Of Rotating Parts

C. See Paragraph 3. for Hourly Limited Parts

D. See Paragraph 4. for Life Cycles For Models

E. See Paragraph 5. for Critical Life Limited Part Inspection

F. See Paragraph 6. for Rotating Part Life Limits

Task 05−10−01−990−008:

2. Mixed Model Management Of Rotating Parts

A. Service life cycle limits for rotating parts used across PW4000 Engine Models can be calculated by one of the following methods:

(1) Method 1. This method requires a record of the PW4000 Engine Models on which the rotating part was used. And, if applicable, the THRUST LEVEL at which those engine models were operated.

(a) In the following tables, find the life cycles listed for each of the engine models the part was used on. Assign the LOWEST cycle limit to that part.

(b) If the rotating part was operated across PW4000 engine models at varying THRUST LEVELS, assign the life cycle limit for the engine model run at the higher THRUST. Remember, the LOWEST life cycle... highest THRUST LEVEL prevails, EXCEPT if records prove the part was never run on a given model, or never subjected to the higher THRUST LEVEL.

(2) Method 2. This method provides a formula for determining, on a prorated basis, the TOTAL life cycle limit for a part used on more than one PW4000 Model. See Figure 801.

$$1.00 - \left[\frac{\text{Model 1 Cycles}}{\text{Model 1 Certified Cycles}}\right] - \left[\frac{\text{Model 2 Cycles}}{\text{Model 2 Certified Cycles}}\right] - \left[\frac{\text{Model N Cycles}}{\text{Model N Certified Cycles}}\right] = 0$$

(a) For example: If a disk has accumulated 6000 Cycles in Model 1 (certified for 20000 Cycles) , and 4500 Cycles in Model 2 (certified for 15000 Cycles) , the remaining life in either model would be determined by transposing the above equation as follows:

- Remaining Model 1 Cycles $= \left[\text{Model 1 Certified Cycles}\right] - \left[\frac{(\text{Model 1 Cycles})\ (\text{Model 1 Certified Cycles})}{\text{Model 1 Certified Cycles}}\right] - \left[\frac{(\text{Model 2 Cycles})\ (\text{Model 1 Certified Cycles})}{\text{Model 2 Certified Cycles}}\right]$

- Remaining Model 2 Cycles $= \left[\text{Model 2 Certified Cycles}\right] - \left[\frac{(\text{Model 2 Cycles})\ (\text{Model 2 Certified Cycles})}{\text{Model 2 Certified Cycles}}\right] - \left[\frac{(\text{Model 1 Cycles})\ (\text{Model 2 Certified Cycles})}{\text{Model 1 Certified Cycles}}\right]$

Inserting proper values for this example:

- Remaining Model 1 Cycles $= \left[20000\right] - \left[\frac{(6000)\ (20000)}{20000}\right] - \left[\frac{(4500)\ (20000)}{15000}\right] = 8000$

- Remaining Model 2 Cycles $= \left[15000\right] - \left[\frac{(4500)\ (15000)}{15000}\right] - \left[\frac{(6000)\ (15000)}{20000}\right] = 6000$

R (Task 05−10−01−990−008)

ENGINE − AIRWORTHINESS LIMITATIONS − TIME LIMITS

Task 05−10−01−990−009:

3. Hourly Limited Parts

A. In establishing and reporting time on hourly limited parts, time is defined as that accumulated time from the moment an aircraft leaves the surface of the earth until it touches it at the next point of landing.

The cycle limits associated with specific part numbers contained in the following tables were submitted to and accepted by the Federal Aviation Administration (FAA) as part of Pratt & Whitney engine certification documentation for the engine models which utilize these parts. The listed part numbers are either detail parts or part assemblies.

If the part is an assembly, the word "Assy" appears in the PART NO. column. If the part is an assembly, the assembly part number is provided and the associated detail part number appears indented (.xxxx) directly below the assembly part number. This detail part number is the part within the assembly which is structurally associated with the cycle limit even though the cycle limit may appear next to the assembly part number.

If the documentation submitted to the FAA specified the cycle limit next to the assembly part number, the cycle limit will appear next to the assembly part number and the word "Reference" will appear next to the detail part number. In this situation, the detail part number carries the same cycle limit as the assembly part number. If the documentation submitted to the FAA specified the cycle limit next to the detail part number, the cycle limit will appear next to the detail part number and the word "Reference" will appear next to the assembly part number. In this situation, the assembly part number carries the same cycle limit as the detail part number.

Detail parts of assemblies, unless listed in the following tables, do not carry a cycle limit. Example: If a disk assembly has mechanically attached parts such as fasteners, metering plugs or balance weights, the cycle limit tables show a cycle limit for the disk assembly and the detail disk is shown as a "Reference". The attached parts are not listed in the tables and are not cycle limited. The disk assembly and the disk must both comply with the cycle limit shown in the table.

Task 05−10−01−990−010:

4. Life Cycles for Models

A. Hardware found on modified models listed below have the same cyclic life as the corresponding base model or (−3) model, as applicable, unless specified differently.

(1) Life limited hardware used on the base model can also be used on the modified models listed below through the listed service bulletin:

BASE MODEL	MODIFIED MODEL
	SB PW4ENG 72−516
PW4156A	PW4156A (−1C/−1E)
PW4158	PW4158 (−1C/−1E)

(2) Life limited hardware used on Phase III "(−3)" engines as built by Pratt & Whitney can also be used on the modified models listed below through the listed service bulletin:

BASE MODEL	MODIFIED MODEL
Phase III (−3) ENGINES AS BUILT BY PRATT & WHITNEY OR CONVERTED PHASE III ENGINES BY SB PW4ENG 72−572 SB PW4ENG 73−150	
PW4156A (−3)	PW4156A (−3A)
PW4158 (−3)	PW4158 (−3A)

(3) This document is Part Number/Cycle Max Replace At based and is not base upon engine model designation other than to denote thrust level.

Task 05−10−01−990−011:

5. Critical Life Limited Part Inspection

A. Inspection Requirement

(1) This section has the definitions for the individual engine piece part opportunity and the inspection procedures which are necessary when these parts are removed from the engine.

(2) For the purposes of these mandatory enhanced inspections, piece part opportunity means:

(a) The part is considered completely disassembled when accomplished in accordance with the disassembly instructions in the engine manual to either the part detail or part assembly level part numbers for the parts listed in the Table; and

(b) The part has accumulated more than 100 cycles in service since the last piece part opportunity inspection, provided that the part was not damaged by or related to the cause for its removal from the engine.

(3) The inspections specified in this section do not replace or make not necessary other recommended inspections for these parts or other parts.

B. Parts Requiring Inspection:

DESCRIPTION	PART NUMBER	CIR MANUAL SECTION	CIR MANUAL INSPECTION	CIR MANUAL
Hub, Front Compressor	ALL	72−31−07	I/C−02	PN 51A357

NOTE: FAA Airworthiness Directive 2005−25−09 (Effective June 12,2006) mandates compliance with PW4000 Series Engine CIR Manual (PN 51A357), 72−31−07, Inspection/Check−02 CONFIG−1, (Task 72−31−07−200−002) (Non−Destructive Inspection − Front Compressor Hub Assembly).

NOTE: (2) Applicable for the PW4156A-3 and PW4158-3 engine models only.

Task 05-10-01-990-012:

6. Rotating Part Life

Table 801, Table 802, Table 803, Table 804, and Table 805.

A. Service life is limited to, and must not exceed the cycles, specified in the following tables. If the rotating part has been used in more than one engine model, refer to Paragraph 4.

B. In establishing and reporting cycles accumulated on cyclically limited parts, cycles are defined as any flight consisting of one take-off and landing regardless of length of flight or whether or not thrust reverser (if so equipped) was used. For further clarification, Refer to Task 70-30-00-200-002, Section 70-30-00, General-01 in the Standard Practices Manual.

R ENGINE − AIRWORTHINESS LIMITATIONS − TIME LIMITS

R C. In computing rotating part life, calculations must include cycles since time of manufacture. Changes to part life cycle limits resulting from reoperation, use in different thrust level engines, or for any other reason, must be calculated on the basis of total cycles.

R D. All life cycle limits indicate total cycles accumulated prior to and subsequent to reoperation and reidentification.

R E. The information in the following tables is not intended as authority for interchangeability. Refer to applicable service bulletins for interchangeability information.

ENGINE - AIRWORTHINESS DIRECTIVES - TIME LIMITS

Task 05-10-02-990-001:

1. Airworthiness Directives

A. The following Airworthiness Directives listed in Table 801, which affect Pratt & Whitney PW4000 Engines, have been issued by the Federal Aviation Agency. This listing is provided as a historical record for the convenience of PW4000 Engine Operators, and to ensure that all operators are aware of these safety requirements specified for Pratt & Whitney PW4000 Engines.

B. The tabular format is provided as a cross-reference index to associate the Airworthiness Directive with the subject matter and the related Pratt & Whitney Service Bulletin. See the listed documents to establish specific application.

C. Copies of the documents listed in Table 801 will be made available upon request. Please address requests for Airworthiness Directives to:

Manager, Engine Certification Office,
ANE-140 Aircraft Certification Division,
Federal Aviation Administration, New England Region,
12 New England Executive Park,
Burlington, MA 01803 USA

Service Bulletins can be obtained from:

Pratt & Whitney
Attn: Manager Maintenance Data Engineering
400 Main St.
M/S 132-30
East Hartford, CT 06108 USA

Airworthiness Directive	Status	Subject	Effectivity	Applicable Service Bulletin

ENGINE - TIME LIMITED DISPATCH CRITERIA - TIME LIMITS

Task 05-10-03-990-001:

1. Time Limited Dispatch Criteria

NOTE: Step A. is "NOTE 19" as excerpted from the "PW4000 TYPE CERTIFICATE DATA SHEET NUMBER E24NE".

A. The PW4000 series engines have been approved to operate with certain faults present in the control system based on satisfaction of FAR 33 requirements and appropriate FAR 25 control system reliability requirements. The following criteria exist as dispatch and maintenance requirements for the engine control system.

This criteria is specified in Pratt & Whitney Report PWA 6139 and PWA 6139 Addendum, which defines the various configurations and maximum operating intervals, as follows.

Faults Levels A, B, and C constitute Pratt & Whitney nomenclature. The airframe manufacturers may use different nomenclature in adapting these fault categories to the aircraft maintenance and display systems, however, the maximum operating intervals are restricted as shown above.

A control system reliability monitoring program has been established with Pratt & Whitney in compliance with the reporting requirements as outlined in the Engine and Propeller Directorate Policy letter, dated October 28, 1993, for Time Limited Dispatch of Engines fitted with FADEC Systems.

B. In Airbus installations Fault Level A produces an ECAM message "FADEC CHANNEL A (or B) FAULT", Fault Level B produces an ECAM message "FADEC MINOR FAULT", and Fault Level C produces no ECAM message. The operational dispatch criteria are defined in the applicable Master Minimum Equipment List (MMEL). The time limitations are defined in the applicable Aircraft Maintenance Manual (AMM) and Troubleshooting Manual (TSM).

R ENGINE − TIME LIMITED DISPATCH CRITERIA − TIME LIMITS

R Task 05−10−03−990−002:

R 1. Time Limited Dispatch Criteria

R NOTE: Step A. is "NOTE 19" as excerpted from the "PW4000 TYPE
R CERTIFICATE DATA SHEET NUMBER E24NE".

R A.
R The PW4000 series engines have been approved to operate with
R certain faults present in the control system based on
R satisfaction of FAR 33 requirements and appropriate FAR 25
R control system reliability requirements. The following
R criteria exist as dispatch and maintenance requirements for
R the engine control system. This criteria is specified in
R Pratt & Whitney Report PWA 6139 and PWA 6139 Addendum, which
R defines the various configurations and maximum operating
R intervals, as follows. Fault Level A − no dispatch allowed.
R Fault Level B − dispatchable; maximum operating interval
R for Fault Level B fault(s) is 20 days. Fault Level C −
R dispatchable; maximum operating interval for Fault Level
R C fault(s) is 1000 operating hours. Review of EEC fault
R data from only the most recent flight leg is sufficient at
R the 1000 hour interval except for the following EEC part
R numbers, P&W PN 50D791, PN 50D824, PN 51D037, PN 50D823, PN
R 51D319 and PN 51D586.
R Faults Levels A, B, and C constitute Pratt & Whitney
R nomenclature. The airframe manufacturers may use different
R nomenclature in adapting these fault categories to the
R aircraft maintenance and display systems, however, the
R maximum operating intervals are restricted as shown above.
R A control system reliability monitoring program has been
R established with Pratt & Whitney in compliance with the
R reporting requirements as outlined in the Engine and
R Propeller Directorate Policy letter, dated October 28, 1993,
R for Time Limited Dispatch of Engines fitted with FADEC
R Systems.

R B. In Airbus installations Fault Level A produces an ECAM
R message "FADEC CHANNEL A (or B) FAULT", Fault Level B
R produces an ECAM message "FADEC MINOR FAULT", and Fault
R Level C produces no ECAM message. The operational dispatch
R criteria are defined in the applicable Master Minimum
R Equipment List (MMEL). The time limitations are defined
R in the applicable Aircraft Maintenance Manual (AMM) and
R Troubleshooting Manual (TSM).

ENGINE - MAINTENANCE ADVISORY NOTICES (MAN) - TIME LIMITS

Task 05-10-04-990-001:

1. Maintenance Advisory Notices

A. General

(1) The Maintenance Advisory Notice (MAN) is an advisory (not a mandatory directive) to provide increased visibility to the airlines for repetitive maintenance actions which include inspections, engine and component build standards, ETOPS requirements, etc. In addition, MANs share the characteristics which follow:

(a) A distinguishable document for each engine model that has its own identification and issue-sequence code for traceability.

(b) A notification that provides recommended maintenance action of a repetitive nature, an implementation procedure and cites the necessary material resources.

(c) An advisory guide that can be utilized as action for P & W supplier and nacelle components as well as the basic engine.

(2) The tabular format is provided as a cross-reference index to associate the Maintenance Advisory Notice with the subject matter and the related Engine Manual ATA Code. See the listed documents to establish a specific application.

ATA Codes	Description	MAN Document	Hours	Cycles	Comments
None					

ENGINE − MAINTENANCE ADVISORY NOTICES (MAN) − TIME LIMITS

Task 05−10−04−990−002:

POWER PLANT GENERAL - INSTALLATION-00

Task 71-00-00-990-001:

1. General

A. The procedures in this publication are for an "On-Condition Maintenance Program" and give all the data to do a single maintenance action/task. Each procedure, to remove and install a QEC component, is a complete (stand alone) task. The sequence of all the tasks in this publication is not the sequence to replace all the QEC components on the total engine.

B. If you remove all the QEC components you can use the number sequence on the list that follows to install all the QEC components for a total engine buildup.

C. Each procedure shows the Engine Manual (EM) location and the Power Plant Illustrated Parts Catalog (PPIPC) location. In the PPIPC, at the locations shown, the correct part number configuration for a build-up of a power plant is provided.

NO.	PROCEDURE	EM LOCATION	PPIPC LOCATION

PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

Previous Pageblock Return to Previous Menu Next Pageblock

POWER PLANT GENERAL − FAULT ISOLATION−00

Task 71−00−00−810−001:

1. Engine Fault Isolation Procedures

A. Fault Isolation Procedures

(1) Refer to the Airbus A300−600 and A310 Troubleshooting Manuals for Fault Isolation Procedures.

NOTE: Airbus A300−600 and A310 Troubleshooting Manuals may be obtained from:

Airbus Industrie
Product Support Directorate
Technical Publications
1, rond−point Maurice Bellonte
31707 Blagnac Cedex
France

B. Procedure

(1) Adapt the EEC FAULT MESSAGES to the Airbus A300−600 and A310 Troubleshooting Manual (TSM) as follows:

(a) The EEC transmits FAULT MESSAGES in a "LABEL − HEXIDECIMAL BIT" format.

(b) The Airbus A300−600 and A310 aircraft "Electronic Centralized Aircraft Monitoring" (ECAM) system displays the engine status and faults as "LABEL − HEXIDECIMAL BIT CODE" These codes must be manually converted to LABEL−BIT messages.

(c) The Troubleshooting Manual (TSM) has the conversion procedure and identifies each of the LABEL−BIT MESSAGES. The Troubleshooting Manual (TSM) also lists the corrective action that is necessary to clear the faults.

(2) Adapt the EEC FAULT MESSAGES for the test cell as follows:

(a) The instructions in the Troubleshooting Manual (TSM) are for an engine installed on the aircraft. These instructions must be adapted to the engine configuration and equipment that is used in the test cell.

(b) Some EEC FAULT MESSAGES transmitted in the test cell indicate corrective action that is necessary for hardware that is not normally installed on an engine in a test cell. For this category of FAULT MESSAGE, you must see the specific test cell operating procedures, not the Troubleshooting Manual (TSM).

(c) LABEL−BIT FAULT MESSAGES that have a high probability of being caused by test cell wiring or equipment are shown in the list that follows:

LABEL−BIT	FAULT
350−23	EXTERNAL DISCRETES DISAGREE
350−24	PROBE HEAT OFF
350−27	ADC 1 (LEFT) FAULT
350−28	ADC 2 (RIGHT) FAULT
350−29	SERIAL DIGITAL DATA (THRUST CONTROL COMPUTER) FAILURE
352−25	REVERSER RANGE/RATE
352−26	TRA RANGE/RATE
352−27	TRA OUT OF RANGE HIGH
354−19	28VDC SOLENOID POWER OUT

POWER PLANT GENERAL - STORAGE/TRANSPORT-00

Task 71-00-00-510-001:

1. Transporting Power Plant By Truck

CAUTION: ALL PW4000 SERIES POWER PLANTS BEING TRANSPORTED BY TRUCK, REQUIRE THAT BOTH TRACTOR AND TRAILER BE EQUIPPED WITH AN AIR SUSPENSION SYSTEM REGARDLESS OF DISTANCE TO BE TRANSPORTED. IT IS STRONGLY RECOMMENDED THAT ALL ENGINE TRANSPORT STANDS BE PURCHASED PER 70-80, STANDARD PRACTICES MANUAL.

A. Transport Power Plant By Truck And Trailer, Equipped With An Air Suspension System, After Power Plant Has Been Properly Packaged

POWER PLANT GENERAL - STORAGE/TRANSPORT-01

Task 71-00-00-510-002:

1. Introduction And General Data - Split-Shipment

A. This section gives instructions for assembly and disassembly of split-shipped power plants at a remote-site.

NOTE: A split-shipment power plant is a complete EBU engine prepared for aircraft installation, but does not include:
- The exhaust nozzle and plug
- The inlet cowl
- The components that attach to the inlet cowl.

B. These instructions for remote on-site work, can be used for disassembly and pre-shipment of serviceable replacement power plants. Use Storage/Transport-02 for preparation of replacement power plant or out-of-service power plant split shipment.

C. Necessary documents for the assembly of some equipment and for the removal/installation of the power plant to the aircraft are referred to in the procedures.

D. Procedure Format

(1) The split-shipment section is put in sequence as follows:

(a) Storage/Transport-01 (Introduction And General Data).

(b) Storage/Transport-02 (Preparation Of Power Plant For Split-Shipment).

(c) Storage/Transport-03 (Assembly Of Serviceable Power Plant At Remote Site After Split-Shipment).

E. Three Pallet System

(1) The serviceable replacement power plant is split-shipped to a remote-site on three pallets.

(2) The first pallet contains:

(a) An erectable gantry system with necessary hoists.

(b) An erectable lightweight trailer.

(c) A tool kit.

(3) The second pallet contains:

(a) The LPC, fan case, and intermediate case as a unit (fan−unit).

(b) The support fixtures for the fan−unit.

(c) A storage compartment.

(4) The third pallet contains:

(a) The HPC,diffuser case, HPT, LPT, and the exhaust case as a unit (core−unit).

(b) The support fixtures for the core−unit.

(c) The transport stand.

F. On−Site General Conditions And Equipment

(1) The on−site general condition must be as follows:

(a) The work area must be level.

(b) The work area must be hard for the total weight of the power plant and gantry system−−approximately 18,000 lbs. (8164.66 kg). The work area must also be hard for the movement of the loaded light−weight trailer or the loaded transport stand.

(c) The work area must have a horizontal clearance of 41 ft (12.5 m) minimum. The work area must also have a vertical height of 20 ft (6.10 m) minimum.

(d) The work area must be as near as possible to the out−of−service aircraft. An indoor area is preferred.

(2) The equipment that follows must be available at the work site:

(a) A 16,500 lb (7484.27 kg) lift capacity fork−lift truck with 6 ft (1.83 m) minimum adjustable tines.

(b) A 20 ft (6.10 m) long stepladder.

(c) A 9 ft (2.74 m) long stepladder.

(d) A one ton (907 kg) capacity lift strap.

(3) Table 1201 gives the minimum standard tools recommended at the remote−site. These tools are not supplied with the split−shipment system, but must be with the work−crew at the remote−site.

NOTE: This list can be changed by the work−crews that do the split−ship procedure.

Table 1201 (Continued)

G. General Data

CAUTION: INSTALL THE PROTECTIVE CAPS OVER THE TUBE ENDS. DO NOT INSTALL THE PROTECTIVE CAPS IN THE TUBE ENDS. ACCIDENTAL ASSEMBLY OF TUBES WITH THE PROTECTIVE CAPS INSTALLED IN THE ENDS, CAN RESULT IN FLOW BLOCKAGE AND ENGINE DAMAGE.

(1) The correct plugs and covers must be used to prevent contamination and damage.

(2) Use necessary precautions to prevent lockwire pieces, nuts, bolts, washers, or other unwanted objects from getting into the engine. The assembly procedure must stop if an unwanted object falls into the engine. The object must be found and removed before the assembly procedure is started again.

(3) Be sure all parts are clean and not damaged before installation. All corrosion preventive compound must be cleaned from all parts.

(4) Use lockwire, lockwashers, tablocks, tabwashers, cotter pins, and packings only one time. Use only corrosion resistant lockwire and cotter pins. All lockwire and cotter pins must attach tightly in their holes. Install all cotter pins with the head in the castellation of the nut. Bend half of the pin over the head of the nut. Bend the other half of the cotter pin down against the flat of the nut.

(5) For tubes with brazed ferrules on one end and loose ferrules and nuts on the other end, tighten the tube as follows:

(a) Install the tube to the engine with any packings needed and tighten by hand.

(b) Install any clamps needed for tube position.

(c) Tighten and torque the end with the brazed on ferrule first.

(d) Tighten and torque the end with the loose ferrule and nut second.

(e) Install lockwire.

(6) Dimensions, torques, weights, and measures are given in US units and SI−metric equivalent. The metric equivalent is in paranthesis and follows the US value.

(7) Standard torque values and special torque values are given in the procedures when necessary.

(8) The clock positions, referred to in the procedures, are as seen from the rear of the power plant or assembly.

H. Procedures Referred To

(1) The publications and procedures given below are needed in addition to these split−shipment instructions (71−00−00, Storage/Transport −02,−03).

(a) Airbus A300−600 Aircraft Maintenance Manual.

(b) Advanced Ground Systems Engineering Instructions (provided with the three−pallet system).

Task 71-00-00-530-001:

1. Prepare Power Plant For Split - Shipment

A. Prerequisites

(1) Remove and assemble the PWA 85650 lightweight trailer from the first pallet. See the Advanced Ground Systems Engineering Instructions.

(2) Remove the out-of-service power plant from the aircraft. Use the lightweight trailer from the first pallet. See the Airbus A300-600 Aircraft Maintenance Manual, 71-00-00, Power Plant - Removal/Installation.

(3) Remove the nose cowl. See the Airbus A300-600 Aircraft Maintenance Manual, 71-11-00, Nose Cowl - Removal/ Installation.

(4) Remove the exhaust nozzle. See the Airbus A300-600 Aircraft Maintenance Manual, 78-11-01, Exhaust Nozzle - Removal/Installation.

(5) Remove the exhaust plug cone. See the Airbus A300-600 Aircraft Maintenance Manual, 78-11-02, Exhaust Plug Cone - Removal/Installation.

(6) Remove the forward engine mount. See the Airbus A300-600 Aircraft Maintenance Manual, 71-21-00, Forward Engine Mount - Removal/Installation.

NOTE: You must examine the engine mount bolts before each installation. See the Airbus A300-600 Maintenance Manual, 71-21-00, Engine Mount Bolts Inspection/Check.

B. Equipment And Materials Required

Standard Tools:

.190-32 Jackscrews, Eight Necessary Per Text
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 85609 Split Engine Transport EBU System (The tools that follow are contained in this system).

.PWA 85610	Change L Tool Kit
..PWA 29389	Hydraulic Pump
..PWA 29614	Wrench (Coupling Nut)
..PWA 29615	Holder (Coupling Nut)
..PWA 29855−7	Aligning Pin (2 Necessary)
..PWA 75174	Lifting Eye (Rear Mount) (Optional to PWA 86415)
..PWA 85260	Guide Pin (2 Necessary)
..PWA 85299	Adapter (Optional to PWA 102460 Adapter)
..PWA 85300	Wrench (Coupling Nut)
..PWA 85301	Adapter (Coupling Nut)
..PWA 85302	Wrench (Coupling Nut)
..PWA 85306	Puller (Coupling Plug)
..PWA 85307	Puller, Jackscrew
..PWA 85390	Lifting Adapter (Front Core)
..PWA 85429	Wrench (Hand−LPT Nut)
..PWA 85452	Lifting Eye (Turbine Exhaust Case)
..PWA 85513	Sling
..PWA 85585	Guide Ring (1.5 Bearing)
..PWA 85632	Puller, Jackscrew (1.5 Bearing)
..PWA 85659	Lifting Eye (Rear Fan)
..PWA 85749	Torque Adapter
..PWA 85769	Fixture, Install/Remove (Coupling)
..PWA 85785	Adapter, Piloting
..PWA 86191	Torque Adapter
..PWA 86203	Guide, Lifting (LPT Shaft)
..PWA 86225	Wrench (Tool Coupling)
..PWA 86415	Lifting Eye (Rear Mount) (Optional to PWA 87275)
..PWA 87275	Lifting Eye (Rear Mount)
..PWA 101848	Puller, Jackscrew (6 Necessary)
..PWA 102460	Adapter
.PWA 85611	Transport System (Core−Unit)
..PWA 85388	Coupling (LPT Shaft/HPC)
..PWA 85389	Support Ring (Core−Unit Front)
..PWA 85614	Transport Stand (Core−Unit)
..PWA 86325	Fixture (LPT Shaft) (Optional to (PWA 86437) Fixture − See Note)
..PWA 86437	Fixture (LPT Shaft)(Optional to (PWA 86325) Fixture − See Note)
..PWA 88222	Fixture, (LPT Shaft) (Optional to PWA 86437)
.PWA 85612	Transport System (Fan−Unit)
..PWA 85380	Fixture (Fan−Unit Front)
..PWA 85381	Shipping Nut (Fan−Unit Front)

Special Tools:

..PWA 85383	Bracket (Fan-Unit To Pallet)
..PWA 85397	Shield (EEC)
..PWA 85492	Adapter (Fan-Unit Rear To Pallet)
..PWA 85615	Pallet (Fan-Unit)
..PWA 85618	Ring Retainer (No. 1.5 Bearing)
..PWA 86355	Shield (SCU)
.PWA 85613	Lightweight Trailer
.PWA 85633	Gantry Assembly
.PWA 86108	Container - Tool Storage
.PWA 86289	Closures - Engine Split Transport, Fan-Unit
.PWA 86290	Closures - Engine Split Transport, Core-Unit
PWA 101359	Puller, Mechanical (Pre SB PW4ENG 73-88)

NOTE: The (PWA 85609) Split Engine Transport EBU System contains all the tools indented below the System. The (PWA 85610) Tool Kit, the (PWA 85611) Transport System, and the (PWA 85612) Transport System contain all the tools indented two spaces below them.

NOTE: You can use the (PWA 86325) Fixture only on exhaust cases with the 30 bolthole rear cover. You can use the (PWA 86437) or (PWA 88222) Fixture on either the 30 or 16 bolthole rear cover configuration.

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-045	Pen, Marking
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P06-021	Compound, Antigalling (PWA 550-3)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	72-61-00/12/270
Packing	1	79-11-00/2/1

C. Procedure

NOTE: Use this procedure for the preparation of out−of−service power plants or serviceable replacement power plants. If you use this procedure in the shop, you can use the shop rails and hoists instead of the PWA gantry system.

(1) Move the out−of−service or replacement power plant from the PWA 85613 Lightweight Trailer to the PWA 85614 Core−Unit Transport Stand as follows. See Figure 1201.

(a) Remove the oil tank overflow tube, bottom anti−ice duct, and forward anti−ice duct (tee) as follows.

1 Disconnect the oil tank overflow tube nut adjacent to the front hydraulic pump. Remove the clamp bolts that attach the tube to the duct and the gearbox bracket. Remove the tube and install the protection covers.

2 Disconnect the tube nut from the top of the forward duct (tee).

3 Remove the three clamps that attach the bottom duct to the top duct and the forward duct (tee) to the two fan case mounted ducts.

4 Hold the ducts and remove the bolt, washer, and nut that attach the support link to the bottom duct. Remove the bottom and the forward ducts together as a unit. Remove and discard the seals. Install the washer, bolt and nut to the link.

5 Install the protection covers.

(b) Put the power plant and lightweight trailer under the gantry.

(c) Use hoist No. 4 and install the PWA 87275 Lifting Eye or PWA 86415 Lifting Eye or PWA 75174 Lifting Eye to the rear flight mount with the bolts that attach the power plant to the aircraft. Put slight tension on the hoist.

(d) Install the PWA 85659 Lifting Eye, with larger swivel rearwards, to the 12 o'clock position boss on the intermediate case. Attach the adapter with the bolts supplied with the adapter. Attach Hoist No. 3 to the larger swivel. Put light tension on the hoist.

(e) Disconnect and lift the power plant from the lightweight trailer. Remove the trailer. Remove the front trailer supports from the engine and put them with the trailer.

(f) Install the core−unit transport stand front supports to the engine. Put the core−unit transport stand under the power plant. Install and attach the power plant to the stand.

(g) Disconnect the hoists.

(2) Drain fluids as follows. See Figure 1202.

(a) Remove the magnetic (chip detector) plugs and valves from the main gearbox and the oil tank. Allow oil to drain into a container.

(b) Install the new packings, PN AS3208−08, to the plug valves. Install the chip detector valves, threads and packing lubricated with Engine Oil P03−001 to the main gearbox and oil tank. Torque the two valves to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(c) Clean the magnetic plugs with a rag. Be sure the packings are on the plugs. Install the plugs by hand.

(3) Remove the EEC speed transducer (N1) with or without the multiplexer input as follows. See Figure 1203.

CAUTION: BE VERY CAREFUL WHEN YOU REMOVE OR INSTALL A LINER SEGMENT. THE WASHERS THAT ARE ATTACHED TO THE LINER BRACKET CAN BECOME DISCONNECTED. ALSO, IF

THE EDGE OF THE LINER SEGMENT HITS SOMETHING, IT CAN DELAMINATE.

(a) Remove the screws/bolts that attach the liner segment and spacer plate to the fan exit case at 5 and 7 o'clock positions. Carefully remove the liner and spacer plate.

NOTE: Classified washers (0 - 3 as necessary) can be installed between the liner and the intermediate case front center attachment bracket. The washers, if used, are needed for the gap between the liner and the bracket. The washers are attached with adhesive compound to the bracket.

NOTE: To remove acoustical liners, it is necessary to first remove the sealant that is on the liner screws. Remove the sealant mechanically.

(b) If the classified washers are loose from the bracket, install lockwire to temporarily attach the washers.

NOTE: If the power plant is a serviceable replacement, re-attach the classified washers per Engine Manual 72-00-33, Installation-01 Task 72-00-33-420-001.

(c) Disconnect the harness connector(s) from the probe.

(d) For engines with the PMUX, remove the lockwire and disconnect the PT2.5 sensing tube nut from the probe. Remove the tube clamp bolt from the Flange E bracket.

(e) If necessary, bend the key washer(s) down that attach the probe to the case. Loosen and remove the bolts and nut (if equipped) equally. Remove the bolts, nut (if equipped) and washers. Discard the key washers if used.

CAUTION: DO NOT TRY AND TURN THE TRANSDUCER PROBE DURING REMOVAL UNTIL PROBE IS DISENGAGED FROM INNER BRACKET.

(f) (Pre SB PW4ENG 73-88) Use PWA 101359 Puller to break the interface between the flange of the transducer probe and the intermediate case.

(g) (Post SB PW4ENG 73-88) Use three .190-32 jackscrews in the transducer flange jackscrew holes to break the interface between the flange of the transducer probe and the intermediate case.

(h) Move the PT2.5 tube and the bracket (if equipped) away and lower and remove the transducer probe. Remove and discard the three packings. Temporarily attach the shim to the probe with lockwire.

(i) Install the protective covers to all the openings.

(4) Disconnect the W1 wiring harness and airframe wiring harness as follows. See Figure 1204.

NOTE: Keep all removed clamp bolts in the clamps or brackets with the self-locking feature of the clamp nut engaged.

(a) Use the PWA 85749 Torque Adapter and disconnect the W1P11 and the W1P10 connectors from the solenoid at 1 o'clock position. Remove the clamp bolts and nuts that attach the W1 harness to the Flange E bracket and the tube clamp at 1 o'clock position.

(b) Disconnect the airframe harness connector from the override pressure switch adjacent to the 1 o'clock position solenoid.

(c) Disconnect the W1P25 connector from the receptacle on the HPC case bracket at 1 o'clock position.

(d) Disconnect the W1P24 connector from the receptacle on the HPC case bracket at 10 o'clock position.

(e) Disconnect the W1P9 connector from the receptacle on the HPC case bracket at 12 o'clock position.

(f) Remove all the clamp bolts that attach the W1 harness to the HPC case brackets and the Flange E bracket.

(g) Temporarily attach the W1 harness to the 12 o'clock strut clear of the core−unit.

(h) Install protective covers to the harness connectors and receptacles.

(5) Disconnect the W2 wiring harness as follows.

NOTE: Keep all removed clamp bolts in the clamps or brackets with the self−locking feature of the clamp nut engaged.

(a) Disconnect the W2P26 connector from the receptacle on the HPC case bracket at 12 o'clock position.

(b) Remove the bolt that attaches the retaining bracket and the W2J9 harness receptacle from the HPC case bracket at 12 o'clock position.

(c) Remove all the clamp bolts that attach the W2 harness to the No. 1, 1.5, and 2 bearing breather tubes and to the Flange E bracket.

(d) Temporarily attach the W2 harness to the 12 o'clock strut clear of the core unit.

(e) Install protective covers to the harness connectors and receptacles.

(6) Disconnect the harness connectors as follows.

(a) Disconnect the airframe harness connector from the IDG heat−exchanger receptacle at 4 o'clock position. Remove the two bolts that attach the retaining bracket and IDG harness receptacle to the HPC case bracket. Remove the receptacle. Install again the retaining bracket and bolts. Tighten the bolts to engage the locking feature of the bracket nuts. Remove the two clamp bolts that attach the IDG harness to the hydraulic tube. Install protective covers.

(b) Use the PWA 85749 Torque Adapter and disconnect the W4P4 and the W5P11 connectors from the solenoid at 5 o'clock position. Install protective covers.

(c) Remove the clamp bolt that attaches the W4 harness (to the EEC speed transducer) to the bleed valve supply tube at 5 o'clock position.

(d) Disconnect the W3P15 connector from the 2.5 bleed valve actuator at 7 o'clock position. Install protective covers.

(e) Disconnect the W3P17 connector from the (engine) air/oil heat exchanger harness receptacle at 7:30 o'clock position. Remove the two bolts that attach the retaining bracket and receptacle to the HPC case bracket. Remove the receptacle from the bracket. Install again the retaining bracket and two bolts to the bracket. Tighten the bolts to engage the locking feature of the bracket nuts. Install protective covers.

(f) Use the PWA 85749 Torque Adapter and disconnect the W3P12 connector from the solenoid at 10 o'clock position.

(g) Disconnect the four large IDG cable clamps from the engine brackets at approximately 9 o'clock position. Move the cables rearward.

(7) Remove the lockwire and disconnect the EEC PB sensing tube (AS19) at 12:30 o'clock position. See Figure 1205.

(8) For engines with PMUX or SCU, remove lockwire and disconnect the PT2.5 sensing tube (AS30) at 12:30 o'clock position. See Figure 1205 (Sheet 1).

(9) Remove lockwire and disconnect the HPC air valve supply tube (AA25) and signal tube (AA01) from the solenoid adapters at 1 o'clock position. See Figure 1205 (Sheet 1).

(10) Remove lockwire and disconnect the two No. 3 bearing air cooler tubes (AP33) and (AP34) from the cooler at 2:30 o'clock position.

(11) Disconnect and remove the tubes from the IDG heat exchanger at 4 o'clock position as follows. See Figure 1205 (Sheet 2).

(a) Remove the lockwire and disconnect the airframe (IDG) cooler outlet oil tube (LS03) nut. Remove the three bolts that attach the tube to the heat exchanger. Remove the tube and discard the packing. Install the protective covers to the tube ends and port with the three bolts. Remove lockwire and disconnect the lower tube (LS06) nut near the fuel metering unit. Remove the clamp bolt that attaches the tube (LS06) to the lever bracket.

NOTE: The lower tube (LS06) is disconnected and the clamp bolt removed for clearance required when the core−unit is put into the lower shipping position.

(b) Remove the three bolts and washers and disconnect the (upper) airframe (IDG) cooler inlet oil tube. Disconnect the (lower) airframe (IDG) cooler inlet oil tube from the (left) tube at approximately 6 o'clock position. Remove the clamp, bolts, nuts, and washers. Remove the upper and lower tube as a unit. Install the protective covers.

(c) Remove the hydraulic drain tube and cross tee from the heat exchanger. Install the protective covers to the tubes, cross tee, and adapter.

(d) Remove the lockwire and remove the (IDG) air/oil cooler valve hydraulic pressure tube (CP13) and return tube (CR12) from the heat exchanger and the manifolds. Install the protective covers to the tubes, manifold tees, and the adapters.

(12) Remove the lockwire and disconnect the compressor stator cylinder hydraulic pressure tube (CP12) and return tube (CR03) from the manifolds and cylinder as follows. See Figure 1205 (Sheet 3).

(a) Remove the clamp bolts that attach the tubes to the Flange E bracket.

(b) Remove the tubes and install the protective covers to the tubes, manifold tees, and adapters.

(13) Remove the hydraulic pressure manifold (CP05) and oil cooler inlet return manifold (CR01) as follows.

(a) Remove the lockwire and disconnect the two hose nuts from the manifolds at 3 o'clock position.

(b) Remove the lockwire and disconnect the two manifolds at the lower tee connections at 5 o'clock position.

(c) Remove the clamp bolts and nut that attach the manifolds to the engine brackets. Remove the manifolds and install the protective covers to the hoses and to the manifold ends.

(14) Remove the fuel distribution valve supply tube (FM09)
R as follows. See Figure 1205 (Sheet 4) or (Sheet 5) as
R applicable.

(a) Remove the lockwire and disconnect each end.

(b) Remove the clamp bolts and nuts that attach the tube to the engine.

(c) Remove the tube and discard the packings and retainers.

(d) Install the protection covers.

(15) Remove the three bleed valve supply tubes (AA26),
R (AA27), and (AA29) as follows. See Figure 1205 (Sheet
R 6) and Figure 1205 (Sheet 7).

(a) Remove the lockwire and disconnect the three tube connections at 2:30 o'clock position.

(b) Remove the lockwire and disconnect the two tube connections to the 5 o'clock position solenoid. Remove the lockwire and disconnect the tube connection at the maintenance break adjacent to the solenoid. Remove the lockwire and disconnect the tube nut from the tee adjacent to the solenoid.

(c) Remove the clamp bolts that attach the tubes to the engine brackets, to each other, and to the harness clamps.

(d) Remove the tubes from the engine. Install the protective covers to all the tube ends and the solenoid adapters.

(16) For engines with 2.5 sensing remove the PT2.5 sensing
R tube (AS30) and manifold (AS31) as follows. See Figure
R 1205 (Sheet 8).

(a) Remove the lockwire and disconnect the upper tube from the lower manifold.

(b) Remove the clamp bolts that attach the tube and manifold to the engine brackets.

(c) Remove the tube and manifold. Install the protective covers.

(17) Remove the lockwire and disconnect the angle gearbox oil pressure tube (LP09) from the angle gearbox at 6
R o'clock position. See Figure 1205 (Sheet 9).

(18) Remove the two bolts that attach the angle gearbox oil scavenge tube (LR01) to the angle gearbox at 6 o'clock position. Loosen the clamp bolts as necessary to disengage the tube from the angle gearbox boss. Remove the packing. Install protective covers.

(19) Remove lockwire and disconnect the (2.5) bleed valve cylinder hydraulic pressure (CP06), return (CR02), and drain tubes from the cylinder and manifolds. See Figure 1205 (Sheet 9). Remove the pressure and return tubes. Remove the drain tube clamp bolt attached to the angle gearbox bracket. Remove the drain tube. Install protective covers to the tubes, adapters, and manifold tees.

(20) Remove the lockwire and disconnect the No. 1, 1.5 and 2 bearing oil scavenge tube (LR03) at 7:30 o'clock
R position. See Figure 1205 (Sheet 11).

(21) Remove the six bolts that attach the air/oil cooler inlet oil tube (LP02) to the main oil filter housing
R and the air/oil heat exchanger. See Figure 1205
R (Sheet 12). Remove the clamp bolt that attaches the
R tube to the HPC case bracket. Move the tube rearward and temporarily attach with lockwire. Discard the packings. Install the protection cover to the filter housing with the bolts.

R CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH
R CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND
R INSTALL A TUBE WITH A FLEX SEGMENT WITH THE
R SAME PRECAUTION USED FOR A TUBE WITHOUT A
R FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A
R TUBE TO HELP WITH THE INSTALLATION OR REMOVAL
R OF THE TUBE OR AN ATTACHED COMPONENT. IF A
R FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE
R A KINK IN THE EXTERNAL WIRE BRAID AND IN THE
R INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND
R LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(22) Remove the two bolts that attach the air/oil cooler outlet hose and tube assembly (LP03) to the air/oil heat exchanger. Remove the lockwire and disconnect the tube nut from the fuel oil cooler bypass valve adapter. Remove the clamp bolts that attach the tube to the engine. Remove the tube and discard the packings. Install the protection covers with the bolts.

(23) Remove lockwire and disconnect each end of the (left) air/oil cooler hydraulic pressure (CP07), return (CR05), and drain tubes from the air/oil heat exchanger adapters at 8 o'clock position and manifolds. Remove the clamp bolt that attaches the pressure tube to the Flange E bracket. Remove the tubes and install the protective closures.

(24) Remove lockwire and disconnect the main bearing oil pressure tube (LP05) from the strainer housing at 9 o'clock position and the strainer housing at top of the
R fuel/oil cooler. See Figure 1205 (Sheet 13). Remove
the clamp bolts and remove the tube. Discard the packing and retainer. Remove the bolt and clamp that attach the strainer housing to the Flange E bracket. Install protective covers.

(25) Remove lockwire and disconnect the two signal tubes (AA06) and (AA18) and the supply tube (AA22) from the solenoid adapters at 10 o'clock position.

(26) Remove the hose clamp and disconnect the cooling air hose from the cooling air supply tube (AC35) at 10:30 o'clock position.

(27) Remove lockwire and disconnect the main bearing breather tube (LB06) at 11:30 and 9 o'clock positions.
R See Figure 1205 (Sheet 14). Remove the clamp bolts and
remove the tube. Install protective covers.

(28) Remove lockwire and disconnect the EEC PT4.95 tube (AS04) at 11:30 o'clock position. Remove the bolt and clamp that attach the tube to the Flange E bracket. See Figure 1205 (Sheet 14). R

(29) Remove the compressor inlet cone as follows. See Figure 1206.

(a) Use a Marking Pen P05−045, or an equivalent, and make a disassembly vector (DV) mark from the inlet cone front segment to the rear segment. Remove the six bolts and washers that attach the front segment. Remove the inlet cone front segment.

(b) Use a Marking Pen P05−045, or an equivalent, and make a disassembly vector (DV) mark from the inlet cone rear segment to the front hub and plug. Make the mark in line with the previous mark. Remove the 19 bolts and washers that attach the inlet cone rear segment to the front hub. Remove the inlet cone rear segment.

(30) Remove the turbine shaft (coupling/retaining) nut as follows. See Figure 1207.

(a) Remove the retaining ring and key washer from the front hub plug. Use the PWA 85306 Puller and remove the plug and packing. Discard the packing.

(b) Install the PWA 85301 Adapter into the coupling nut and engage the teeth. Slide the three clamps outward and tighten the wingnuts to attach the tool.

(c) Install the PWA 85302 Wrench over the adapter and engage the teeth. Slide the three clamps outward and tighten the wingnuts to attach the tool.

(d) Install the PWA 29614 Mechanical Wrench with the PWA 86191 Torque Adapter and the PWA 29615 Holder. Loosen the turbine shaft (coupling/retaining) nut.

(e) Remove the wrenches and holder. Remove the nut by hand.

NOTE: The turbine shaft (coupling/retaining) nut must have the antigallant replaced per Engine Manual 72−32−80, Repair−01 (Task 72−32−80−300−001) before each installation.

(31) Remove the turbine shaft nut as follows. See Figure 1208.

(a) Remove the retaining ring and key washer from the nut and coupling.

(b) Install the PWA 102460 Adapter or PWA 85299 Adapter into the coupling and engage the teeth. Slide the three wingnuts outward and tighten to attach the tool.

(c) Install the PWA 85300 Wrench to the center of the adapter and engage the teeth to the nut.

(d) Install the PWA 29614 Mechanical Wrench with the PWA 86191 Torque Adapter installed and loosen the turbine shaft nut.

(e) Remove the wrenches and adapter. Use the PWA 85429 Wrench to remove the nut by hand. Remove the washer.

NOTE: The turbine shaft nut must have antigallant replaced per Engine Manual 72-32-84, Repair-01 Task 72-32-84-300-001 before each installation.

(32) (Post SB PW4ENG 79-76) Remove No. 4 bearing (oil) pressure tube. See Figure 1209 (Sheet 1).

NOTE: It is not necessary to remove the (Pre SB PW4ENG 79-76) No. 4 bearing (oil) pressure tube.

(a) Remove the No. 4 pressure tube (1209/10) from the turbine exhaust case at the 4:30 o'clock position.

1 Remove two bolts (1209/1) that attach the tube shield (1209/16) and bracket (1209/2) to the turbine exhaust case.

2 Remove the tube shield (1209/16), bracket (1209/2), thrust wire (1209/18) and nut (1209/17) from the outboard end of the pressure tube.

3 Remove the bolt (1209/6) and nut (1209/12) that attach the tube clamp (1209/7) and tube to the bracket (1209/8).

4 Cut the restraining straps (1209/3) and remove the insulation slide clamp (1209/13) and shield sets (1209/9) and (1209/4) from the tube.

5 Remove the tube nut from the adapter (1209/14) and move the tube radially inward and remove the pressure tube from the case.

(b) Install a protective cover on the adapter (1209/14).

(c) Secure bolts (1209/5) and bracket (1209/8) on the turbine exhaust case.

(33) Remove the No. 4 bearing cover as follows. See Figure 1209 (Sheet 2).

(a) Remove the 30 bolts or the 16 bolts that attach the No. 4 bearing shield and the No. 4 bearing heat shield to the exhaust case. Remove the shields.

(b) For No. 4 bearing cover that has six small threaded holes (Pre SB PW4ENG 72-385), install the PWA 85307 Jackscrew Puller to the rear inner bolt hole flange (Flange T1) of the exhaust case and attach with two bolts, washers and nut details. Install the small plate of the puller to the six threaded holes in the cover and attach with six knurled screw details. Turn the jackscrew to disengage the cover from the exhaust case. Remove the puller and the cover from the exhaust case. Remove the cover from the puller. Discard the packing.

(c) For a cover that has eight jackscrew holes (Post SB PW4ENG 72-385), install and evenly tighten eight 0.190-32 Jackscrews to remove the cover. Discard the packing.

(34) (Pre SB PW4ENG 72-472) Remove the No. 4 bearing (oil) nozzle and No. 4 bearing packing transfer tube from boss in the exhaust case (No. 4 bearing compartment) at 1:30 o'clock position. See Figure 1210.

(a) Remove bolts (1210/8) and key washers (1210/6) and (1210/7) securing No. 4 bearing packing transfer tube (1210/5) to No. 4 bearing nozzle (1210/4). Remove tube.

(b) Remove bolts (1210/1) and key washers (1210/2) and (1210/3) securing No. 4 bearing nozzle (1210/4) to exhaust case. Remove nozzle.

(35) (Post SB PW4ENG 72-472) Remove the No. 4 bearing (oil) nozzle and front No. 4 bearing nozzle. See Figure 1211.

(a) Remove the bolts and key washer (1211/1) that attach the front No. 4 bearing nozzle to the No. 4 bearing support flange at the 12 o'clock position. Discard the key washer.

(b) Move the packing transfer tube (1211/15) into the elbow of the No. 4 bearing damper supply tube (1211/12). Remove the nozzle.

(c) Remove the packing transfer tube from the damper supply tube. Discard the two packings (1211/14).

(d) Remove the bolts and key washers (1211/16) and (1211/17) that attach the No. 4 bearing damper supply tube (1211/12) to the No. 4 bearing oil nozzle (1211/11). Remove the tube.

(e) Remove the bolts and key washers (1211/16) and (1211/17) that attach the No. 4 bearing nozzle (1211/11) to the exhaust case. Remove the nozzle.

(36) Remove the No. 4 bearing oil scavenge (inner) tube. See Figure 1212.

(a) Remove bolts (1212/5 and 1212/6) and key washers (1212/4 and 1212/7). Remove oil scavenge (inner) tube (1212/8) from the turbine exhaust case.

(b) Remove and discard gasket (1212/3).

(c) Cover hole in tube attachment pad on the case with a protective cover.

(37) Remove the eight bolts (1213/1) that attach the No. 4 bearing retaining plate to the front compressor drive shaft (1213/2). See Figure 1213.

(38) Install the PWA 86437 Fixture or PWA 86325 Fixture to hold the low pressure turbine (LPT) in position as follows. See Figure 1214.

NOTE: Use PWA 86325 Fixture with turbine exhaust cases that are (Pre SB PW4ENG 72-456). Use PWA 86437 Fixture with either (Pre or Post SB PW4ENG 72-456) turbine exhaust cases.

(a) Install the inner slide to the ID of the No. 4 bearing retaining plate and attach with eight detail screws.

(b) Install the outer slide over the inner slide, put the slot in the outer slide over the key on the inner slide.

(c) Turn the turbine shaft until the scallops in the flange of the outer slide assembly align with the oil pressure and scavenge tubes protruding from the exhaust case flange. Attach the outer slide to the exhaust case with eight detail bolts.

(d) Tighten the eight cap screws.

(39) Install PWA 88222 Fixture or PWA 86437 Fixture to attach the low pressure turbine shaft to the turbine exhaust case. See Figure 1214.

NOTE: Use PWA 88222 Fixture with (Pre or Post SB PW4ENG 72-456) turbine exhaust cases.

(a) Loosen the locknuts that hold the tube and guide assemblies together and install the fixture to the ID of the turbine exhaust case. The tube assembly detail will mate against the No. 4 bearing retaining plate and the guide assembly detail will mate against the rear inner flange of the exhaust case. Attach the fixture with the captured capscrews of both details.

NOTE: If necessary, turn the LPT rotor to align the holes in the end of the 7th stage disk or LPT shaft, as applicable, with the captured capscrews of the tube assembly detail.

(b) Tighten the capscrews of both details to lock the fixture in position.

(40) Use a Marking Pen P05−045, or an equivalent, and make a disassembly vector (DV) mark from the front hub, to the coupling, and to the LPT shaft. Align the mark with the previous mark.

(41) Remove the coupling assembly as follows. See Figure 1215.

(a) Install the PWA 85769 Coupling Fixture as follows.

1 Install the shaft (detail−35) to the end of the LPT shaft and tighten by hand.

2 Install the body assembly (details−8, 19 and 21) with the adapter (detail−3), arm (detail 1) and eye (detail−2) to the coupling.

3 Retract the locating pin. Turn the plate (detail−21) to position the plate lugs behind the coupling lugs. Release the locating pin to lock the tool to the coupling. If installed Remove the eye (detail−2), arm (detail 1), and adapter (detail−3).

4 Install locator (detail−27) to the hub and tighten by hand. Install backup nut (detail−15), handle end first, and tighten so that is below the forward surface of the locator (detail−27). Install the cover (detail−7) with the six bolts (detail−41). Tighten the bolts. Install two rods (detail−10) to the body assembly. Install the two hydraulic cylinders (detail−12) to the rods and attach with the nuts (detail−11). Tighten the nuts by hand. Turn the backup nut (detail−15) out to contact the cover (detail−7). Install a nut (detail−11) to the center rod and tighten by hand.

(b) Connect the hydraulic hoses to the cylinders and to the PWA 29389 Pump. Operate the pump only enough to disengage the tight fit.

(c) Remove the hoses, nuts (detail−11), cylinders (detail−12), cover (detail−7), and backup nut (detail−15).

(d) Attach the adapter (detail−3) with four bolts (detail−4). Use a hoist and install the arm (detail−1) and eye (detail−2). Remove the coupling from the engine and put aside. Protect the bearing and seal plate.

(e) Remove the arm from the fixture and install the eye for later use.

(f) Remove shaft (detail−35) from the engine.

(42) Remove the 16 bolts, washers, and the bracket that attach the No. 1.5 bearing outer race. Use the PWA 85632 Puller and remove the bearing outer race. See Figure 1216.

(43) Install the PWA 85585 Guide Ring to the support with the detail bolts.

(44) Install the PWA 85388 Coupling (LPT to HPC) as follows. See Figure 1217 (Sheet 1).

(a) Install and tighten by hand the PWA 86203 Guide to the LPT shaft. Use this guide to support the LPT shaft during the installation of the PWA 85388 Coupling.

(b) Use the PWA 86225 Wrench and install the PWA 85388 Coupling to the No. 2 bearing support.

NOTE: If equipped, the four grooves on the PWA 85388 Coupling must be fully rearward of the PWA 85585 Guide Ring front surface. If the grooves are not fully rearward of the ring, the coupling threads is not fully engaged.

(c) Use the same wrench and install and tighten the tool detail nut to the LPT shaft until it touches the LPT shaft spacer.

(45) Install the PWA 85380 Fixture to the front of the engine as follows. See Figure 1217 (Sheet 2).

WARNING: BE SURE THAT CENTER RING IS TIGHT IN THE FIXTURE TO PREVENT AN ACCIDENT. TIGHTEN THE EIGHT POSITION BOLTS IF NECESSARY.

(a) Attach Hoist No. 1 to the PWA 85513 Sling. Attach Hoist No. 2 to the eye of the fixture. Use Hoists No. 1 and 2 and PWA 85513 Sling to lift and turn the fixture. Align the fixture to Flange A and install 60 bolts, nuts, and washers. Tighten the nuts by hand.

(b) At the center, loosen the eight position retaining bolts slightly to allow the center ring to move. Align boltholes with the hub nuts and install the detail−19 bolts. Tighten the 19 bolts.

(c) Tighten the 60 Flange A tool bolts.

(d) Tighten the eight position retaining bolts and use the jamnuts to hold their position. Disconnect Hoist No. 2. Put slight tension on Hoist No. 1.

(46) Disconnect the gearbox driveshaft as follows. See Figure 1218.

(a) Remove the six bolts, nuts, and washers that attach the gearbox driveshaft housing to the angle gearbox. Remove the four bolts that attach the two brackets to the HPC case.

(b) Move the driveshaft housing rearward into the main gearbox. Disengage the driveshaft retaining ring and move the driveshaft rearward into the main gearbox.

(47) Install the PWA 85390 Lifting Adapter to the HPC case 8th stage duct openings as follows. See Figure 1219 and Figure 1220.

(a) Remove the eight bolts that attach the right 8th stage duct elbow to the HPC case.

(b) Remove the coupling that attaches the right 8th stage duct elbow to the right 8th stage check valve.

(c) Remove the right duct elbow and the seals. Install the protection covers.

NOTE: Do not disassemble the harness from the bracket.

(d) Disconnect the tube from the mid−stage duct on the left side of the engine.

(e) Remove the nut, bolt, and washer that attach the link to the mid−stage duct. Install the nut, bolt, and washer (without the duct engaged) to the link. Engage the self−locking feature of the nut.

(f) Remove the three couplings that attach the midstage duct to the check valve, the high pressure bleed valve, and the pressure regulating valve. Remove the mid−stage duct. Discard the seals.

(g) Remove the eight bolts that attach the left 8th stage duct to the HPC case. Remove the duct and check valve as a unit. Discard the gasket. Install protection covers.

NOTE: Do not disassemble the harness from the bracket.

(h) If equipped, remove the two bolts and the cover from the forward side of the right side 2.9 bleed valve.

(i) Use Hoist No. 4 and install the PWA 85390 Lifting Adapter to the HPC 8th stage openings. Use the 16 bolts supplied with the adapter. Tighten the bolts. Put only slight tension on the hoist.

(48) Be sure that the hoists are put in position as shown in Figure 1219 (Sheet 3).

CAUTION: BE SURE THAT YOU CONNECT HOIST NO. 3 TO THE REAR EYE (LARGER EYE) OF THE FAN−UNIT REAR LIFTING EYE.

(49) Put tension on Hoist No. 3 to remove the transport stand front supports from the intermediate case. Remove the supports from the stand.

CAUTION: BE SURE THAT HOISTS NO. 1, 3 AND 4 HAVE THE CORRECT EQUAL TENSION TO PERMIT THE SEPARATION OF THE FAN−UNIT FROM THE CORE−UNIT. DO NOT LET THE WEIGHT OF THE FAN−UNIT REST ON THE TOOL COUPLING OR THE GUIDE INSTALLED TO THE FRONT OF THE HPC SHAFT. TOO MUCH OR TOO LESS TENSION ON ANY OF THE HOISTS CAN CAUSE DAMAGE TO THE ENGINE.

(50) Remove 33 bolts from the rear flange of the No. 1.5 bearing support.

CAUTION: FOR RETAINING BOLTS USE WORKBOLTS WITH DRILLED HEADS WITH A 0.500 INCH (12.700 mm) MAXIMUM SHANK AND THREAD LENGTH. (PN MS9218−05 OR PN MS9218−06 IS RECOMMENDED).

(51) Install four retaining bolts in the holes indicated in Figure 1215 (Sheet 1). Tighten by hand. Tag the bolts "To Be Removed."

(52) Install four jacking bolts in the rear flange of the No. 1.5 bearing support assembly. Tighten by hand. See Figure 1220 (Sheet 1). Tag the bolts "Jacking Bolt".

(53) Remove the Flange E bolts that attach the core−unit to the fan−unit. Install two PWA 85260 Guide Pins at approximately 3 and 9 o'clock positions on Flange E. Install two PWA 29855−7 Aligning Pins at approximately 6 and 12 o'clock positions on Flange E.

NOTE: Flange E has two configurations, the UPS configuration has 72 bolts and the other configuration has 74 bolts.

(a) For engines with the 2.5 bleed actuator support bracket (Post SB PW4ENG 75−84) do the following.

1 Remove the three bolts and nuts that attach the support bracket to a bracket on Flange E.

CAUTION: USE A FLASHLIGHT AND BE SURE THAT ALL THE 33 SUPPORT BOLTS AND ALL THE FLANGE E BOLTS ARE REMOVED. COUNT THE BOLTS. THERE SHOULD BE 72 BOLTS FOR THE UPS CONFIGURATION AND 74 BOLTS FOR THE OTHER CONFIGURATION. BE SURE THAT ALL EXTERNAL PARTS ARE DISCONNECTED AND ARE CLEAR FOR SEPARATION.

(54) Install six PWA 101848 Jackscrew Plates as follows. See Figure 1221.

(a) Remove the two detail screws from each plate.

(b) Put each plate between the intermediate case and the HPC case synchronizing ring bosses. Align the screw holes in each plate with the inserts in the intermediate case.

(c) Install two screws to each plate and tighten by hand.

(d) The plates must be installed equally around Flange E.

(55) Install the PWA 85785 Adapter as follows. See Figure 1217.

(a) Install the PWA 85785 Adapter over the previously installed guide until seated.

(b) Turn the legs outward and engage the rear of the fan hub.

(c) Tighten the detail wing nuts to hold the legs in position.

(56) Separate the fan−unit away from the core−unit as follows.

CAUTION: BE SURE THAT HOISTS NO. 1, 3 AND 4 HAVE THE CORRECT EQUAL TENSION TO PERMIT THE SEPARATION OF THE FAN−UNIT FROM THE CORE−UNIT. TOO MUCH OR TOO LESS TENSION ON ANY OF THE HOISTS CAN CAUSE DAMAGE TO THE ENGINE.

(a) Tighten the jackscrews in the No. 1.5 bearing support flange and the jackscrews of the Flange E jackscrew plates equally for the separation. Be sure to monitor Flange E for equal separation all around. Adjust hoist tension during separation if necessary. Also monitor the separation of all external parts. Separate the fan unit from the core unit only slightly. Use a flashlight and be certain there is clearance between the core−unit tool coupling and the fan−unit No. 2 bearing seal. Remove the fan−unit from the core−unit completely.

(b) Discard the packing on the No. 2 bearing support and the intermediate case Flange E diameter (if used).

(c) Remove the oil transfer tube and discard the two packings if equipped.

(d) Remove the six PWA 101848 Jackscrew Plates.

(e) Remove the four bolts in the No. 1.5 bearing support flange with the tag "Jacking Bolt".

(f) Remove the two PWA 85260 Guide Pins and the two PWA 29855−7 Aligning Pins from Flange E.

NOTE: Be sure that all the Flange E bolthole threads are serviceable. Repair any damaged threads.

(g) Install the Lockwire P05−289 to the PWA 85388 Coupling and detail nut.

(h) Remove the PWA 86203 Guide from the front of the core−unit.

(i) Use the PWA 85429 Wrench and install the washer and LPT shaft nut. Tighten until the nut touches the washer. Install the Lockwire P05−289 from the PWA 85388 Coupling to the tool detail nut.

(57) Install protective covers to all tube and adapter openings as shown. See Figure 1222.

(58) Attach Hoist No. 2 to the smaller swivel of the fan−unit rear lifting eye. Put tension on Hoist No. 2 and remove Hoist No. 3 from the lifting eye. See Figure 1223.

CAUTION: DO NOT SUPPORT THE FRONT OF THE CORE−UNIT BY THE TOOL COUPLING THAT IS INSTALLED ON THE FRONT OF THE CORE−UNIT. DO NOT PUT ANY FORCE OR STRESS ON THE TOOL COUPLING. TOO MUCH STRESS ON THE TOOL COUPLING CAN CAUSE DAMAGE TO THE NO. 2 BEARING SEAL NUT.

(59) Use Hoist No. 3 and install the PWA 85389 Support Ring to the front of the core−unit as follows.

(a) Align the center bolt circle and dowel pin hole in the ring with the No. 2 bearing support and dowel pin. Install the 33 bolts supplied with the ring. Tighten the bolts.

(b) Install the 48 bolts, nuts, and washers that attach the ring to the HPC case front flange. Tighten the bolts.

(c) Install the inlet cone segments to the support ring. Use the ring clamps and hand−knobs to attach the rear segment. Install the front segment to the rear segment with six bolts and washers. Tighten the bolts.

(60) Remove the 16 bolts that attach the PWA 85390 Lifting Adapter to the HPC case. Use Hoist No. 4 to remove the adapter. Install protective covers to the openings.

WARNING: BEFORE DISCONNECTING THE CORE−UNIT FROM THE GANTRY HOIST, BE SURE THAT FAN−UNIT IS CENTERED UNDER THE GANTRY. DO NOT ALLOW THE FAN−UNIT TO MOVE NEAR THE END OF THE GANTRY RAIL OR PERSONAL INJURY CAN RESULT.

CAUTION: DO NOT SUPPORT THE FRONT OF THE CORE−UNIT BY THE TOOL COUPLING THAT IS INSTALLED ON THE FRONT OF THE CORE−UNIT. DO NOT PUT ANY FORCE OR STRESS ON THE TOOL COUPLING. TOO MUCH STRESS ON THE TOOL COUPLING CAN CAUSE DAMAGE TO THE NO. 2 BEARING SEAL NUT.

(61) Install the transport stand support to the front of the stand with four bolts. Lower the front of the core−unit onto the support. Remove Hoist No. 3 from the support ring and remove the core−unit and transport stand from under the gantry.

(62) Remove the PWA 85785 Adapter from the front fan hub. See Figure 1224.

(63) Remove the PWA 85585 Guide Ring from the No. 1.5 bearing support. Keep the bolts with the ring.

(64) Install the PWA 85618 Ring Retainer to the support with the three bolts supplied with the ring.

(65) Install the PWA 85492 Adapter to the rear of the fan−unit. Align the boltholes and install the 19 bolts, lubricated with Antigalling Compound P06−021, to attach the adapter. Tighten the bolts.

WARNING: BEFORE TURNING THE FAN−UNIT, BE SURE THAT THE FAN−UNIT IS CENTERED UNDER THE GANTRY. DO NOT ALLOW THE HOIST TO MOVE NEAR THE END OF THE GANTRY OR PERSONAL INJURY CAN RESULT.

(66) Use Hoists No. 1 and 2 to lift and turn the fan−unit to rear end down position. Keep the hoists near the center of the gantry rail. See Figure 1225.

(67) Move and align the fan−unit pallet under the fan−unit. Disconnect Hoist No. 2 and remove the (PWA 85659) Lifting Eye. Use Hoist No. 1 to lower the fan−unit to the pallet. Align the three PWA 85383 Brackets with the intermediate case bosses and attach with bolts. Adjust the bracket height at each location with the threaded rod. Tighten the bolts. Torque the threaded rod to 200 lb−in. (22.597 N.m) to pull the fan−unit down to the pallet. Tighten the jamnuts. Remove Hoist No. 1 and the PWA 85513 Sling .

NOTE: Position the fan−unit on the pallet so that the EEC is over the tool box.

(68) Install the coupling assembly to the fan−unit as follows. See Figure 1226.

(a) Lubricate the coupling assembly as shown.

(b) Put the coupling assembly, with the PWA 85769 Fixture installed, under the gantry. Attach two lifting eyes, a strap, and hoist. Install the assembly to the fan−unit. Be sure that the coupling splines are aligned and engaged.

(c) Remove the PWA 85769 Fixture.

R
R

(69) Install the PWA 85381 Shipping Nut to hold the coupling. Tighten the nut by hand.

(70) Loosen the jamnuts and positioning bolts at the center of the fan−unit front fixture to permit a rearward load on the No. 1 bearing. Tighten the positioning bolts and jamnuts again to hold the rotor position. Install the cover with the (detail−12) bolts.

(71) Install the PWA 85397 EEC Shield over the EEC. For engines with the SCU, install the PWA 86355 Shield over the SCU. Wrap the fan−unit.

(72) Remove the fan−unit pallet from under the gantry.

(73) Remove the following parts for core−unit clearance in the lower shipping position as follows. See Figure 1227.

(a) Remove the pylon drain mast from the core−unit as follows. See Figure 1227 (Sheet 1).

1 Disconnect the drain tube from the mast.

2 Remove the bolts, nuts, and washers that attach the mast to the Flange P bracket.

3 Remove the mast and install protection covers.

(b) Remove the (rear) deoiler vent duct as follows. See Figure 1227 (Sheet 2).

1 Disconnect the rear duct from the front duct.

2 Remove the bolt and washer that attach the duct to the bracket.

3 Remove the (rear) duct and install the protection covers.

(c) Remove the gearbox mounted drain manifold assembly and drain tubes from the core−unit as follows. See Figure 1227 (Sheet 3) and Figure 1227 Sheet 4).

1 Disconnect all the drain tubes attached to the drain manifold assembly at the closest connection above the manifold assembly.

2 Remove the three bolts and washers that attach the manifold assembly to the main gearbox.

3 Loosen and remove any clamp bolts as necessary to remove the manifold assembly with the drain tubes attached.

4 Remove the manifold assembly and tubes. Install the protective covers.

(d) Remove the IDGS pad drain tube adapter. Remove and discard the packing. Install the protection covers.

(e) Disconnect the harness connector from the starter shutoff valve. Remove the clamp bolts and nuts that attach the harness to the No. 4 bearing oil scavenge tube. Temporarily attach the harness above the tube. Install the protection covers.

(f) Remove (as a unit) the starter valve and ducts as follows. See Figure 1227 (Sheet 5).

1 Remove the cooling air hose from the top of the valve.

2 Remove the harness clamps that attach to the valve.

3 Loosen and remove the coupling that attaches the lower forward duct to the starter. Loosen and remove the coupling that attaches the lower duct to the intermediate duct.

4 Hold the valve and duct unit and remove the nuts, washers, bolts, and bushings that attach the two support links to the flange brackets.

5 Lower the unit and remove the two seals between the duct.

6 Install the protection covers.

7 Install the bolts, bushings, washers, and nuts back into the support link rod ends.

CAUTION: BE SURE AND MONITOR THE BOTTOM OF THE CORE−UNIT FOR CLEARANCE WITH THE TRANSPORT STAND AS YOU LOWER THE CORE−UNIT.

(74) Move and align the core−unit under the gantry. Install the two front core−unit mounts with eight bolts and eight washers. Tighten the bolts. Install the two front core−unit supports to the transport stand with eight bolts and washers. Tighten the bolts. Attach Hoist No. 3 and 4 to the front and rear lifting eyes. Put tension on hoists. Remove the front center support from the transport stand. Disconnect and remove the two rear supports from the transport stand. Carefully examine the bottom of the core−unit for proper clearance and lower the core−unit to the shipping position. Attach the core−unit to the transport stand. See Figure 1228.

(75) Disconnect Hoist No. 3. Use Hoist No. 4 and PWA 87275 Lifting Eye, PWA 86415 Lifting Eye or PWA 75174 Lifting Eye and remove the engine rear flight mount from the exhaust case. See the Airbus A300−600 Maintenance Manual, 71−22−00, Rear Lower Engine Aft Mount − Removal.

NOTE: The engine mount bolts must be examined before each installation. See the Airbus A300−600 Maintenance Manual, 71−22−00, Engine Aft Mount Bolts − Inspection/Check.

(76) Install protective covers and prepare the pallets for shipment. Lift and lock the wheels.

(77) Disassemble the PWA 85633 Gantry and lightweight trailer. Install the gantry and trailer to the pallet. Install the PWA 86108 Container (toolbox) to the pallet. See Figure 1229.

NOTE: Instructions for the disassembly of the gantry and the lightweight trailer are found inside the toolbox. The instructions are supplied by the manufacturer of the split−shipment equipment.

(78) Put the tools and engine parts in the PWA 86108 Container.

B. Procedure

(1) With the help of a 16,500 lb. (7484.27 kg) minimum capacity fork-truck, disassemble the first pallet. Remove and position the PWA 86108 Container (toolbox) near the work area. Remove and assemble the PWA 85633 Gantry (And Lightweight Trailer) Assembly. See Figure 1201.

NOTE: Instructions for the assembly of the gantry system and the lightweight trailer are found inside the toolbox. The instructions are supplied by the manufacturer of the split-shipment equipment.

(2) Remove the tools and parts from the PWA 86109 Container. Put tools and parts in order.

(3) After the lightweight trailer is assembled, a second work crew can move the trailer to the out−of−service aircraft. Use the trailer for power plant removal. See Storage/Transport−02 for procedures.

(4) Lower and lock the wheels of the core−unit transport stand and the fan−unit transport stand. Remove shipping wrap.

(5) Move and align the core−unit under the gantry. See Figure 1202.

(6) Install the engine rear flight mount to the exhaust case as follows.

CAUTION: BE CAREFUL WITH THE REAR ENGINE MOUNT. PREVENT DAMAGE TO THE COATING ON THE REAR MOUNT.

(a) Use Hoist No. 4 and install the PWA 87275 Lifting Eye or PWA 86415 Lifting Eye or PWA 75174 Lifting Eye to the mount. Attach the eye with the bolts supplied with the mount.

(b) Use the hoist and lift the rear mount into position.

(c) Install the engine rear mount per the Airbus A300−600 Maintenance Manual, 71−22−00, Engine Aft Mount − Removal/Installation.

NOTE: The engine mount bolts must be examined before each installation. See the Airbus A300−600 Maintenance Manual, 71−22−00, Engine Mount Bolts − Inspection/Check.

CAUTION: DO NOT SUPPORT THE FRONT OF THE CORE−UNIT BY THE TOOL COUPLING THAT IS INSTALLED ON THE FRONT OF THE CORE−UNIT. DO NOT PUT ANY FORCE OR STRESS ON THE TOOL COUPLING. TOO MUCH STRESS ON THE TOOL COUPLING CAN CAUSE DAMAGE TO THE NO. 2 BEARING SEAL NUT.

(7) Install Hoist No. 3 to the lifting eye of the PWA 85389 Support Ring attached to the front of the core−unit. Disconnect the four supports from the stand

and raise the core−unit to the upper assembly position. Remove the two front side supports from the (PWA 85389) Support Ring. Remove the eight bolts and the two front side supports from the transport stand. Use four bolts and install the front center support to the transport stand. Lower the core−unit onto the support in the upper position. Remove the hoists and move the core−unit from under the gantry.

(8) Move and align the fan−unit under the gantry. See Figure 1203.

(9) Remove parts from the storage box attached to the fan−unit pallet. Keep the parts in a clean area.

(10) Remove the twelve bolts and cover from the center of the PWA 85380 Fan−Unit Front Fixture.

(11) Loosen (counterclockwise as viewed from front) and remove the PWA 85381 Shipping Nut from the front of fan−unit.

(12) Remove the turbine shaft coupling assembly from the fan−unit as follows. See Figure 1203.

(a) Install two eyes to the PWA 85769 Coupling Fixture body assembly (detail−8, 21, and 19). Install a strap and lift the tool assembly.

NOTE: Be sure to make a mark on the tool to align with the disassembly vector (DV) mark on the coupling. The mark on the tool must align with the marks on the LPT shaft and the fan hub at assembly.

(b) Install the tool assembly to the coupling with the hoist. Retract the locating pin. Turn the plate (detail−21) to put the plate lugs behind the coupling lugs. Release the locating pin to lock the tool to the coupling.

(c) Remove the coupling and fixture from the fan−unit. Install a protective cover over the No. 1.5 bearing seal plate, and entire coupling. Move the coupling away from the gantry.

WARNING: BEFORE LIFTING THE FAN-UNIT, BE SURE THAT THE FAN-UNIT IS CENTERED UNDER THE GANTRY. DO NOT ALLOW THE HOIST TO MOVE NEAR THE END OF THE GANTRY RAIL OR PERSONAL INJURY CAN RESULT.

(13) Attach the PWA 85513 Sling to Hoist No. 1 and to the two lifting eyes on the PWA 85380 Fan-Unit Front Fixture. Put light tension on the sling. See Figure 1204.

(14) Find the three PWA 85383 Brackets that hold the fan-unit to the pallet. Loosen the jamnut on each bracket. Loosen the threaded rod that attaches the pallet bracket to each case bracket. Remove the four bolts that attach each case bracket to the case and the four bolts that attach the brackets to the pallet. Keep the bolts in the threaded holes of the brackets and pallet.

(15) Install the PWA 85659 Lifting Eye, with larger swivel rearwards, to the 12 o'clock position boss on the intermediate case. Attach the adapter with the bolts supplied with the adapter. Attach Hoist No. 2 to the smaller swivel. Put no tension on the hoist. Remove the PWA 85397 EEC Protector.

(16) Keep the fan-unit near the center of the gantry and use Hoist No. 1 to lift the fan-unit from the pallet. Remove the pallet from under the gantry. Use Hoist No. 1 and No. 2 to turn the fan-unit to assembly position.

(17) Remove the nineteen bolts that attach the PWA 85492 Fan-Unit Rear Fixture to the rear of the fan-unit. Keep the bolts in the threaded holes of the fixture. Remove the fixture and put it with the fan-unit pallet. Remove the PWA 85397 EEC Shield from the fan-unit. Remove the PWA 86355 Shield from the SCU (if equipped). Remove the pallet from the gantry area. See Figure 1205.

NOTE: Be sure that all the Flange E bolthole threads are serviceable. Repair any damaged threads.

(18) Remove the three bolts that attach the PWA 85618 Ring Retainer to the 1.5 bearing support. Remove the ring. Keep the three bolts in the three threaded holes of the ring.

(19) Install the PWA 85585 Guide Ring to the No. 1.5 bearing support with the three bolts kept with the tool.

WARNING: DO NOT ALLOW THE FAN-UNIT TO MOVE NEAR THE END OF THE GANTRY OR PERSONAL INJURY CAN RESULT.

(20) Install the PWA 85785 Adapter to the front fan hub. Turn the legs and engage the rear of the hub. Tighten the detail wing nuts to hold the legs in position.

(21) Move and align the core-unit under the gantry and behind the rear of the fan-unit. See Figure 1206.

(22) Remove protective covers and install the PWA 85390 Lifting Adapter to the two eighth-stage bleed openings. Attach with sixteen tool bolts. Tighten the bolts. Attach Hoist No. 4 to the adapter and put light tension on the hoist. Remove the four bolts that attach the front center support to the front of the pallet. Remove the support.

(23) Remove the six bolts and washers that attach the front inlet cone segment to the inlet cone segment. Remove the front segment. Hold the inlet cone segment and loosen the six hand-knobs of the PWA 85389 Support Ring. Push the end of each clamp in and turn to remove the inlet cone segment.

CAUTION: DO NOT SUPPORT THE FRONT OF THE CORE-UNIT BY THE TOOL COUPLING THAT IS INSTALLED ON THE FRONT OF THE CORE-UNIT. DO NOT PUT ANY FORCE OR STRESS ON THE TOOL COUPLING. TOO MUCH STRESS ON THE TOOL COUPLING CAN CAUSE DAMAGE TO THE NO. 2 BEARING SEAL NUT.

(24) Attach Hoist No. 3 to the PWA 85389 Support Ring on the front of the core-unit. Put light tension on the hoist.

(25) Remove the 33 bolts that attach the No. 2 bearing support to the PWA 85389 Support Ring. Remove the 48 bolts, nuts, and washers that attach Flange E to the ring. Carefully move the ring forward and remove it from the core-unit. Remove Hoist No. 3 from the ring and remove the ring from the gantry area.

(26) Attach Hoist No. 3 to the larger swivel of the PWA 85659 Adapter at the top of the intermediate case. Put tension on Hoist No. 3 to hold the rear of the fan-unit. Disconnect Hoist No. 2 from the adapter.

(27) Prepare the fan-unit for the installation of the core-unit as follows. See Figure 1207.

(a) Remove the protective caps, plugs, and covers from the openings on the rear of the fan-unit at
- the EEC PB sensing tube nut at 12:30 o'clock position
- the tube adapters of the two solenoids at 1 o'clock and 10 o'clock positions
- the No. 3 bearing air cooler adapters at 2:30 o'clock position
- the angle gearbox oil pressure adapter on the angle gearbox at 6 o'clock position
- the 1, 1.5 and 2 main bearing oil scavenge tube coupling at 7:30 o'clock position
- the cooling air supply tube at 10:30 o'clock position
- the EEC PT4.95 sensing tube nut at 11:30 o'clock position.

(b) For engines with a packing groove in the inside diameter of the HPC front case flange (Post SB PW4ENG 72-48), lubricate the new packing, PN 51H252, with White Petrolatum P06-002. Install the packing to the intermediate case Flange E lip. Be sure the packing stays against the Flange E surface.

(c) Install two PWA 85260 Guide Pins at approximately 3 and 9 o'clock positions on Flange E. Install two PWA 29855-7 Aligning Pins at approximately 6 and 12 o'clock positions on Flange E.

CAUTION: EXAMINE THE REAR OF THE FAN-UNIT. BE SURE THE WORKBOLTS THAT ATTACH THE NO. 1.5 BEARING SUPPORT TO THE INTERMEDIATE CASE DO NOT PROTRUDE ABOVE THE NO. 2 BEARING SUPPORT MATING FLANGE.

(d) Use a flashlight and examine the rear inner flange of the fan-unit. Be sure the work bolts that attach the No. 1.5 bearing support to the intermediate case do not protrude above the No. 2 bearing support mating flange.

(28) Prepare the core−unit for the installation of the fan−unit as follows. See Figure 1208.

(a) Remove the protective caps, plugs, and covers from the openings on the front of the core−unit at
- the EEC PB sensing tube coupling at 12:30 o'clock position
- the tube nuts that attach to the two solenoids at 1 o'clock and 10 o'clock positions
- the two No. 3 bearing air cooler tube nuts at 2:30 o'clock position
- the angle gearbox pressure tube nut at 6 o'clock position
- the No. 1, 1.5, and 2 bearing oil scavenge tube nut at 7:30 o'clock position
- the cooling air supply hose at 10:30 o'clock position
- the EEC PT4.95 sensing tube coupling at 11:30 o'clock position.

(b) Install two new packings, PN AS3209−162 and AS3209−334lubricated with Engine Oil P03−001, to the gearbox drive shaft housing. Install the retaining ring to the drive shaft and install the drive shaft into the drive shaft housing. Remove the protective cover and install the housing and drive shaft to the front of the gearbox and move rearward as far as possible. Engage the gearbox gear shaft and push the drive shaft as far rearward as possible.

(c) Install the packing, PN MS9386−388 lubricated with White Petrolatum P06−002, to the No. 2 bearing support packing groove.

CAUTION: BE SURE TO INSTALL THE OIL TRANSFER TUBE AT THIS TIME. FAILURE TO INSTALL THE TUBE WILL RESULT IN ENGINE DAMAGE.

(d) Install the oil transfer tube with two new packings, PN AS3209−010 and PN AS3209−111 (if required), lubricated with Engine Oil P03−001, to the oil nozzle.

CAUTION: DO NOT SUPPORT THE FRONT OF THE CORE−UNIT BY THE TOOL COUPLING THAT IS INSTALLED ON THE FRONT OF THE CORE−UNIT. DO NOT PUT ANY FORCE OR STRESS ON THE TOOL COUPLING. TOO MUCH STRESS ON THE TOOL COUPLING CAN CAUSE DAMAGE TO THE NO. 2 BEARING SEAL NUT.

(e) Be sure that the PWA 85388 Coupling is installed on the HPC and LPT shaft.

CAUTION: BE SURE ALL FLANGES ARE FREE OF ANY UNWANTED OBJECTS.

CAUTION: ONE PERSON MUST MONITOR THE INSTALLATION INSIDE THE BEARING AREA WITH A FLASHLIGHT. OTHERS MUST MONITOR THE EXTERNAL PARTS AND FLANGE E FOR CORRECT MATING.

(f) Remove the lockwire that attaches the PWA 85388 Coupling nut to the coupling on the front of the core−unit.

(g) Use PWA 85429 Wrench and remove the LPT shaft nut and washer. Install the PWA 86203 Guide to the LPT shaft threads and tighten by hand.

CAUTION: BE SURE AND ALIGN THE CORE−UNIT AND FAN−UNIT ACCURATELY. DO NOT PERMIT THE TOOL COUPLING ON THE FRONT OF THE CORE−UNIT TO TOUCH THE NO. 2 BEARING CARBON SEAL. DAMAGE TO THE SEAL CAN RESULT.

(29) Be sure the dowel pin on the front of the No. 2 bearing support is aligned with the dowel pin hole in the No. 1.5 bearing support flange. Carefully align and install the fan−unit to the core−unit until Flange E is almost together. Be sure the distance between the fan−unit and the core−unit at Flange E is approximately the same all around. Be sure the dowel pin on the front of the No. 2 bearing support is in the dowel pin hole in the No. 1.5 bearing support flange. Be sure the bevel gears will engage correctly. Be sure the oil transfer tube will engage.

NOTE: If necessary, rotate the HPC for the alignment of the bevel gears. To rotate the HPC, remove the two bolts, washers, and cover from the front of the gearbox adjacent to the fuel pump. Use a wrench and turn the drive under the cover.

NOTE: If removed, install a new packing (PN AS3209-121), lubricated with Engine Oil P03-001, the cover, washers, and bolts, threads lubricated with Engine Oil P03-001. Torque the bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(30) Attach the fan-unit to the core unit as follows. See Figure 1209.

CAUTION: REMOVE ALL THE WORK BOLTS THAT ATTACH THE NO. 1.5 BEARING SUPPORT TO THE FAN CASE. FAILURE TO DO SO COULD RESULT IN DAMAGE TO THE ENGINE.

(a) Lubricate the 33 bolts with Engine Oil P03-001 that attach the No. 1.5 bearing support and the No. 2 bearing support to the intermediate case. Remove the work bolts that are installed in the No. 1.5 bearing support flange. Install the 33 bolts and tighten by hand only.

(b) Lubricate the bolts with Antigalling Compound P06-021 that attach Flange E. Install the bolts and brackets to Flange E and tighten by hand only.

NOTE: Flange E has two configurations, the UPS configuration has 72 bolts and the other configuration has 74 bolts.

1 For engines with the 2.5 bleed actuator support bracket (Post SB PW4ENG 75-84) do the following.

a Align the three boltholes in the support bracket on the 2.5 bleed actuator with the three boltholes in the bracket on Flange E. Attach the two brackets together with nuts and bolts, threads lubricated with Engine Oil P03-001. Torque the nuts 85 - 95 lb-in. (9.604 - 10.734 N.m).

(c) Tighten the Flange E bolts and the bearing support bolts evenly at the same time to engage the snap diameters. Be sure that bevel gears align. Personnel must also monitor the external parts for correct alignment.

(d) Torque the Flange E bolts to 225 − 250 lb−in. (25.422 − 28.246 N.m). Remove the PWA 85260 Guide Pins and the PWA 29855−7 Aligning Pins and install the Flange E bolts. Torque these bolts to the same limits.

(e) Torque the 33 bearing support bolts to 180 − 200 lb−in. (20.337 − 22.597 N.m).

(31) Lower Hoist No. 1 and No. 4 so that the weight of the engine is on Hoist No. 3. Install the two transportation stand front supports to the intermediate case bosses at 3 and 9 o'clock positions. Attach the two supports to the case and transport stand.

(32) Remove the bolts that attach the PWA 85659 Lifting Adapter to the top of the intermediate case. Keep the bolts in the threaded holes of the adapter. Remove the adapter from the engine and from Hoist No. 3. See Figure 1204 (Sheet 2).

(33) Remove the PWA 85390 Lifting Adapter from the 8th stage duct openings. Install the 8th stage ducts as follows. See Figure 1206 and Figure 1210.

(a) Remove the sixteen bolts that attach the adapter to the openings on the HPC case. Keep the bolts with the adapter. Use Hoist No. 4 and remove the adapter. Install protection covers.

(b) Install the 8th stage ducts as follows. See Figure 1210 (Sheet 1) and Figure 1210 (Sheet 2).

1 Install the new gasket, PN MS9372−083, to the right HPC case opening and attach with Beeswax P05−395 or Paraffin Wax Blend P05−396. Install the new seal, PN 8757−350, to the right 8th stage duct elbow and attach with Beeswax P05−395 or Paraffin Wax Blend P05−396. Install the elbow and electrical bracket to the opening with eight bolts, lubricated with Engine Oil P03−001. Tighten by hand. Lubricate the coupling inside surfaces with Solid Film

Lubricant P06-013. Install the coupling to the elbow and duct. Tighten by hand.

2 Install the new gasket, PN MS9372-083,to the left HPC case opening and attach with Beeswax P05-395 or Paraffin Wax Blend P05-396. Install the left 8th stage duct and bracket to the opening with eight bolts, lubricated with Engine Oil P03-001. Tighten by hand.

3 Install the new seal, PN 8757-600, to the pressure regulating valve and attach with Beeswax P05-395 or Paraffin Wax Blend P05-396. Install the new seal, PN 2873-500, to the bottom opening of the midstage duct and attach with Beeswax P05-395 or Paraffin Wax Blend P05-396. Install the two new seals, PN 8757-350, to the 8th stage duct and left 8th stage check valve and attach with Beeswax P05-395 or Paraffin Wax Blend P05-396. Install the mid-stage duct in position. Attach the duct to the link with the bolt, lubricated with Engine Oil P03-001 washer, and nut. Torque the bolt to 480 - 690 lb-in. (54.233 - 77.960 N.m).

4 Lubricate the inside surfaces of the four couplings with Solid Film Lubricant P06-013. Install the couplings to attach the mid-stage duct to the 8th stage ducts, the high pressure bleed valve, and the pressure regulating valve. Tighten by hand.

5 Torque the bolts that attach the left and right 8th stage ducts to the HPC case openings to 65 - 85 lb-in. (7.344 - 9.604 N.m). For bolts with wire holes, install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

6 Torque all the couplings to the torque you see on each coupling. Tap the outer surface of each coupling with a plastic mallet while you torque the clamp nut.

7 Adjust the support link to a no-preload condition, then add one-half turn of tension adjustment to the support links. Torque the lock nuts to 100 - 140 lb-in. (11.298 - 15.818 N.m).

8 Lubricate the threads of the adapter on the mid-stage duct with Engine Oil P03-001. Connect the tube to the adapter and torque the tube to 180 - 200 lb-in. (20.337 - 22.597 N.m).

(34) Use Hoist No. 4 to remove the PWA 87275 Rear Lifting Eye, PWA 86415 Rear Lifting Eye or PWA 75174 Rear Lifting Eye. Remove the bolts and keep them in the threaded holes of the mount. Remove the adapter from the engine and from Hoist No. 4. See Figure 1202.

(35) Attach Hoist No. 1 to the top lifting eye of the PWA 85380 Fan-Unit Front Fixture. Remove the 19 bolts that attach the center ring to the fan hub. Remove the 60 bolts, nuts, and washers that attach the fixture to Flange A. Move the fixture forward and away from the engine. Remove the fixture from the gantry and put it on the fan-unit pallet. See Figure 1211.

(36) Loosen the legs and remove the PWA 85785 Adapter from the front fan hub. Loosen and remove the PWA 85388 Coupling Nut with the PWA 86225 Wrench. Loosen and remove the PWA 85388 Coupling with the PWA 86225 Wrench. Loosen and remove the PWA 86203 Guide.

NOTE: For ease of the coupling nut removal, loosen the thumbscrews on the PWA 86437 Fixture or PWA 86325 Fixture installed on the rear of the exhaust case. Tighten the thumbscrew again after the removal of the coupling nut.

NOTE: For ease of coupling removal, support the front of the LPT shaft with the end of the PWA 86203 Guide.

(37) Remove the PWA 85585 Guide Ring bolts. Remove the guide and keep the bolts in the threaded holes. See Figure 1212.

(38) Install the No. 1.5 bearing outer race (Post SB PW4ENG 72-253 only) as follows.

CAUTION: THE FRONT OF THE BEARING RACE HAS THE CHAMFER ON THE INSIDE DIAMETER.

(a) Install the transducer bracket dowel pins through the dowel pin holes on the front side of the bearing flange.

(b) Align the bracket dowel pins and install the bearing and bracket to the support.

(c) Install the seven double key washers, PN 51G068, and the fourteen shorter hex bolts, lubricated with Engine Oil P03-001, to the bearing flange boltholes without the bracket. Install the two key washers, PN 51G069, and two longer hex bolts at the bracket locations.

(d) (Reference 981) Tighten the bolts evenly in opposite pairs to engage the bearing to the support. Torque all the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m). Torque all the bolts again until the torque is held. Bend the key washers against the bolt heads.

(39) Install the turbine shaft coupling assembly as follows. See Figure 1213.

(a) Measure and write Dimension AJ of the fan hub assembly and Dimension AK of the coupling. See Figure 1213 (Sheet 1). Subtract Dimension AK from Dimension AJ for Calculated Dimension AL. Keep Dimensions AL for later use.

(b) Make sure the classified spacer is on the end of the LPT shaft.

CAUTION: UNWANTED MATERIAL IN THE NO. 1 AND 2 BEARING SUMP CAUSED AN IN-FLIGHT-SHUTDOWN.

CAUTION: MAKE AN INSPECTION OF THE NO. 1 AND 2 BEARING SUMP AREA BEFORE YOU INSTALL THE COUPLING. USE GLOVES. REMOVE ALL UNWANTED MATERIAL BEFORE YOU INSTALL THE COUPLING. See Figure 1213 (Sheet 2).

(c) Install the coupling assembly to the engine as follows. See Figure 1213 (Sheet 2).

1 Install the PWA 85769 Fixture shaft (detail-35) to the end of the LPT shaft. Tighten by hand.

2 Move the coupling (with fixture installed) under the gentry.

3 Install the arm (detail-1) to the adapter and eye. Attach Hoists No. 1 and 2 to the eye and arm.

4 Lift and turn the coupling to the horizontal position.

5 Apply Engine Oil P03-001 to the seal seat and to the coupling as shown in Figure 1213 (Sheet 3).

6 Install the coupling into the engine over shaft (detail-35). Align the disassembly vector (DV) marks and engage the splines of the coupling to the LPT shaft and fan hub.

7 Remove end cap/lift eye (detail-2) from adapter assembly (detail-3).

8 Install PWA 101021 Rod into the adapter assembly (detail-3) and turn the rod so that it is attached to the shaft assembly (detail-35).

9 Use a standard one inch (or equivalent) wrench to turn PWA 101021 Rod until the coupling is installed onto the LPT shaft.

10 Remove the PWA 101021 Rod, the lift arm assembly (detail-1) and the adapter assembly (detail-3) from the tool.

11 Install the locator (detail-27) to the front fan hub and tighten by hand. See Figure 1213 (Sheet 4).

12 Install and tighten the two rods (detail-36) to the body.

13 Install the two hydraulic cylinders (detail-16) and the two spacers (detail-26) over the rods.

14 Install the cover (detail-7) to the locator (detail-27) and attach with the six bolts (detail-41).

15 Install the nut (detail-11) to the shaft (detail-35) and tighten by hand.

CAUTION: BE SURE AND LOOSEN THE EIGHT THUMBSCREWS ON THE PWA 86437 FIXTURE OR PWA 86325 FIXTURE AT THE REAR OF THE ENGINE BEFORE YOU OPERATE THE PUMP OR DAMAGE TO TOOLS CAN RESULT.

16 Connect the hydraulic hoses to the cylinders and to the PWA 29389 Pump. Loosen the eight capscrews on PWA 86437 Fixture or PWA 86325 Fixture at the rear of the engine. Operate the pump to install the coupling fully.

17 Disconnect the pump and hoses. Remove the nut (detail-11), six bolts (detail-41), and the cover (detail-7). Remove the two spacers (detail-26), hydraulic cylinders, and the rods (detail-36). Remove the locator (detail-27) from the fan hub.

18 Use the hoist and install the adapter (detail-3), arm (detail-1), and eye with the four bolts (detail-4).

19 Retract the locating pin. Turn the plate (detail-21) to put the plate lugs between the coupling lugs. Release the locating pin.

20 Remove the tool. Remove the shaft (detail-35).

(d) Be sure the disassembly vector (DV) marks on the coupling, fan hub, and the LPT shaft align.

(e) (Reference 1008) Measure Dimension AL from the fan hub to the coupling. See Figure 1213 (Sheet 1). Measured Dimension AL must not be more than calculated Dimension AL + 0.003 inch (0.076 mm) nor less than calculated Dimension AL - 0.003 inch (0.076 mm).

(f) At the rear of the engine, remove the 16 tool bolts that attach the PWA 86437 Fixture or PWA 86325 Fixture to the exhaust case and the LPT shaft if used. Remove the retainer and keep the bolts with the threaded holes of the tool.

(g) If PWA 88222 Fixture was used, loosen the captured capscrews on the tube assembly detail and the guide assembly detail. Remove the retainer from the exhaust case.

(h) Apply Antigalling Compound P06-021 to the LPT turbine shaft nut, the coupling, and the LPT shaft as shown in Figure 1214. Permit to dry 5 minutes before installation.

CAUTION: BE SURE THAT THE WASHER IS PROPERLY INSTALLED AND SEATED IN THE COUPLING SHAFT ID. BE SURE THAT THE WASHER IS NOT IN EITHER GROOVE FORWARD OF THE SEAT.

(i) Install the washer and nut to the engine. Use the PWA 85429 Wrench and tighten by hand.

(j) Install the PWA 102460 Adapter or PWA 85299 Adapter into coupling and engage the teeth. Slide the three clamps outward and tighten the wing nuts to attach the tool. See Figure 1215.

(k) Install the PWA 85300 Wrench and engage the spline.

(l) Install the PWA 29614 Mechanical Wrench and PWA 86191 Torque Adapter.

(m) (Reference 971) Torque the LPT shaft nut as follows.

1 Torque the nut to 5000 - 7000 lb-in. (564.924 - 790.894 N.m).

2 Tighten the nut 43 - 47 degrees more.

3 Loosen the nut to zero.

4 Torque the nut to 4000 - 6000 lb-in. (451.939 - 677.909 N.m) and make a mark to refer the nut position to the coupling.

5 Tighten the nut 43 - 47 degrees more.

6 Loosen the nut and torque it again to 4000 - 6000 lb-in. (451.939 - 677.909 N.m).

7 If the nut location mark is aligned with the wrench mark or is beyond by two degrees maximum, add 43 - 47 degrees more.

8 If the marks are not in the limits above, repeat steps 4 through 7.

(n) Remove the tools.

(o) Install the key washer and retaining ring to the coupling and nut.

R
R
R
R
(p) Apply Anti-Seize Paste P06-054 to the turbine shaft (coupling/retaining) nut as shown in Figure 1214. Remove the unwanted paste. It is necessary to let five minutes to dry before installation.

(q) Install the nut and tighten by hand. See Figure 1216.

(r) Install the PWA 85301 Adapter into the coupling nut and engage the teeth. Slide the three clamps outward and tighten the wing nuts to attach the tool.

(s) Install the PWA 85302 Wrench over the adapter and engage the teeth. Slide the three clamps outward and tighten the wing nuts to attach the tool.

(t) Install the PWA 29614 Mechanical Wrench, the PWA 86191 Torque Adapter and the PWA 29615 Holder.

(u) (Reference 970) Torque the turbine shaft (coupling) nut as follows.

1 Torque the nut to 24,200 - 26,800 lb-in. (2734.44 - 3027.993 N.m).

2 Tighten the nut 18 - 20 degrees more.

3 Loosen the nut to zero.

4 Torque the nut again to 24,200 - 26,800 lb-in. (2734.44 - 3027.993 N.m) and make a mark to refer the nut position to the hub.

5 Tighten the nut 18 - 20 degrees more.

6 Loosen the nut and torque it again to 24,200 - 26,800 lb-in. (2734.44 - 3027.993 N.m).

7 If the nut position mark is aligned with the wrench mark or is beyond by two degrees maximum, add 18 - 20 degrees more.

8 If the marks are not in the limits above, repeat steps 4 through 7.

(v) Remove the tools.

(w) Install the new packing, PN MS9386-276 lubricated with White Petrolatum P06-002 and the plug to the coupling and nut. Install the key washer and retaining ring.

NOTE: The retaining ring must be fully in the groove of the turbine shaft (coupling/ retaining) nut, all around, and the ring end gap must be 0.010 inch (0.254 mm) minimum.

(40) Install the compressor inlet cone as follows. See Figure 1217.

(a) Align the disassembly vector (DV) mark on the inlet cone segment to the mark on the hub.

(b) Install the 19 bolts, lubricated with Engine Oil P03-001, and washers. Use a non-metalic blunt object (plastic scrapper or equivalent) and make sure the seal is installed under the fan blade platform leading edge before you tighten the bolts. Tighten and torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(c) Align the disassembly vector (DV) mark on the inlet cone front segment to the mark on the inlet cone.

(d) Install the six bolts, lubricated with Engine Oil P03-001, and washers. Tighten and torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(41) Install the eight bolts, lubricated with Engine Oil P03-001, and key washers, PN MS9276-10, that attach the installed No. 4 bearing retainer. Torque the bolts to 75 - 85 lb-in. (8.474 - 9.604 N.m). Bend the key washer tabs against the bolthead flats. See Figure 1218.

(42) Install No. 4 bearing oil scavenge (inner) tube. See Figure 1219.

(a) Remove protective cover from the mount pad recess in turbine exhaust case rear inner diameter.

(b) Install new gasket (1219/3) in groove in recess in exhaust case rear inner diameter.

(c) Align boltholes in flange of No. 4 bearing oil scavenge tube (1219/8) with boltholes in recessed mount pad in exhaust case rear inner diameter. Align bolthole in detail tube bracket with bolthole in exhaust case rear inner diameter. Secure tube using three bolts (1219/6) lubricated with Engine Oil P03-001 and key washers (1219/7). Torque bolts to 32 - 36 lb-in. (3.616 - 4.067 N.m). Bend tabs of key washers.

(43) (Pre SB PW4ENG 72-472) Install the No. 4 bearing (oil) nozzle and the No. 4 bearing packing transfer tube in the exhaust case No. 4 bearing compartment at the 1:30 o'clock position. See Figure 1220.

(a) Install the nozzle (1220/4) in the exhaust case and secure with key washers (1220/2 and (1220/3) and bolts (1220/1). Bend the tabs on the key washers.

(b) Install the No. 4 bearing packing transfer tube (1220/5) to the No. 4 bearing nozzle (1220/4) and secure with key washers (1220/6 and 1220/7) and bolts (1220/8). Bend the tabs on the key washers.

(44) (Post SB PW4ENG 72-472) Install No. 4 bearing (oil) nozzle and No. 4 bearing damper supply tube. See Figure 1221.

(a) Install the No. 4 bearing nozzle (1221/11) in the port in the pad on the exhaust case rear inner diameter at the 1:30 o'clock position. Install the nozzle with two bolts (1221/16) and (1221/17), with threads lubricated with Engine Oil P03-001, and two washers (1221/16) and (1221/17).

(b) Install the No. 4 bearing damper supply tube (1221/12) through the 0.380 inch (9.652 mm) diameter hole in the nozzle (1221/11) and into the port in the exhaust case rear flange. Install the damper tube with two bolts (1221/16) and (1221/17) with threads lubricated with Engine Oil P03-001, and washers (1221/16) and (1221/17). Torque the bolts that attach the nozzle to the exhaust case and bolts that attach the damper supply tube to the nozzle to 75 - 85 lb-in. (8.474 - 9.604 N.m). Bend the tabs of washers.

(45) (Post SB PW4ENG 72-472) Install No. 4 bearing front nozzle assembly and the packing transfer tube (damper tube to front nozzle). See Figure 1221.

(a) Lubricate two packings (1221/14) with Engine Oil P03-001. Install the packings in the grooves of the packing transfer tube (1221/15). Insert one end of the tube into the port in the front No. 4 bearing nozzle (1221/13).

(b) Align the boltholes in the flange of the front nozzle with the two retainer plate boltholes at the 12 o'clock position; and insert the nozzle through the hole in the No. 4 bearing support flange at the 1:30 o'clock position. Insert the end of the transfer tube in the port in the elbow of the No. bearing damper supply tube. Put the retaining plate (1221/2), chamfered side out, on the retainer plate pad (under the nozzle flange). Put the key washer (1221/1) over the oil nozzle flange, and install two bolts, with threads lubricated with Engine Oil P03-001.

(c) (Reference 90) Make sure that the clearance gap (1221/3) between the retaining plate and the grooves in the bearing outer race is in the limit specified in Index 2, Figure 1222. Torque the bolts that attach the retainer plate to 75 - 85 lb-in. (8.474 - 9.604 N.m). Bend the tabs of washer (1221/1).

CAUTION: YOU MUST APPLY ENGINE OIL FULLY TO THE COVER PACKING OR YOU WILL CUT THE PACKING DURING INSTALLATION. A CUT PACKING WILL CAUSE SUBSEQUENT OIL LOSS AND CAN CAUSE AN IN-FLIGHT SHUTDOWN.

CAUTION: INSTALL THE COVER INTO POSITION USING FOUR WORK BOLTS EQUALLY SPACED AROUND THE COVER. TIGHTEN THE BOLTS EQUALLY IN SMALL INCREMENTS TO PULL THE COVER INTO POSITION EQUALLY. MONITOR THE ENGAGEMENT OF THE COVER TO MAKE SURE THAT THE PACKING IS NOT CUT DURING INSTALLATION. A CUT PACKING WILL CAUSE SUBSEQUENT OIL LOSS AND CAN CAUSE AN IN-FLIGHT SHUTDOWN.

(46) Install the No. 4 bearing cover as follows: See Figure 1222.

(a) Apply Engine Oil P03-001 fully to the new packing PN AS3209-378.

(b) Install the new packing into the groove at the rear flange of the No. 4 bearing cover.

(c) Install the cover into the rear inner flange of the exhaust case.

(d) Install 4 work bolts equally spaced around the cover.

(e) Tighten the bolts equally in small increments to pull the cover into position equally.

(f) Monitor the engagement of the cover to make sure the packing is not cut.

(g) Remove the work bolts.

(47) Install the No. 4 bearing heat shield and (outer) shield over the cover. Align the boltholes. Install the 30 bolts, lubricated with Engine Oil P03-001. Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m). See Figure 1223.

(48) (Post SB PW4ENG 79-76) Install No. 4 bearing (oil) pressure tube. See Figure 1224.

(a) Remove protective cover from adapter (1224/5).

NOTE: The No. 4 bearing (oil) pressure tube of (Pre SB PW4ENG 79-76) would not have been removed for split-shipment.

(b) No. 4 bearing pressure tube option to prevent possible wear to the No. 4 bearing pressure tube (1224/14), a fiberglass tape wear Wrap P05-136, (1224/17) is provided as an option.

(c) Install the shield set (1224/15) and the heat shield insulation slide clamp (1224/16) on the elliptical section of the No. 4 scavenge tube (1224/14).

NOTE: The shield is installed on the section of the tube that goes through the strut of the turbine exhaust case.

(d) Install the shield set (1224/7) on the No. 4 pressure tube as follows.

1 Place the two halves over the round section of tube.

2 Install one restraining strap (1224/18) through the loops on the section of the shield that overlaps the shield set (1224/15).

3 Make tight the shield set on the tube by pulling the strap tight. Cut off excess strap material.

4 Put the loop clamp (1224/10) on the wear sleeve of the shield set and secure temporarily with a work bolt and nut.

(e) Attach bracket (1224/11) to the turbine exhaust case with two bolts (1224/8). Torque the bolts to 75 - 85 lb-in. (8.474 - 9.604 N.m).

(f) Install the No. 4 pressure tube through the strut at the 4:30 o'clock position.

1 Attach the tube nut to the adapter (1224/5), handtight.

NOTE: The shield may be separated to attach the tube nut to the adapter.

2 Remove the work bolt and replace with bolt (1224/9) and nut (1224/12) and attach to the bracket (1224/11).

3 Torque the tube nut to the adapter (1224/5) to 225 - 250 lb-in. (25.422 - 28.246 N.m). Safety the tube nut with lockwire.

4 Torque the bolt (1224/9) that attaches the clamp (1224/10) to the bracket (1224/11) to 32 - 36 lb-in. (3.616 - 4.067 N.m).

5 Install the four additional straps (1224/18) to hold the shield in place.

6 Make tight the shield set on the tube by pulling the straps tight. Cut off excess strap material.

7 Install bracket (1224/2) over the outboard end of the tube.

8 Position the nut (1224/4) on the outboard end of the tube and secure the nut to the tube with thrust wire (1224/19).

9 Attach the tube shield (1224/3) to the turbine exhaust case at the 4:30 o'clock position, pushing it on over the nut (1224/4). Line up the shield with the bracket (1224/2).

10 Install two bolts (1224/1) to retain shield and bracket and torque to 32 - 36 lb-in. (3.616 - 4.067 N.m). Safety the bolts with lockwire.

(49) Airflow check No. 4 bearing oil nozzle. See Figure 1225.

(a) Secure PWA 85501 Adapter to No. 4 bearing pressure tube located on outside of exhaust case at 10 o'clock position.

(b) Secure air inlet hose from CTE 5070 Airflow Cart or CTE 6070 to larger threaded hole of adapter.

(c) Secure pressure sensing line to remaining threaded hole on side of adapter.

(d) Airflow check nozzle at 10 psig (68.9 kPa). Airflow rate must be 6 - 20 lb/hr (2.72 - 9.07 kg/hr) for engines (Pre and Post SB PW4ENG 72-472).

(e) After airflow rate limits have been met, remove adapter and airflow cart from exhaust case.

(f) Make sure that the oil passage is not blocked.

(50) Move the gearbox driveshaft forward and engage the splines of the angle gearbox drive-coupling. Install the retaining ring to the ring groove in the angle gearbox. Be sure that the retaining ring is installed all the way in the groove. See Figure 1208 (Sheet 2).

(51) Move the gearbox driveshaft housing forward with the packings installed before. Align the housing with the angle gearbox. Install the two HPC case brackets with the four bolts, lubricated with Engine Oil P03-001 and tighten by hand. Install the six bolts, threads
R lubricated with Anti-Seize Paste P06-054, washers and
R nuts that attach the brackets and the driveshaft
R housing to the angle gearbox. Remove the unwanted
R paste. Ignore the washers against the brackets.
Torque the housing bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m). Torque the HPC bracket bolts to the HPC to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(52) Torque any clamp bolts that were loosened for access to the angle gearbox to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(53) Install the following parts to the bottom of the core-unit that were removed for shipping clearance. See Figure 1226.

(a) Remove the protection covers and install the pylon drain mast to the Flange P bracket. See Figure 1226 (Sheet 1). Attach the mast with two bolts, lubricated with Engine Oil P03-001, washers, and nuts. Torque the bolts to 50 - 70 lb-in. (5.649 - 7.909 N.m). Attach the drain tube, threads lubricated with Engine Oil P03-001 to the mast. Torque the tube to 450 - 500 lb-in. (50.843 - 56.492 N.m).

(b) Remove the protection covers and install the (rear) deoiler vent duct, threads lubricated with Engine Oil P03-001, to the (front) duct. See Figure 1226 (Sheet 2). Attach the tube with the bolt, lubricated with Engine Oil P03-001, and washer. Tighten by hand. Torque the tube nut to 950 - 1050 lb-in. (107.336 - 118.634 N.m). Torque the bolt to 65 - 75 lb-in. (7.344 - 8.474 N.m).

NOTE: The end of the vent duct must align with the centerline of the thrust reverser doors.

(c) Install the new packing, PN M83248-1-906, to the IDG drain tube adapter. Install the IDG drain pad tube adapter, threads lubricated with Engine Oil P03-001, to the IDG drain pad. Torque the adapter to 250 - 300 lb-in. (28.246 - 33.895 N.m).

(d) Remove the protection covers from the drain manifold assembly and the drain tubes and adapters. See Figure 1226 (Sheet 3) and Figure 1226 (Sheet 4). Lubricate the tube adapter threads with Engine Oil P03-001. Install the manifold assembly, with tubes attached to the bottom of the gearbox. Attach the assembly to the gearbox with three bolts, lubricated with Engine Oil P03-001, and washers. Torque the bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m). Attach the tubes to the closest connector above the assembly and tighten by hand. Install the clamp bolts, threads lubricated with Engine Oil P03-001, and washers and attach the drain tube clamps to the gearbox brackets. Torque the clamp bolts to 20 - 25 lb-in. (2.260 - 2.825 N.m). Torque the drain tube nuts to 300 lb-in. (33.895 N.m).

(e) Remove the protection covers from the starter shutoff valve and ducts. See Figure 1226 (Sheet 5). Install a new seal, PN 2873-400, between the intermediate duct and the lower duct. Install the new seal, PN A0863, between the starter and the lower forward duct. Lubricate the inside surface of the two couplings with Dry Solid Lubricant P06-013. Hold the shutoff valve and ducts (as a unit) in position and install the couplings. Tighten the couplings enough to hold the unit in position. Hit the perimeter of the clamps lightly with a plastic mallet while you torque the coupling nut to 120 lb-in. (13.558 N.m). Do this torque procedure again until the torque holds. Attach the two support link assemblies to the flange brackets with bushings, bolts, lubricated with Engine Oil P03-001, washers, and nuts. Torque the nuts to 50 - 70 lb-in. (5.649 - 7.909 N.m). Install the clamps that attach the harnesses to the valve. Install the cooling air hose to the top of the valve.

(f) Remove the protection covers and connect the harness connector to the starter valve receptacle. Tighten the connector by hand. Install the clamp bolts that attach the harness to the No. 4 bearing scavenge tube. Torque the clamp bolts to 32 - 36 lb-in. (3.616 - 4.067 N.m).

(54) Connect the EEC PB sensing tubes (AS19) at 12:30 o'clock position as follows. See Figure 1227.

(a) Do not lubricate the tube threads.

(b) Tighten and torque the tube nut to 135 - 150 lb-in. (15.253 - 16.948 N.m).

(c) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(55) Connect the HPC air valve supply tube (AA25) and signal tube (AA01) to the solenoid adapters at 1 o'clock position as follows.

R (a) Apply Anti-Seize Paste P06-054 to the threads of
R the two solenoid tube adapters. Remove the
R unwanted paste.

(b) Tighten and torque the supply tube nut (larger) to 225 - 250 lb-in. (25.422 - 28.246 N.m).

(c) Tighten and torque the signal tube nut (smaller) to 200 - 225 lb-in. (22.597 - 25.422 N.m).

(d) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(56) Connect the No. 3 bearing air cooler tubes (AP33) and (AP34) to the cooler at 2:30 o'clock position as follows.

(a) Apply Antigalling Compound P06-021 to the threads of both air cooler adapters.

(b) Tighten and torque both tube nuts to 825 - 900 lb-in. (93.212 - 106.686 N.m).

(c) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(57) For engines with PMUX or SCU, install the PT2.5 sensing tube (AS30) and manifold (AS31) as follows. See Figure 1227 (Sheet 2).

(a) Remove the protective covers.

(b) Do not lubricate the tube threads.

(c) Install the upper tube to the tube coupling at 1 o'clock position adjacent to the solenoid.

(d) Install the lower manifold to the upper tube.

(e) Install the six clamp bolts, lubricated with Engine Oil P03-001, and nut that attach the tube and manifold to the brackets. Torque the clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(f) Torque the upper tube nut to the tube coupling at 1 o'clock position to 135 - 150 lb-in. (15.253 - 16.948 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(g) Torque the upper tube to the lower manifold at 4 o'clock position to 135 - 150 lb-in. (15.253 - 16.948 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(58) Install the three bleed valve supply tubes (AA26), (AA27), and (AA29) as follows. See Figure 1227 (Sheet 3) and Figure 1227 (Sheet 4).

(a) Remove the protective covers.

R (b) Lubricate all the tube nut and coupling threads
R with Anti-Seize Paste P06-054. Remove the
R unwanted paste.

(c) Install the inboard tube (supply) to the upper tube nut at 2 o'clock position and to the solenoid adapter at 5 o'clock position. Attach the tube nut to the tube tee adjacent to the solenoid.

(d) Install the middle tube (left supply) to the tube coupling at 2 o'clock position and to the tube coupling adjacent to the solenoid at 5 o'clock position.

(e) Install the outboard tube (right supply) to the tube nut at 2 o'clock position and to the solenoid adapter at 5 o'clock position.

(f) Install the clamp bolts, lubricated with Engine Oil P03-001, spacer, and nut, that attach the tubes to the brackets and to each other. Torque the clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(g) Torque the lower tube nut of the inboard tube to the larger solenoid adapter to 225 - 250 lb-in. (25.422 - 28.246 N.m). Torque all of the remaining tube nuts to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to all the tube nuts.

(59) Install the fuel distribution valve supply tube (FM09) as follows. See Figure 1227 (Sheet 5) and Figure 1227 (Sheet 6).

(a) Remove the protective covers.

(b) Install the two packings, PN 227433, lubricated with White Petrolatum P06−002, and retainers PN 354120.

(c) Install the tube to fuel flowmeter and to the fuel metering unit. Tighten by hand.

(d) Install the clamp bolts, lubricated with Engine Oil P03−001, and attach the clamps to the HPC case brackets. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(e) Torque the tube nuts to 100 − 110 lb−in. (11.298 − 12.428 N.m). Loosen the tube nuts and torque them again to the same limits. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(60) Install the hydraulic pressure manifold (CP05) and oil cooler inlet return manifold (CR01) as follows. See Figure 1227 (Sheet 7).

(a) Remove the protective covers.

R (b) Lubricate all the manifold coupling and tube nut
R threads with Anti−Seize Paste P06−054. Remove the
R unwanted paste.

(c) Install the two manifolds to the two hoses at 3 o'clock position and to the manifolds at 5 o'clock position.

(d) Install the clamp bolts, lubricated with Engine Oil P03−001, and nut, that attach the manifolds to the engine brackets. Torque the clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(e) Torque the return manifold nuts (smaller) at each end to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(f) Torque the pressure manifold nuts (larger) at each end to 340 − 375 lb−in. (38.415 − 42.369 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(61) Install the compressor stator cylinder hydraulic pressure tube (CP12) and return tube (CR03) as follows.

(a) Remove the protective covers.

R R R (b) Lubricate the tube nut threads of the two tubes with Anti-Seize Paste P06-054. Remove the unwanted paste.

(c) Install the two tubes to the manifold tees and the cylinder adapters.

(d) Install the two clamp bolts, lubricated with Engine Oil P03-001, that attach the tubes to the Flange E bracket. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) Torque the return tube nuts (smaller) to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(f) Torque the pressure tube nuts (larger) to 225 - 250 lb-in. (25.422 - 28.246 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

CAUTION: MAKE SURE YOU CONNECT THE TUBES TO THE CORRECT CONNECTORS OR FAULT MESSAGES WILL BE GENERATED.

(62) Install the (IDG) air/oil cooler valve hydraulic pressure tube (CP13) and return tube (CR12) to the IDG heat exchanger at 4 o'clock position as follows. See Figure 1227 (Sheet 8).

(a) Remove the protection covers.

R R R R (b) Lubricate the (IDG) air/oil cooler valve hydraulic pressure and return tube nut threads with Anti-Seize Paste P06-054. Remove the unwanted paste.

(c) Install the two tubes to the manifold tees and heat exchanger adapters.

1 The CR12 tube is installed to the adapter that is furthest from the lower triangular pad on the exchanger. The CP13 tube is installed to the adapter that is closest to the lower triangular pad on the exchanger.

(d) (Reference 256) Torque the two forward tube nuts attached to the heat exchanger tube couplings to 140 - 160 lb-in. (15.818 - 18.078 N.m).

(e) Torque the return tube (CR12) (smaller nut) to the manifold tee to 200 - 225 lb-in. (22.597 - 25.422 N.m).

(f) Torque the pressure tube (CP13) (larger nut) to the manifold tee to 340 - 375 lb-in. (38.415 - 42.369 N.m).

(g) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to all the tube nuts.

(63) Install the (IDG) air/oil cooler valve drain tube as follows.

(a) Remove protection covers.

(b) Install the tube and cross tee to the IDG heat exchanger adapter and drain tubes rearward of Flange E.

(c) Torque the tube nuts to 300 lb-in. (33.895 N.m).

(64) Install the (upper) airframe (IDG) cooler tube (LS02) and the (lower) airframe (IDG) cooler oil tube (LS01) as follows.

(a) Remove protection covers.

(b) Install the new packing, PN M83248-2-116, lubricated with Engine Oil P03-001 to the flanged end of the upper tube.

(c) Install the tubes and tighten the tube nut on the (lower) tube handtight.

(d) Install the three bolts, lubricated with Engine Oil P03-001, and washers that attach the upper tube to the cooler. Torque the three bolts to 70 lb-in. (7.909 N.m).

(e) Install the clamp bolts, lubricated with Engine Oil P03-001, washers, and nuts that attach the tubes to the brackets. Torque the clamp bolts to 25 lb-in. (2.825 N.m).

(f) Torque the tube nut to 1000 lb−in. (112.985 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(65) Install the (upper) airframe IDG cooler outlet oil tube (LS03) as follows.

(a) Remove the protection covers.

(b) Install the packing, PN AS3209−116, lubricated with Engine Oil P03−001 to the packing groove at the flanged end of the tube.

R
R (c) Lubricate the tube nut threads with Anti−Seize Paste P06−054. Remove the unwanted paste.

CAUTION: BE SURE AND TORQUE THE LOWER TUBE NUT OF THE LOWER TUBE NEAR THE FUEL METERING UNIT.

(d) Install the tube with the three bolts, lubricated with Engine Oil P03−001 to the heat exchanger. Tighten the tube nut by hand. Torque the three bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m). Torque the two tube nuts to 675 − 750 lb−in. (76.265 − 84.739 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292. Install and torque the clamps, and clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(66) Connect the angle gearbox oil pressure tube (LP09) to the angle gearbox at 6 o'clock position as follows. See Figure 1227 (Sheet 9).

R
R
R (a) Apply Anti−Seize Paste P06−054 to the threads of the mating tube adapter on the angle gearbox. Remove the unwanted paste.

(b) Tighten and torque the tube nut to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(67) Connect the angle gearbox oil scavenge tube (LR01) to the angle gearbox at 6 o'clock position as follows.

(a) Remove protection covers. Install the new packing, PN AS3209-014 lubricated with Engine Oil P03-001, to the groove at the flanged end.

(b) Engage the flanged end into the angle gearbox boss. Install the two bolts, lubricated with Engine Oil P03-001. Tighten and torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(c) Install and torque all the clamp bolts that attach the tube to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(68) Install the 2.5 bleed valve cylinder hydraulic pressure tube (CP06), return tube (CR02), and drain tubes at 7 o'clock position as follows. See Figure 1227 (Sheet 10).

(a) Remove protection covers.

(b) Install the bleed valve cylinder drain tube to the forward adapter of the actuator and the drain tube tee. Install the clamp bolt, lubricated with Engine Oil P03-001, washer, and nut that attach the drain tube to the angle gearbox bracket. Torque the clamp bolt to 25 lb-in. (2.825 N.m). Torque all the drain tube nuts to 300 lb-in. (33.895 N.m).

(c) Apply Engine Oil P03-001 to the bleed valve cylinder return tube nut threads (largest diameter tube).

(d) Install the tube. Tighten and torque the tube nuts to 270 - 300 lb-in. (30.506 - 33.895 N.m).

R (e) Apply Anti-Seize Paste P06-054 to the bleed valve
R cylinder hydraulic pressure tube nut threads
R (smaller diameter tube). Remove the unwanted
R paste.

(f) Install the tube. Tighten and torque the tube nuts to 225 - 250 lb-in. (25.422 - 28.246 N.m).

(g) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to both tubes.

(69) Connect the No. 1, 1.5, and 2 bearing oil scavenge tube (LR03) at the 7:30 o'clock position as follows. See Figure 1227 (Sheet 11).

(a) Apply Engine Oil P03-001 to the tubes mating coupling threads.

(b) Tighten and torque the tube nut to 1300 - 1400 lb-in. (146.880 - 158.179 N.m).

(c) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(70) Connect the drain tube to the (left) air/oil heat exchanger as follows.

(a) Connect the drain tube to the inboard coupling at the air/oil heat exchanger. Tighten by hand.

(b) Torque the loose clamp bolts that attach the tube to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(c) Torque the drain tube nuts to 257 - 283 lb-in. (29.037 - 31.975 N.m).

(71) Install the (left) air/oil cooler hydraulic pressure tube (CP07) and the return tube (CR05) as follows.

(a) Remove the protection covers.

R (b) Lubricate the tube nut threads of the pressure
R and return tubes with Anti-Seize Paste P06-054.
R Remove the unwanted paste.

(c) Install both tubes (longer staighter ends) to the heat exchanger adapters and to the manifold tees. Install the clamp bolt, lubricated with Engine Oil P03-001, that attaches the (CP07) tube to the Flange E bracket. Torque the clamp bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(d) Torque the return tube (CR05) and the pressure tube (CP07) forward tube nuts attached to the heat exchanger to 200 - 225 lb-in. (22.597 - 25.422 N.m).

(e) Torque the return tube (CR05) (smaller nut) to the manifold tee to 200 - 225 lb-in. (22.597 - 25.422 N.m).

(f) Torque the pressure tube (CP07) (larger nut) to the manifold tee to 225 - 250 lb-in. (25.422 - 28.246 N.m).

(g) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to all the tube nuts.

CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTION USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF THE TUBE OR AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE EXTERNAL WIRE BRAID AND IN THE INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(72) Install the (left) air/oil cooler outlet oil hose and tube assembly (LP03) as follows. See Figure 1227 (Sheet 12).

(a) Remove the protection covers.

(b) Apply wet Zinc Chromate Primer P18-003 to the mating surface of the flange end. Do not apply any primer to the raised portion near the packing groove. Let it air dry for 10 minutes before assembly.

(c) Install the new packing, PN AS3209-217 lubricated with Engine Oil P03-001, to the packing groove at the flanged end.

(d) Install the new packing, PN 414121 lubricated with Engine Oil P03-001, and retainer, PN 354122, to the nut end of the tube.

(e) Lubricate the tube nut threads with Antigalling Compound P06-021 and install the tube to the fuel/oil cooler bypass valve and the air/oil heat exchanger.

(f) Attach the flanged end with the two inboard bolts, lubricated with Engine Oil P03-001. Tighten by hand.

(g) Install the clamp bolt, lubricated with Engine Oil P03−001, that attaches the tube to the HPC case bracket. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(h) Torque the tube nut to 200 − 220 lb−in. (22.597 − 24.857 N.m). Loosen the tube nut and torque it again to the same limit. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

NOTE: Torque the bolts at the forward end with the installation of the oil inlet tube.

(73) Install the (left) air/oil cooler inlet oil tube (LP02) as follows.

(a) Remove the protection covers.

(b) Install the two new packings, PN AS3209−217 lubricated with Engine Oil P03−001, to the tube ends.

(c) Install the tube to the heat exchanger and the main oil filter housing. Install the six bolts, lubricated with Engine Oil P03−001, that attach the tube.

(d) Install the bolt, lubricated with Engine Oil P03−001, and attaches the harness bracket to the tube. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(e) Torque the eight bolts that attach the two tube flanges to the heat exchanger and the one tube flange to the main oil filter housing to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(f) Install the drain tube and elbow to the front of the fuel/oil cooler and to the oil cooler bypass valve. Torque the tube nuts to 257 − 283 lb−in. (29.037 − 31.975 N.m).

(74) Install the main bearing oil pressure tube (LP05) to the last−chance strainer housing at 9 o'clock position as follows. See Figure 1227 (Sheet 13).

(a) Remove the protection cover.

(b) Install the new packing, PN 389114 lubricated with Engine Oil P03-001, and retainer, PN 354118, to the tube.

R (c) Lubricate the tube nut threads with Anti-Seize Paste P06-054. Remove the unwanted paste.

(d) Install the tube to the strainer housing adjacent to Flange E and above the fuel/oil cooler.

(e) Install the two clamp bolts, lubricated with Engine Oil P03-001, that attach the tube and the strainer housing to Flange E. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(f) Torque the forward tube nut to 675 - 750 lb-in. (76.265 - 84.739 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(g) Torque the rear tube nut to 140 - 160 lb-in. (15.818 - 18.078 N.m). Loosen the tube nut and torque it again to the same limits. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(75) Connect the HPC air valve and air shutoff valve supply tube (AA22) and the signal tubes (AA06) and (AA18) to the solenoid at 10 o'clock position as follows.

R (a) Apply Anti-Seize Paste P06-054 to the adapter threads on the solenoid. Remove the unwanted paste.

(b) Tighten and torque the (largest diameter) supply tube nut to 225 - 250 lb-in. (25.422 - 28.246 N.m).

(c) Tighten and torque the two (smaller diameter) signal tubes to 200 - 225 lb-in. (22.597 - 25.422 N.m).

(d) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(76) Install the cooling air hose to the HPC air valve cooling air tube (AC35) at 10:30 o'clock position as follows.

(a) Remove the protection cover.

(b) Install the hose over the tube.

(c) Install the hose clamp over the hose.

(d) Tighten the hose clamp by hand plus one turn.

(77) Install the main bearing breather tube (LB06) at 11:30 o'clock position as follows. See Figure 1227 (Sheet 14).

R (a) Apply Anti-Seize Paste P06-054 to the tube
R threads. Remove the unwanted paste.

(b) Install the tube and tighten the tube nuts by hand.

(c) Install the clamps and clamp bolts. Torque the clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(d) Tighten and torque the tube nuts to 1150 - 1300 lb-in. (129.933 - 146.880 N.m).

(e) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(78) Connect the EEC PT4.95 tube (AS04) at 11:30 o'clock position as follows.

(a) Do not lubricate tube threads.

(b) Tighten and torque the tube nut to 270 - 300 lb-in. (30.506 - 33.895 N.m).

(c) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

CAUTION: SEE 72-00-00, INSTALLATION-00 FOR NECESSARY GENERAL INSTALLATION INSTRUCTIONS ABOUT THE WIRING HARNESSES, LEADS, AND CABLES.

CAUTION: DO NOT TWIST OR BEND THE HARNESSES BADLY DURING THE INSTALLATION OR DAMAGE TO THE HARNESSES CAN RESULT.

CAUTION: EXAMINE THE HARNESS CONNECTORS AND THE RECEPTACLES FOR BENT PINS AND CONTAMINATION.

CAREFULLY MAKE STRAIGHT ANY BENT PINS AND CLEAN AS REQUIRED.

(79) Connect the W2 harness to the core-unit as follows. See Figure 1228.

(a) Remove the lockwire that attaches the W2 harness to the 12 o'clock strut. Adjust the harness in position. See Figure 1228 (Sheet 1).

(b) Connect the W2P26 harness connector to the HPC case bracket harness receptacle at 12 o'clock position as follows.

1 Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11-009. Let dry.

2 Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

3 Use the Glenair TG-70 Strap Wrench or the Glenair TG-69 Soft-Jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight.
- the connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts

are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(c) Attach the W2J9 harness receptacle to the HPC case bracket at 12 o'clock position. Install the retaining bracket and the two bolts, lubricated with Engine Oil P03-001. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(d) Install the clamp bolts, lubricated with Engine Oil P03-001, spacer, and nuts that attach the W2 harness to the Flange E bracket and the No. 1, 1.5 and 2 bearing breather tube. Torque the bolts to 36 - 40 lb-in. (4.007 - 4.519 N.m).

(80) Connect the W1 harness to the core-unit as follows.

(a) Remove the lockwire that attaches the W1 harness to the 12 o'clock strut. Adjust the harness in position. See Figure 1228 (Sheet 3) and Figure 1228 (Sheet 4).

(b) Connect the W1 harness connectors:
- W1P25 connector to the receptacle on the HPC case bracket at 12 o'clock position
- W1P11 and W1P10 connector to the receptacles on the 1 o'clock position solenoid
- airframe harness connector to the override pressure switch receptacle at 1 o'clock position
- W1P24 connector to the receptacle on the HPC case bracket at 10 o'clock position
- W1P9 connector to the receptacle on the HPC case bracket at 12 o'clock position
- W1P12 connector to the receptacle on the 10 o'clock position solenoid as follows. For each connector:

1 Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11-009. Let dry.

2 Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

3 Use the Glenair TG-70Strap Wrench or the Glenair TG-69Soft-Jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(c) Install the clamp bolts, lubricated with Engine Oil P03-001, and nuts that attach the W1 harness to the solenoid muscle tube and the Flange E bracket. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(d) Install the clamp bolts, threads lubricated with Engine Oil P03-001, and nuts that attach the W1 harness to the HPC case brackets. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(81) Connect the harnesses as follows.

(a) Attach the IDG heat exchanger harness receptacle to the HPC case bracket at 4 o'clock position. See Figure 1221 (Sheet 5). Install the retaining bracket and the two bolts, lubricated with Engine Oil P03-001. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m). Install the clamp bolts, lubricated with Engine Oil P03-001, and nuts that attach the harness to the hydraulic tube. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(b) Attach the (engine) air/oil heat exchanger harness receptacle to the HPC case bracket at 7:30 o'clock position. See Figure 1221 (Sheet 8). Install the retaining bracket and the two bolts, lubricated with Engine Oil P03-001. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(c) Connect the harness connectors:
- airframe harness connector to the IDG heat exchanger receptacle at 4 o'clock position
- W4P4 and W5P11 connector to the receptacles on the 5 o'clock position solenoid
- W3P15 connector to the receptacle on the 2.5 bleed valve actuator at 7 o'clock position
- W3P17 connector to the (engine) air/oil heat exchanger harness receptacle at 7:30 o'clock position
- W3P12 connector to the receptacle on the 10 o'clock position solenoid as follows. For each connector:

1 Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11-009. Let dry.

2 Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

3 Use the Glenair TG-70Strap Wrench or the Glenair TG-69Soft-Jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(d) Put the large IDG cables in position at 9 o'clock position. Install the clamps, screws, washers, and nuts. Torque the nuts to 25 - 35 lb-in. (2.825 - 3.954 N.m).

(82) Install the EEC speed transducer (N1) with or without the multiplexer input as follows. See Figure 1229.

(a) Remove the protective covers. Install the two new packings, PN AS3209-215 lubricated with Engine Oil P03-001 to the transducer shaft grooves. Install one new packing, PN MS9386-039 lubricated with White Petrolatum P06-002 to the transducer flange groove.

(b) Install the shim (attached to the probe) in the machined recess on the end of the transducer probe.

CAUTION: INSTALL THE TRANSDUCER WITH THE LARGE ELECTRICAL CONNECTOR REARWARD AS SHOWN. DO NOT TURN THE TRANSDUCER DURING INSTALLATION OR DAMAGE TO THE TRANSDUCER OR ENGINE CAN RESULT.

(c) Install the transducer to the intermediate case as shown, at approximately 5 o'clock position.

(d) For engines with the No. 1 bearing vibration transducer cable bracket, install the bracket to the two forward halves. Attach the transducer as follows. See Figure 1229 (Sheet 2).

1 Lubricate the bolts with Engine Oil P03-001.

2 Install the bolts and washers (key washers for engines without self-locking inserts). Tighten the bolts evenly by hand.

NOTE: Use the longer bolts at the bracket location (if equipped).

NOTE: (Post SB PW4ENG 72-182) Install the drilled bolt into the mounting hole next to the PT2.5 connection on the transducer.

3 For engines with the locating stud (Post SB PW4ENG 73-88), install the key washer and nut, lubricated with Engine Oil P03-001. Tighten by hand.

4 Torque (as equipped)
- the bolts without the self-locking insert feature to 65 - 85 lb-in. (7.344 - 9.604 N.m).
- the bolts with the self-locking insert feature to 85 - 95 lb-in. (9.604 - 10.734 N.m).
- the nut on the locating stud to 150 - 170 lb-in. (16.948 - 19.207 N.m).

5 Bend the key washer tabs if equipped.

(e) If equipped, install the clamp and bolt, lubricated with Engine Oil P03-001, and attach the No. 1 bearing vibration transducer cable to the bracket. Torque the clamp bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(f) For engines with the PMUX, install the PT2.5 sensing manifold to the probe at 5 o'clock position as follows.

1 Remove the protective covers.

2 Do not lubricate the tube threads.

3 Install the manifold. Tighten and torque the tube nuts to 135 - 150 lb-in. (15.253 - 16.948 N.m).

4 Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

NOTE: (Post SB PW4ENG 72-182) Safety the tube nut to the drilled transducer mount bolt.

(g) Connect the W4P19 and the W4P23 harness connectors to the transducer harness receptacles as follows. For each connector:

1 Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11-009. Let dry.

2 Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

3 Use the Glenair TG−70 Strap Wrench or the Glenair TG−69 Soft−Jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(h) Install the clamp bolt, lubricated with Engine Oil P03−001, and nut that attach the W4 harness to the bleed valve supply tube adjacent to the 5 o'clock position solenoid. Torque the clamp bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

CAUTION: BE VERY CAREFUL WHEN YOU REMOVE OR INSTALL A LINER SEGMENT. THE WASHERS THAT ARE ATTACHED TO THE LINER BRACKET CAN BECOME DISCONNECTED.

R
R

ALSO, IF THE EDGE OF THE LINER SEGMENT HITS SOMETHING, IT CAN DELAMINATE.

(83) Install the fan exit (inner) liner segment and the spacer plate to the fan case at 5 and 7 o'clock position. Attach with screws/bolts, lubricated with Engine Oil P03-001. Torque the screws/bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

NOTE: Screws are pre SB PW4ENG 72-107. Bolts are post SB PW4ENG 72-107.

NOTE: If the engine has acoustical liners, refer to 72-00-33, Installation-01 Task 72-00-33-420-001 for their installation.

(84) Install the forward anti-ice duct (tee), bottom anti-ice duct, and the oil tank overflow tube as follows. See Figure 1230.

(a) Remove the protection covers.

(b) Install the new seal, PN A0945, between the top and bottom ducts.

(c) Install the new seals, PN A0944 and PN 8757-250, to the forward anti-ice duct (tee).

(d) Lubricate the inside surface of the couplings with Solid Film Lubricant P06-013.

(e) Hold the ducts in position, with the seals installed, and install the couplings. Tighten the couplings only enough to hold the duct in position.

(f) Install the bolt, lubricated with Engine Oil P03-001, washer, and nut that attach the link to the duct. Torque the bolts to 50 - 70 lb-in. (5.649 - 7.909 N.m).

(g) Hit the perimeter of the couplings lightly while you torque the coupling nut to the value on the coupling. Do this torque procedure again until the torque holds.

(h) Torque the tube, threads lubricated with Engine Oil P03-001, to the adapter located on the top of the forward duct (tee) to 270 - 300 lb-in. (30.506 - 33.895 N.m).

(i) Remove the protection covers from the oil tank overflow tube. Lubricate the tube nut threads with Engine Oil P03-001.

(j) Install the tube to the tube connection adjacent to the front hydraulic pump. Tighten the tube by hand.

(k) Install the clamp bolts, lubricated with Engine Oil P03-001, washers, and nuts. Torque the clamp bolts to 20 - 25 lb-in. (2.260 - 2.825 N.m).

(l) Torque the tube nut to 300 lb-in. (33.895 N.m).

C. Postrequisites

(1) Install the forward engine mount. See the Airbus A300-600 Maintenance Manual, 71-21-01, Forward Engine Mount - Removal/Installation.

NOTE: The engine mount bolts must be examined before each installation. See the Airbus A300-600 Maintenance Manual, 71-21-00, Engine Mount Bolts - Inspection/Check.

(2) Install the exhaust plug cone. See the Airbus A300-600 Maintenance Manual, 78-11-02, Exhaust Plug Cone - Removal/Installation.

(3) Install the exhaust nozzle. See the Airbus A300-600 Maintenance Manual, 78-11-01, Exhaust Nozzle - Removal/Installation.

(4) Install the nose cowl. See the Airbus A300-600 Maintenance Manual, 71-11-00, Nose Cowl - Removal/Installation.

(5) Install the replacement power plant to the aircraft. See the Airbus A300-600 Maintenance Manual, 71-00-00, Power Plant - Removal/Installation.

POWER PLANT GENERAL − STORAGE/TRANSPORT−03

(6) Prepare (service) the replacement engine for power plant test and operation. See the Airbus A300−600 Maintenance Manual, 12−13−24, Servicing−02 − Replenish Or Fill IDG and 12−13−79, Servicing−02 − Fill The Engine Oil System.

(7) Test the replacement power plant. See the Airbus A300−600 Maintenance Manual, 71−00−00, Power Plant − Adjustment/Test. Do Test No. 2, 3, and 10 or 11 as applicable.

PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

Task 71-00-00-990-003:

1. Test Requirements After Engine/Module/Component Repair or Replacement

A. Description of Tests

(1) This section will tell you which test procedures are necessary after an engine, module or component is repaired or replaced. These tests are necessary to make sure that the engine operates satisfactorily after the repair or replacement.

(2) Test No. 9 provides for testing after engine has been completely disassembled, repaired and reassembled.

(3) Table 1301 for the list of tests.

TEST NO.	TASK	TEST DESCRIPTION
Test No. 1	Not Used	
Test No. 2	Task 71-00-00-760-029	Engine Motor Leak Test (Dry Method)
Test No. 2A	Task 71-00-00-760-001	Engine Motor Leak Test (Wet Method)
Test No. 3	Task 71-00-00-760-030	Idle Power Test
Test No. 4	Task 71-00-00-760-031	Power Acceleration/Deceleration
Test No. 5	Task 71-00-00-760-033	Oil System Static Leak Test
Test No. 6	Task 71-00-00-760-037	EEC System Idle Check
Test No. 7	Task 71-00-00-760-038	EEC System Static Test
Test No. 8	Task 71-00-00-760-032	Engine Vibration Survey
Test No. 9	Task 71-00-00-760-020, Task 71-00-00-760-060, Task 71-00-00-760-061 or Task 71-00-00-760-063	Engine Acceptance Test
Test No. 10	Not Used	Airframe Manual Only
Test No. 11	Not Used	Airframe Manual Only
Test No. 12	Task 71-00-00-720-003	Engine Oil System Vacuum Test
Test No. 13	Task 71-00-00-760-047	Main Oil Pressure Test and Adjustment
Test No. 14	Task 71-00-00-760-050	P2 System Leak Check)
Test No. 15	Not Used	
Test No. 16	Not Used	
Test No. 17	Not Used	
Test No. 18	Not Used	
Test No. 19	Task 71-00-00-760-043, Task 71-00-00-760-052 or	Trim Balance Procedure and Test

B. Test Reference Table - Engine, Modules and Primary Parts

(1) The applicable tests that are necessary after the repair or replacement for each module, primary parts or the engine are listed in Table 1302.

(2) If there is a selection of tests (example: 3 or 2), the first test listed is the recommended test.

(3) If more than one test is listed (example: 2,3,8, and 4), all the tests are necessary and must be done in the sequence shown.

ENGINE/MODULE/PRIMARY PARTS	NECESSARY TESTS
Complete Engine	12, 13, 9, 21* (Test 9 includes 3, 4, 6, 7 and 8)
Fan Blades	8
Fan Case Section	14, 8 and 21
Fan Exit Case Assembly	14 and 8 and 21
Low Pressure Compressor	12, 13, 9 and 21*
Intermediate Case Assembly	12, 13, 9 and 21*
High Pressure Compressor	9 and 21*
Diffuser Case	12, 13, 9 and 21*
Combustion Section	12, 13, 9 and 21*
Turbine Nozzle Assembly	9 and 21*
High Pressure Turbine	9 and 21*
Low Pressure Turbine	9 and 21*
Main Gearbox Assembly	12, and 3
Turbine Exhaust Case	12, 13, 8 and 21

* NOTE: Testing-21 must be done in the correct sequence within Testing-09 as shown in the "Engine Run Schedule" in Testing-09, Figure 1301.

Test Reference Engine, Modules, Primary Parts
Table 1302

ENGINE/MODULE/PRIMARY PARTS NECESSARY TESTS

NOTE: Exception 1 - Testing-21 is not necessary if the HPC Stage 5 through 15 blade tip clearances have been restored to the Fits and Clearances requirements (reference section 72-35-00 Inspection/Check-04), and the mid and rear hook of the HPC inner rear case are within serviceable limits, Indexes 8 - 11 of the PW4000 Series Engine CIR Manual (PN 51A357) Section 72-35-68 Inspection/Check-04 (Revision dated SEP 15/01 or subsequent), or the mid and rear hooks have been repaired or modified respectively, during this shop visit. If over allowable serviceable limits, the HPC inner rear case mid hook must be repaired in accordance with reference PW4000 Series Engine CIR Manual (PN 51A357) Section 72-35-68, Repair-16 and the HPC inner rear case rear hook must be modified in accordance with service bulletin PW4ENG 72-714, dated June 27, 2000, during this shop visit.

NOTE: Exception 2 - Testing-21 is not necessary for engines incorporating the Ring Case HPC configuration in accordance with SB PW4ENG 72-756 or SB PW4ENG 72-759.

NOTE: Exception 3 - Testing-21 is not necessary for engines intended to maintain the airworthiness of the engine between planned shop visits, that requires separation of a major engine flange located between "A" flange and "T" flange, that results in the engine being reassembled with all gas path-related components remaining in the as-removed condition.

NOTE: Exception 4 - Testing-21 is not necessary for engines that successfully passed Testing-21 with zero cycles since test, and are split at Flange "E" for transportation reasons as specified in the applicable Storage/Transport section of the applicable Engine Manual.

Test Reference Engine, Modules, Primary Parts
Table 1302 (Continued)

C. Test Reference Table - Components and Parts

(1) The applicable tests that are necessary after the repair or replacement for each component or part are listed in Table 1303.

(2) If there is a selection of tests (example: 3 or 2), the first test listed is the recommended test.

(3) If more than one test is listed (example: 2,3,8, and 4) all the tests are necessary and must be done in the sequence shown.

(4) If it is necessary to disconnect a tube or electrical connector to remove a component, more tests are necessary as follows:

   (a) If a fuel tube is disconnected, Test 3 is necessary.

   (b) If an oil tube is disconnected, Test 3 or 2 is necessary.

   (c) If an electrical harness is disconnected, Test 6 is necessary.

   (d) If a part is not listed, it is not necessary to do an engine test, (except for the tubes, manifolds and electrical harnesses shown above).

ENGINE/MODULE	NECESSARY TESTS
MAIN GEARBOX (Also see modules)	
Main Gearbox Assembly	12, and 3
Accessory Drive Seals (Any seal)	3
Manual Crank Pad Cover	3 or 5
ANGLE GEARBOX	
R Angle Gearbox Assembly	13 and 3
Cover − Lower Angle Gearbox	2

Probe - Input	6
Propulsion Multiplexer Unit - (PMUX)	6
Transducer - No. 1 Bearing	6

Test Reference Components or Parts
Table 1303 (Continued)

Task 71-00-00-990-005:

2. Engine Test Data Names

A. General
The abbreviations that follow are used for test data, engine stations and performance parameters. These parameters must be measured and checked during engine tests and calculations. Table 1304.

TEST DATA ABBREVIATION	TEST STATION OR PARAMETER
PAMB	Ambient Pressure
TAMB	Ambient Temperature
TT2	Fan Inlet Total Temperature
PCD	Test Cell Static Pressure
PT2	Fan Inlet Total Pressure
PS2	Fan Inlet Static Pressure
PT2.5	Low Pressure Compressor Discharge Total Pressure
PS3	Burner Case Static Pressure
PS4I	Turbine Cooling Air Static Pressure (Optional)
TT2.5	Low Pressure Compressor Discharge Total Temperature
TT3	High Pressure Compressor Discharge Total Temperature
TT4.95	Turbine Discharge Total Temperature
EGT	Turbine Discharge Total Temperature (EEC Readout)
PT4.95	Engine Pressure Ratio
PT4.95/PT2 − SEE NOTE A	Engine Pressure Ratio
EPR	Engine Pressure Ratio (EEC Readout)
EPR−0	Engine Pressure Ratio (EEC Readout With Neutral Class Data Entry Plug Installed)
TLRA − SEE NOTE B	Thrust Lever Resolver Angle (Signal Into EEC)
WF	Fuel Flow
FN	Net Thrust
TB	True Barometer
N1	Low Pressure Compressor RPM
N2	High Pressure Compressor RPM
SVA	Stator Vane Actuator Angle Position

NOTE A: PT4.95/PT2 is used when referring to the calculated ratio of measured PT4.95 and PT2 and is independent of EEC. EPR is defined as EPR as read from EEC and is to be used for acceptance of engine.

NOTE B: TLRA (Thrust Lever Resolver Angle) provides an electrical signal to EEC.

Engine Test Stations and Parameters
Table 1304

Task 71-00-00-990-002:

3. Test Instrumentation Calibration

A. General
The test instrumentation that is necessary for testing must be calibrated to the limits and tolerances that follow: See Table 1305.

TEST DATA ABBREVIATION	LIMITS AND TOLERANCES
TT2	±1°F (±0.5°C)
PCD	±0.02 psi (± 0.1 kPa)
PT2	±0.01 psi (0.1 kPa)
PS2 - NOTE A	±0.01 psi (0.1 kPa)
PT2.5	±0.06 psi (0.35 kPa)
PAMB	±0.005 psi (±0.03 kPa)
WF	0.75% accuracy for less than 4000 lb/hr (1814.4 kg/hr)
WF	0.4% accuracy for more than 4000 lb/hr (1814.4 kg/hr)
FN	±125 lbf (±556.0 N)
PS3	±0.5 psi (±3.4 kPa)
PS4I	±0.5 psi (±3.4 kPa) (Optional)
TT2.5 - NOTE A	±2.0°F (±1.0°C)
TT3 - NOTE A	±3.0°F (±1.7°C)
TT4.95	±3.0°F (±1.7°C)
PT4.95	±0.02 psi (± 0.1 kPa)
N1	±2 RPM
N2	±4 RPM
Tfuel	±1.4°F (±0.8°C)
TAMB	1.0°F (0.5°C)

NOTE A: When instrumentation is available.

Test Data Limits and Tolerances
Table 1305

Task 71−00−00−480−001:

4. Prepare The Engine/Power Plant For Test In A Test Cell

A. General

(1) This procedure will give the operator the necessary information to prepare and test the engine/power plant satisfactorily in a test cell.

(a) Before you do this procedure, you must assemble and inspect the engine powerplant by the assembly and installation procedures shown in this manual. See the assembly and installation procedures shown in Chapter 72. Also see the powerplant assembly and installation procedures shown in Chapter 71.

(b) Because of the many configurations of test cells and test cell equipment, this procedure will only give the necessary specifications, equipment and connections.

(c) Each operator must use their own experience and the recommendations of Pratt And Whitney Customer Support, to customize this procedure for each test cell.

B. Equipment And Materials

Standard Tools:

Test Cell	Qualified for each PW4000 engine model and thrust level. The test cell must be calibrated for performance measurement.
Test Adapter	Qualified for each PW4000 engine model and thrust level. The test adapter is the interface between the engine/powerplant and the test cell. The test adapter has the hardware necessary to mount and connect the engine/powerplant to the test cell
Drain Bottles And Hoses	Necessary to collect a measurable quantity of drain fluid from the engine drain ports. The hoses must be long enough to exit the bottom of the test adapter through the bottom of the core cowl.
Hoses And Electrical Leads	Necessary to monitor the test parameters during the acceptance test.
Crimpers	Necessary to crimp safety cable and

Standard Tools:

(CONTINUED)

ferrule. Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 26154	Probe, P2 (8 Necessary) (Superseded by PWA 88241)
PWA 29304	Bellmouth
PWA 29972	Seal Segment (Detail of PWA 85202)
PWA 85202	Adapter Ring
PWA 85523	Probe, EEC, Total Pressure and Temperature
PWA 85636	Bracket, Lifting (Bellmouth)
PWA 85703	Accelerometer And Lead Assembly (Flange P)
PWA 85774	Accelerometer Bracket (Flange P)
PWA 85927	Simulator, Thrust Reverser
PWA 86628	Connector (IDG Switch)
PWA 88241	Probe, P2 (8 Necessary) (Supersedes PWA 26154)

Consumable Materials:

Item No.	Designation
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)

C. Procedure

(1) Be sure all the EBU is installed correctly including:
- Exhaust nozzle and plug
- Front and rear engine mounts (if required for mounting to the operators' test adapter)
- Deoiler vent duct
- Engine starter, valve, and ducts
- IDG (only for test adapters and test cells capable of IDG operation and test)
- Drain system
- Fire detection loops
- Fuel flowmeter, pressure transmitter, and supply line
- 2.9 bleed valve bellows seals
- All oil indication probes and transmitters
- Oil filter differential pressure switch
- All fuel indication probes and transmitters
- Engine core compartment temperature sensors

- Fuel filter differential pressure switch
- Fan case vibration accelerometer
- TCC duct and bellows seal
- Right and left side accessory cooling manifolds, tubes, and hoses
- Fan case EBU electrical harnesses
- Engine core EBU electrical harnesses
- If necessary, the ECS 8th and 15th stage ducts and valves. Each must use their own test adapter. (Blank off plates must be used if these ducts are not installed for test).

NOTE: All the procedures for the components and hardware listed above are in Chapter 71 of this engine manual.

(2) Do not install the front and rear hydraulic pumps unless the test cell has special equipment to operate the hydraulic pumps.

(3) Do not install the IDG (integrated drive generator) unless the test cell has special equipment to operate these accessories during engine test.

NOTE: Most test cells do not have the necessary equipment to operate these accessories during engine test.

(4) Install the gearbox drive plugs as follows:

(a) Install the IDG drive gearshaft plug, bolt, and cover (only for test adapters and test cells not capable of IDG operation and test). See 72-00-61, Installation-21 Task 72-00-61-430-021.

(b) Install the rear hydraulic pump drive plug and cover. See 72-00-61, Installation-22 Task 72-00-61-430-012.

(c) Install the front hydraulic pump drive plug and cover. See 72-00-61, Installation-23 Task 72-00-61-430-013.

(5) Install the turbine vibration accelerometer to Flange P as follows:

(a) Install the PWA 85774 Bracket to Flange P at boltholes 18 and 19 (clockwise from top).

(b) Install the PWA 85703 Accelerometer And Lead Assembly to the bracket.

(6) If necessary, install the test drain bottles and hoses to the following drain ports, fittings, or tubes. Route the drain hoses so that the test adapter cowl doors can shut without interference.

(a) The IDG air/oil heat exchanger valve drain tube (3:30 o'clock position in the intermediate case).

(b) The 2.5 bleed valve actuator drain − FD19 (7 o'clock position in the intermediate case).

(c) The engine air/oil heat exchanger valve drain tube (8:30 o'clock position in the intermediate case).

(d) The fuel pump pad drain − SD2 (on the fuel pump, front of the main gearbox).

(e) The gearbox front hydraulic pump drive pad − SD4 (front of the main gearbox).

(f) The gearbox IDG drive pad − SD6 (rear of the main gearbox).

(g) The gearbox EEC alternator drive pad − SD8 (rear of the main gearbox).

(h) The gearbox starter drive pad − SD5 (rear of the main gearbox).

(i) The gearbox rear hydraulic pump drive pad − SD3 (rear of the main gearbox).

(j) The IDGS fuel/oil cooler front drain − AP21 (front of the fuel/oil cooler at 9 o'clock position).

(k) The fuel/oil cooler forward drain − AP24 (forward outboard side of the fuel/oil cooler at 9 o'clock position).

(l) The fuel/oil cooler rear drain − AP25 (rear outboard side of the fuel/oil cooler at 9 o'clock position).

(m) The fuel/oil cooler bypass valve drain − AP30 (under the fuel/oil cooler at 9 o'clock position).

(n) The TCC actuator drain − AP14 (on the HPC at 2 o'clock position).

(o) The SVA drain − FD17 (on the HPC at 5 o'clock position).

CAUTION: DO NOT LOWER THE TEST ADAPTER TOO FAR. DO NOT PUT THE WEIGHT OF THE TEST ADAPTER ON THE ENGINE OR DAMAGE TO THE ENGINE CAN OCCUR.

(7) Install the engine/powerplant to the test adapter. Tighten, torque and safety the engine mount bolts.

(8) Connect the engine core section (harnesses, ducts, hoses) to test adapter as follows:

(a) Connect all the necessary core engine harnesses to the test adapter electrical receptacles.

(b) Connect the Flange P turbine vibration accelerometer lead to the test adapter.

NOTE: Install the lead so that it does not touch the hot tubes/ducts or the test adapter doors when closed.

(c) If the bleed air environmental control system (ECS) duct is not installed, connect the starter air duct to the test adapter.

(d) If the bleed air (ECS) duct is installed, connect the bleed air (ECS) duct to the test adapter.

NOTE: If the test adapter does not connect to the bleed air (ECS) duct, be sure that the correct blank−off plates are installed.

(e) Connect the main fuel supply line (FM13) to the test adapter at the 1 o'clock position.

(9) Connect the test adapter leads and hoses to the engine core section as follows.

(a) Remove the EGT (TT4.95) junction box cover and connect the test adapter lead to the two forward studs (on the exhaust case at 6:30 o'clock position).

(b) Remove the PT4.95 plug, install the fitting, and install the test adapter line to the PT4.95 manifold (adjacent to the exhaust case at 6 o'clock position).

(c) Optional, remove the PS4I cap and connect the test adapter line to the diffuser case three bolt pad (11:30 o'clock position).

(d) Remove the PS3 cap and connect the test adapter line (if equipped) to the diffuser case (rear of the fuel injectors at 1 o'clock position).

(e) If used, connect the high temperature sensor test lead and probe to the diffuser case (AP8) port (11 o'clock position).

(f) If the IDG is installed, connect test adapter leads to the IDG Terminals (T0, T1, T2 and T3).

(g) If the IDG is installed, install a PWA 86628 Connector Assembly to the power supply line for the IDG override control switch.

(h) Remove the plug, install the fitting, and connect the MOP test adapter line to the fuel oil cooler outlet manifold (attached to the fuel/oil cooler at 9 o'clock position). LP1 port.

(i) Remove the elbow, install a fitting, and connect the (1, 1.5 and 2) breather pressure test adapter line to the (LB02) breather tube (9 o'clock position in place of the engine low oil pressure switch upper tube).

(j) Install and connect the oil filter differential pressure test adapter lines to the (LOW) forward LP5 port and the (HIGH) rear LP4 port of the switch (forward of the main oil filter housing at 7:30 o'clock position).

(k) Remove the plug, install the fitting, and connect No. 3 breather pressure test adapter line to the No. 3 bearing scavenge manifold (LR04) fitting (adjacent to the oil pump at 5:30 o'clock position).

(l) Remove the cap and install the PT2.5 test adapter line to the PT2.5 test tap (in the intermediate case recess at 5 o'clock position).

(m) If the thrust reverser is not used, attach a PWA 85927 Thrust Reverser Simulator. Connect the power supply cable to the input connector. Connect the EEC cable to the output connector.

(10) Connect the engine fan section to the test adapter as follows:

(a) Connect all the required fan case harnesses to the test adapter electrical receptacles.

(b) Remove the PAMB tube cap (adjacent to Flange A at 1 o'clock position).

(11) Install the special PWA tool adapters and bellmouth shown in Figure 1301 to the engine inlet as follows:

(a) Install the PWA 85202 Adapter Ring to the PWA 29304 Bellmouth with the PWA 29972 Segmented Rubber Seals.

NOTE: Align the adapter ring lifting eye with the bellmouth lifting eye and the adapter ring lifting eye towards the bellmouth.

(b) Secure the adapter ring to the bellmouth with the 16 detail cap screws, washers, and nuts.

(c) Remove the applicable plugs from the adapter ring and install the PWA 88241 PT2/PS2 Probe (supersedes PWA 26154 Probe) Attach the probes with the bolts.

(d) Install the PWA 85636 Lifting Bracket to the bellmouth and adapter ring. Secure bracket to the adapter ring with the four cap screws and to the bellmouth with the two cap screws.

(e) Lift the bellmouth and adapter ring (by the 2.00 inch (50.80 mm) lift hole) and install to the engine inlet. Secure with the detail washers, cap screws, and nuts.

NOTE: Put the washers under the cap screw head and under the nut.

(12) Install the PWA 85523 Probe to the bellmouth as follows:

  (a) Remove the plug from the bellmouth at 11 o'clock position.

    NOTE: The probe can be at a different circumferential location than the 11 o'clock position. The probe must be at the same circumferential location that was used to develop the test cell corrections.

  (b) Install the probe to the opening with the electrical connector rearward.

    NOTE: The probe has an offset bolt hole to ensure correct installation.

  (c) Attach the probe with the four cap screws. Torque the cap screws to 110 lb−in. (12.428 N.m).

(13) Connect the test adapter hoses and leads to the bellmouth connections as follows:

  (a) Connect the test adapter hoses to the eight PT2 probes.

  (b) Install a 4 foot (1.22 m) test hose from the PWA 85523 Probe (11 o'clock position) to the EEC PT2 tube (AS16) (adjacent to Flange A at 12 o'clock position).

  (c) Install the two test adapter leads to the PWA 85523 Probe (11 o'clock position).

(14) Record the EEC part number and serial number. Make sure that the correct EEC is installed

(15) Record the EEC programming plug part number and serial number. Make sure that the correct plug is installed or that the correct test plug is installed.

(16) Lift the test adapter and engine/power plant and transport to the test cell.

(17) Attach the test adapter to the test cell interface and make all the necessary connections.

(18) Service the:

(a) Engine oil

(b) IDG oil (if equipped)

(c) Starter oil.

(19) Inspect the engine fan exit and core areas.

(20) Close the test adapter engine test cowls and secure.

(21) Inspect the front of the engine, the fan exit, and the exhaust areas for possible FOD.

(22) Test the engine/power plant. See 71−00−00, Testing−00 Task 71−00−00−990−003.

Task 71−00−00−990−004:

5. Engine Safety Precautions

A. General
The Air Intake Suction Danger Areas. Figure 1302.

WARNING: STAY AWAY FROM THE DANGER AREAS AT THE FRONT AND THE SIDES OF THE ENGINE DURING OPERATION. THE ENGINE CAN MAKE ENOUGH SUCTION AT THE INLET DUCT TO PULL A PERSON UP TO, OR IN TO (IN PART OR FULLY) THE DUCT. THIS CAN KILL A PERSON OR CAUSE A VERY BAD INJURY.

WARNING: DO NOT GO IN THE TEST CELL WHEN THE ENGINE OPERATES ABOVE IDLE POWER. THE ENGINE SUCTION ABOVE IDLE CAN PULL A PERSON IN TO THE ENGINE INTAKE.

(1) The Air Intake. The air intake is in the front of the engine. There is a strong air suction when the air goes into the engine. The suction is very strong when the engine operates at takeoff power.

B. The Exhaust And Fan Discharge Danger Areas

WARNING: KEEP AWAY FROM THE FAN DISCHARGE AREA WHEN THE ENGINE IS STARTED AND WHILE THE ENGINE OPERATES. THE JET VELOCITY CAN MOVE A PERSON OFF HIS FEET AND CAUSE A BAD INJURY OR KILL A PERSON.

L−A2684 (0000)
PW V

Engine Test Cell Equipment
Figure 1301
(Task 71−00−00−480−001)

WARNING: EYE PROTECTION MUST BE WORN BY ALL PERSONS WHO WORK NEAR THE AIRCRAFT WHILE THE ENGINE OPERATES. AT HIGH ENGINE SPEEDS, THE EXHAUST CAN COLLECT AND BLOW LOOSE DIRT, STONES, SAND, AND OTHER UNWANTED MATERIAL A LONG DISTANCE.

WARNING: KEEP AWAY FROM THE EXHAUST AREA WHEN THE ENGINE IS STARTED AND WHILE THE ENGINE OPERATES. THE EXHAUST GASES HAVE A BAD SMELL AND CAN BE BAD TO BREATHE. THE GAS IS BAD FOR THE EYES. DO NOT BREATHE THE GAS OR LET THE GAS IN YOUR EYES (IN AREAS WHERE THERE IS A HIGH CONCENTRATION).

WARNING: AT SOME TIME, WHEN THE ENGINE IS STARTED, FUEL WHICH HAS NOT BEEN BURNED IN THE COMBUSTION CHAMBER CAN IGNITE IN THE EXHAUST AREA. THIS CAN CAUSE LONG FLAMES TO BLOW OUT OF THE EXHAUST NOZZLE. ALL PERSONS MUST KEEP AWAY FROM THE EXHAUST WHEN THE ENGINE IS STARTED. REMOVE ALL FLAMMABLE MATERIAL FROM THE AREA.

WARNING: THE EXHAUST GAS IS HOT WHEN THE ENGINE OPERATES AT IDLE OR HIGHER POWER. DO NOT GO IN THE PATH OF THE EXHAUST. THE SKIN CAN GET BURNED.

WARNING: DO NOT GO IN THE TEST CELL WHEN THE ENGINE OPERATES ABOVE IDLE POWER. THE ENGINE EXHAUST AND FAN DISCHARGE ABOVE IDLE CAN KILL A PERSON.

(1) The engine exhaust and fan discharge behind the engine is called the jet wake. Do not go behind the engine during engine operation. This area is very dangerous to persons because of the high temperature and high air velocity.

C. Engine Noise

WARNING: EAR PROTECTION MUST BE WORN BY ALL PERSONS WHO WORK NEAR THE ENGINE WHILE THE ENGINE OPERATES. THE LOUD NOISE FROM THE ENGINE CAN CAUSE TEMPORARY OR PERMANENT DAMAGE TO THE EARS.

WARNING: DO NOT GO IN THE TEST CELL WHEN THE ENGINE OPERATES ABOVE IDLE POWER. THE ENGINE NOISE ABOVE IDLE CAN DAMAGE YOUR HEARING WITH EAR PROTECTORS.

(1) You must wear ear protectors if you go in the test cell when the engine operates at idle power. Do not go in the test cell when the engine is operated above idle power.

(2) The loud noise from a jet engine can cause temporary or permanent damage to a person's ears. This damage can happen after a very short time if the ears are not protected. This damage can cause your hearing and sense of balance to decrease.

(3) Engine noise danger areas are provided in Figure 1303 for Ground Idle, Break−Away and Take−Off power settings.

D. The Engine Ignition System High Voltage

WARNING: DO NOT TOUCH ANY PART OF THE ENGINE IGNITION SYSTEM WHILE THE IGNITION OPERATES. THE IGNITION SYSTEM USES HIGH ENERGY WHICH IS DANGEROUS AND CAN MAKE ELECTRIC SHOCKS WHICH CAN CAUSE A BAD INJURY OR KILL A PERSON.

(1) The engine ignition system generates high energy and high voltage electricity. An electrical shock from this system can kill a person.

(2) The ignition system usually operates when the engine starts but the ignition system can also operate when the engine is not operated.

E. Hot Engine Parts

WARNING: DO NOT TOUCH, OR COME IN CONTACT WITH, NO. 3 BEARING BUFFER AIR COOLER OR ASSOCIATED TUBING FOR 3.0 HOURS AFTER ENGINE HAS BEEN SHUT DOWN. FAILURE TO COMPLY CAN RESULT IN SERIOUS BURNS.

(1) After engine operation, do not touch the No. 3 Bearing Buffer Air Cooler for 3 hours after engine shutdown. See Figure 1304. The No. 3 bearing buffer air cooler can reach 510 C (950 F) during high power running and requires 3 hours to cool.

(2) After engine operation, do not work or make an inspection on the hot section or the exhaust areas for 30 minutes, (preferably longer). Other engine parts can be examined sooner.

F. The Compressor Bleed Valve Discharge

WARNING: WHILE THE ENGINE IS IN OPERATION, STAY AWAY FROM THE BLEED VALVE. DURING ENGINE OPERATION, THE BLEED VALVE CAN OPEN. WHEN THE BLEED VALVE OPENS, HIGH PRESSURE AIR AT A HIGH VELOCITY COMES OUT. THIS AIR CAN MOVE A PERSON FROM HIS FEET AND CAUSE INJURY.

(1) During engine operation, the bleed valve can suddenly open and discharge high pressure, high velocity air out the side of the cowl. This air can move a person from their feet and cause an injury.

G. Fuel and Oil

WARNING: FUEL AND OIL CAN CAUSE THE SKIN TO DRY OUT. IF POSSIBLE DO NOT LET THE FUEL AND OIL TOUCH YOUR SKIN.

(1) Engine fuel and oil can make your skin dry if it touches your skin for a long time. If the fuel or oil touches your skin, remove the fuel or oil from your skin as soon as possible.

H. Pressurized Oil System

WARNING: DO NOT OPEN THE OIL TANK CAP FOR A MINIMUM OF FIVE MINUTES AFTER ENGINE SHUTDOWN. IF YOU OPEN THE CAP SOONER, HOT OIL CAN SPRAY ON YOU AND CAN CAUSE BURNS.

(1) The oil tank is pressurized during operation. The pressure slowly decreases after shutdown. Do not remove the oil tank cap for a minimum of five minutes after engine shutdown.

Task 71−00−00−760−002:

6. Precautions and Procedures For Safe And Correct Engine Operation

A. Precautions For The Air Intake

CAUTION: BEFORE THE ENGINE IS OPERATED, DO A CHECK OF THE AIR INTAKE, AND THE AREA NEAR IT. EXAMINE THESE AREAS VERY CAREFULLY FOR LOOSE OBJECTS WHICH COULD BE PULLED IN TO THE ENGINE.

(1) Clean the area in front of the air intake before the engine is operated. All loose objects must be removed.

B. Precautions For Deicing Fluid

WARNING: DO NOT APPLY DEICING FLUID WITH A SPRAY GUN IN TO THE ENGINE WHILE THE ENGINE IS IN OPERATION. THE DEICING FLUID WILL CAUSE CONTAMINATION OF THE AIRFOILS AND DETERIORATION OF PERFORMANCE WILL BE THE RESULT.

(1) Deicing fluid is sprayed on engine nacelles to remove and prevent ice. Do no spray deicing fluid in to the engine gaspath.

C. Precautions For X−rays

CAUTION: THE ELECTRONIC ENGINE CONTROL (EEC) CAN BE DAMAGED BY CONTINUED USE OF X−RAYS. THE EEC MUST BE REMOVED BEFORE THE USE OF X−RAYS.

(1) It is possible to use X−rays for a diagnostic inspection of the important parts inside the engine. The X−rays can damage the electronic engine control (EEC). Remove the EEC before you do any X−ray inspections.

D. Precautions For The Thrust Reverser

CAUTION: THE THRUST REVERSER MUST BE DISCONNECTED IN THE TEST CELL AT ALL TIMES. THE THRUST REVERSER MUST NOT OPERATE IN THE TEST CELL.

(1) If the thrust reverser is installed on the engine in the test cell, it must be disconnected and must not operate. The thrust reverser must not operate if the thrust lever is put in REVERSE.

E. Procedures For Thrust Lever Movement

CAUTION: A DETERIORATION OF THE PERFORMANCE CAN RESULT IF YOU DO NOT OBEY THE INSTRUCTIONS THAT FOLLOW.

(1) When possible, all thrust lever movements must be slow and smooth.

(2) A snap accelerations and decelerations will not cause a deterioration of the engine performance if you obey the instructions which follow:

(a) Before a snap acceleration, operate the engine at MINIMUM IDLE for at least five minutes after the first engine start.

(b) After a fast deceleration, operate the engine at MINIMUM IDLE for at least five minutes before an engine shutdown.

(c) If you operated the engine at high power (higher than 1.4 EPR) for more than 30 seconds (which includes the usual acceleration time), and then operate at MINIMUM IDLE, the idle time must be less than one minute or more than 10 minutes before you make a snap acceleration.

NOTE: It is possible to ignore the above recommendations for times at MINIMUM IDLE if you do a slow acceleration (60 seconds or longer) instead of a snap acceleration.

F. Tailpipe Fires During Engine Start

(1) If a tailpipe fire occurs during engine start, shut off the fuel and motor the engine to blow out the fire and decrease the engine exhaust temperature.

(2) For a tailpipe fire, do not obey the starter time limit. Operate the starter until the fire is out and the exhaust temperature is below the limits.

G. Dry Chemical Fire Extinguishing Agents

CAUTION: USE OF DRY CHEMICAL FIRE EXTINGUISHING AGENTS CAN CAUSE CORROSION OF THE ENGINE PARTS.

(1) Dry chemical fire extinguishing agents are not recommended.

(2) If dry chemical fire extinguishing agents are used, do the steps that follow:

(a) If both rotors are free to turn , and the EGT is less than 500 °C, dry motor the engine to blow the extinguishing agents from the engine.

(b) Do the requirements specified in SPOP 425. See 70-00, Standard Practices Manual, PN 585005.

CAUTION: DO NOT USE WATER TO REMOVE DRY CHEMICAL FIRE EXTINGUISHING AGENTS FROM THE ENGINE. IF WATER IS USED TO REMOVE DRY CHEMICAL FIRE EXTINGUISHING AGENTS, INCREASED CORROSION OF ENGINE PARTS CAN BE THE RESULT.

(3) Water is not recommended to remove dry chemical fire extinguishing agents. These agents are not water-soluble. Water can cause the agents to build-up and bond to the parts. This can cause decreased engine performance, corrosion and more damage if the engine is not cleaned correctly.

Task 71-00-00-990-007:

7. Engine Operation Limits

A. Exhaust Gas Temperature (EGT) Limits, Station 4.9 Harness Average

(1) Maximum Allowable Observed Exhaust Gas Temperature, at Station 4.95 for the applicable operating condition is listed in Table 1306 and Table 1307.

OPERATING CONDITION	TIME LIMIT (FOR PW4152 ENGINES)	MAX HARNESS AVERAGE - TT4.95
Take-Off	10 Minutes	644° C
Max. Continuous	Continuous	619° C
Starting (On Ground)	-	535° C

Maximum Observed EGT (TT4.95)
Table 1306

OPERATING CONDITION	TIME LIMIT (FOR PW4152 ENGINES)	MAX HARNESS AVERAGE - TT4.95
Starting (In Flight)	-	644° C
Acceleration	-	644° C
Max Reverse	-	644° C

Maximum Observed EGT (TT4.95)
Table 1306 (Continued)

OPERATING CONDITION	TIME LIMIT (FOR PW4156A, PW4158 ENGINES)	MAX HARNESS AVERAGE - TT4.95
Take-Off	10 Minutes	654° C
Max. Continuous	Continuous	629° C
Starting (On Ground)	-	535° C
Starting (In Flight)	-	654° C
Acceleration	-	654° C
Max Reverse	-	654° C

Maximum Observed EGT (TT4.95)
Table 1307

(2) EGT (TT4.95 Real as sensed at termocouples/prior to EEC shunt being applied) Certified Redline limits (°C):

(a) PW4152.....644°C (during ground starting, 535°C)

(b) PW4156A.....654°C (during ground starting, 535°C)

(c) PW4158.....654°C (during ground starting, 535°C)

(3) If EGT (TT4.95) from EEC exceeds red line limits given in step (2), the engine has been subjected to an overtemperature condition. Remedial action which must be taken depends on temperature level reached, length of time at temperature and condition at which engine operated at time. Perform applicable inspection as given in step (5).

CAUTION: WHEN TT4.95 LIMITS ARE EXCEEDED, UNDER CONDITIONS OTHER THAN SURGE, ENGINE SHOULD NOT BE SHUT DOWN ON AN EMERGENCY BASIS, BUT SHOULD BE COOLED FIVE MINUTES UNLESS IT IS OBVIOUS THAT CONTINUED OPERATION WILL RESULT IN ADDITIONAL ENGINE DAMAGE. REGARDLESS OF HOW THE ENGINE IS SHUT DOWN, IT SHOULD NOT BE RESTARTED UNTIL INSPECTION SHOWS THAT BOTH ENGINE ROTORS WILL ROTATE NORMALLY AND APPROPRIATE OVERTEMPERATURE INSPECTION REQUIREMENTS HAVE BEEN ACCOMPLISHED PER FOLLOWING STEP.

CAUTION: IF OVERTEMPERATURE IS ENCOUNTERED AS A RESULT OF SURGE, ENGINE MUST BE SHUT DOWN PER EMERGENCY SHUTDOWN PROCEDURE DESCRIBED IN PARAGRAPH TITLED, ENGINE SHUTDOWN PROCEDURE − EMERGENCY.

(4) All overtemperatures exceeding above noted limits must be recorded, including engine serial number, maximum temperature reached and duration. Attempt to determine and to correct the cause of overtemperature and perform a visual inspection. Refer to step (4) for visual or hot section inspections and to additional procedures if required.

(5) To Perform Engine Inspection Following Overtemperature refer to 72−00−00, Inspection/Check−10 Task 72−00−00−210−022.

B. Overtemperature Limits And Overtemperature Inspection Requirements

(1) Figure 1305 has been provided to define overtemperature limits and applicable overtemperature inspection requirements for engine operation during starting.

(2) Figure 1306 (Sheet 1), Figure 1306 (Sheet 2), Figure 1306 (Sheet 3) and Figure 1306 (Sheet 4) has been provided to define overtemperature limits (time versus EGT observed) and applicable overtemperature inspection requirements for engine operation other than start.

(3) All overtemperatures exceeding the base line limit of Figure 1305 and Figure 1306 (Sheet 1), Figure 1306 (Sheet 2), Figure 1306 (Sheet 3) and Figure 1306 (Sheet 4) must be recorded, including engine serial number, maximum temperature reached and duration.

C. Continue-In-Service Limit

NOTE: Continue-In-Service Limits may be applied as outlined in Figure 1305 and Figure 1306 (Sheets 1 through 4) including applicable notes provided:

(1) Area defining "continue-in-service limit" is not exceeded.

(2) Borescope inspection per 72-00-00, Inspection/Check-01F, Task 72-00-00-210-005, of 1st stage turbine blades and 72-00-00 Inspection/Check-01G, Task 72-00-00-210-006, 2nd stage turbine blades indicates they are free of damage (cracks, blistering of coating, elongation, etc.) and visual inspection of tailpipe shows no evidence of turbine failure.

D. Maximum Allowable Operating Speeds

(1) The Maximum Allowable Operating Speeds are listed below:

(a) Low Pressure Rotor, N1 - 4012 RPM (111.4% N1) (PW4152, PW4156A, PW4158, Engines)

(b) High Pressure Rotor, N2 - 10,300 RPM (104% N2) (PW4152 Engines)

(c) High Pressure Rotor, N2 - 10,450 RPM (105.5% N2) (PW4156A, PW4158 Engines)

NOTE: When overspeed limits are exceeded, the engine should be shut down as soon as possible in a normal manner unless it is obvious that continued operation will result in additional engine damage. The engine should not be restarted until the appropriate overspeed inspection requirements have been accomplished per 72-00-00, Inspection/Check-11, Engine Inspection Following Overspeed, Task 72-00-00-210-023.

(2) All overspeed incidents exceeding the limits noted above must be recorded including the engine serial number, maximum N1 or N2 speed reached and the duration over the N1 or N2 limit, if possible.

(3) Perform engine overspeed inspection per 72-00-00, Inspection/Check-11, Inspection/Check-11, Engine Inspection Following Overspeed, Task 72-00-00-210-023.

E. Oil Breather Pressure Limits

(1) No. 1 - 2 Bearing Compartment: For transient engine operation, the maximum breather pressure is 5 psig (34.5 kPa).

(2) No. 1 - 2 Bearing Compartment: For stable engine operation (after two minutes at any power setting), the maximum breather pressure is 3 psig (20.7 kPa).

(3) No. 3 Bearing Compartment: For transient engine operation, the maximum breather pressure is 180 psig (1241.1 kPa).

(4) No. 3 Bearing Compartment: For stable engine operation (after two minutes at any power setting), the maximum breather pressure is 160 psig (1103.2 kPa).

F. Fuel System Limits And Specifications

(1) Normal Fuel System Indications Are:

(a) Normal Fuel Flow Indications At Sea Level

1 Idle - 1200 pph (544 kgph) to 1600 pph (725 kgph)

2 Takeoff - 16,000 pph (7257 kgph) to 22,000 pph (9979 kgph)

NOTE: FUEL FLOW Indications out of above ranges should be investigated and any Necessary Maintenance Actions taken.

(b) Inlet pressure to the engine fuel pump must be:

1 20 − 50 psi (137.9 − 344.7 kPa) during all stabilized engine operations.

2 5 − 50 psi (34.5 − 344.7 kPa) during all transient engine operation conditions.

(2) Fuel System Specifications

(a) Fuel must conform to specifications of SB PW4ENG 2016.

G. Seal Leakage Limits

(1) Limits

(a) Table 1308 lists seal leakage drains provided on engine and indicates maximum drainage expected from each during operation and after shutdown.

COMPONENT SEAL	FLUID	LEAKAGE LIMIT (During operation and after shutdown)
Stator vane actuator drain port (FD17)	Fuel	60 cc/hour (20 drops/minute)
Station 2.5 bleed valve actuator drain port (FD19)	Fuel	60 cc/hour (20 drops/minute)
ENGINE Air/oil heat exchanger valve drain tube (CR09)	Fuel	30 cc/hour (10 drops/minute)
IDG air/oil heat exchanger valve drain tube (CR10)	Fuel	30 cc/hour (10 drops/minute)
TCC actuator drains port (AP14)	Fuel	30 cc/hour (10 drops/minute)
Gearbox Rear Hydraulic Pump Drive Pad Drain Port (SD3)	Oil	20 cc/hour (6 drops/minute)
Gearbox Front Hydraulic Pump Drive Pad Drain Port (SD4)	Oil	20 cc/hour (6 drops/minute)
Gearbox Starter Drive Pad Drain Port (SD5)	Oil	20 cc/hour (6 drops/minute)
Gearbox IDG Drive Pad Drain Port (SD6)	Oil	20 cc/hour (6 drops/minute)
Gearbox EEC Alternator Drive Pad Drain Port (SD8)	Oil	20 cc/hour (6 drops/minute)
Gearbox Fuel pump pad drain port (SD2)	Fuel	60 cc/hour (20 drops/minute)
Gearbox Fuel pump pad drain port (SD2)	Oil	20 cc/hour (6 drops/minute)

Engine Seal Leakage Limits
Table 1308

COMPONENT SEAL	FLUID	LEAKAGE LIMIT (During operation and after shutdown)
(CONTINUED)		
IDG Fuel/Oil Cooler Front Drain Port (AP21)		No measurable leakage
Engine Fuel/Oil Cooler Front Drain Port (AP24)		No measurable leakage
Fuel/Oil Cooler Rear Drain Port (AP25)		No measurable leakage
Fuel/Oil Cooler Bypass Valve Drain Port (AP30)	Oil	10 cc/hour (3 drops/minute)

Engine Seal Leakage Limits
Table 1308 (Continued)

(b) If there is oil weepage from the No. 3 bearing weep tube into the turbine exhaust case (TEC) during test cell runs do the procedure that follows.

1 Clean with a rag to remove residual oil.

2 Perform an Test No. 9 Engine Acceptance Test, (Task 71-00-00-760-020).

3 Clear engine for return to service if oil consumption rate is less than or equal to 0.15 quart/hour and there is no standing oil in the turbine exhaust case.

H. Oil System Limits And Specifications

(1) Main oil pressure: 70 psid (482.6 kPa) Minimum. The main oil pressure is a differential pressure, Oil supply pressure minus No. 1 and No. 2 breather pressure.

(2) The main oil pressure limits that are necessary during engine operation are shown in 71-00-00, Testing-13, Main Oil Pressure Test And Adjustment, (Task 71-00-00-760-047).

(3) Pressure drop across main oil filter - 50 psid (344.7 kPa) Maximum

(4) Main oil temperature limits:

(a) 122°F (50°C) minimum oil temperature at idle before engine operation above idle.

(b) 325°F (162.8°C) maximum oil temperature at steady state continuous engine operation.

(c) 350°F (176.7°C) maximum oil temperature during transient engine operation for a maximum time limit of 20 minutes.

(d) If the oil temperature is more than the permitted limit, shut down the engine and find the cause of the high temperature. See 72-00-00, Inspection/Check-03, Perform Oil Overtemperature Inspection, (Task 72-00-00-280-053).

(e) No. 3 bearing compartment scavenge temperature: 60°F (33.3°C) maximum temperature differential above the main oil temperature.

(f) If the scavenge temperature is above the maximum limit, do a 4 degree/second TRA movement to idle power, then do an engine shutdown. Find the cause of the overtemperature and repair as necessary.

(5) Oil Specifications (See SB 238).

NOTE: Engine must be properly serviced prior to motoring or starting. See 72-00-00, Servicing-03, (Task 72-00-00-610-003).

(a) Approved oils are listed in latest issue of SB 238.

CAUTION: DO NOT MIX DIFFERENT BRANDS OF OIL.

(b) Oil consumption guideline maximum is 0.125 U.S. gal/hr (0.47 liters/hr). A sudden increase or continually increasing trend in oil consumption should be investigated.

NOTE: The oil quantity instrument in the test cell indicates the quantity of oil in the oil tank only. It does not include the quantity of oil in the engine. During operation of the engine, as much as 12 quarts (11.36 l) of oil can go from the oil tank to the engine. This causes the oil quantity indication to decrease by the same quantity. After the engine shuts down, oil drains from the engine back to the oil tank. As the oil returns to the oil tank, the oil quantity indication in the test cell shows an increase in oil quantity.

I. Vibration Limits

(1) The maximum allowable overall vibration levels are shown in Table 1309.

LOCATION	SINGLE AMPLITUDE	VELOCITY
Fan Case Flange A	2.5 mils (0.064 mm)	0.9 IPS (inches per second) (22.860 mm per second).
Turbine Exhaust Case Flange P	2.0 mils (0.051 mm)	0.9 IPS (22.860 mm per second).
If above maximum allowable vibration levels are exceeded, they are considered acceptable provided none of the following rotor related limits are exceeded		
High Rotor Flange A, P		0.8 IPS (20.320 mm per second)
Low Rotor Flange A	2.5 mils (0.064 mm) up to 2500 RPM N1	0.65 IPS (16.5 mm per second) above 2500 RPM N1
Low Rotor Flange P	2.0 mils (0.051 mm) up to 3200 RPM N1	0.65 IPS (16.5 mm per second) above 3200 RPM N1
For all operating conditions except transients. A additional 0.3 mils or 0.1 IPS amplitude is acceptable for each value noted above for transient operation		

Vibration Limits
Table 1309

(a) Highest acceptable level for each location is defined as mean vibration of meter reading after 30 seconds of stabilization at speeds where peaks have shown during acceleration, deceleration and steady stage running in normal operation range.

(b) If vibration average values exceed above vibration limits, a vibration survey should be run per 71-00-00, Adjustment/Test-08 Task 71-00-00-760-032 in that consistently high vibration values may be an indication of internal engine damage, improper rotor balance or engine is improperly assembled.

(2) Optional lower vibration values are shown in Figure 1307 (Sheets 1), Figure 1307 (Sheet 2) and Figure 1308 (Sheet 1), Figure 1308 (Sheet 2). You can use the optional lower vibration values as an alternative to the standard vibration values shown in paragraph (1) above.

(a) The optional reduced vibration values for the test cell will give more satisfactory results when the engine is installed on the aircraft.

Task 71-00-00-760-003:

8. Prime Engine Oil And Fuel System Procedure

NOTE: This procedure should be used whenever engine repair has resulted in oil compartments and/or fuel system being drained.

A. Prime Engine Oil And Fuel System

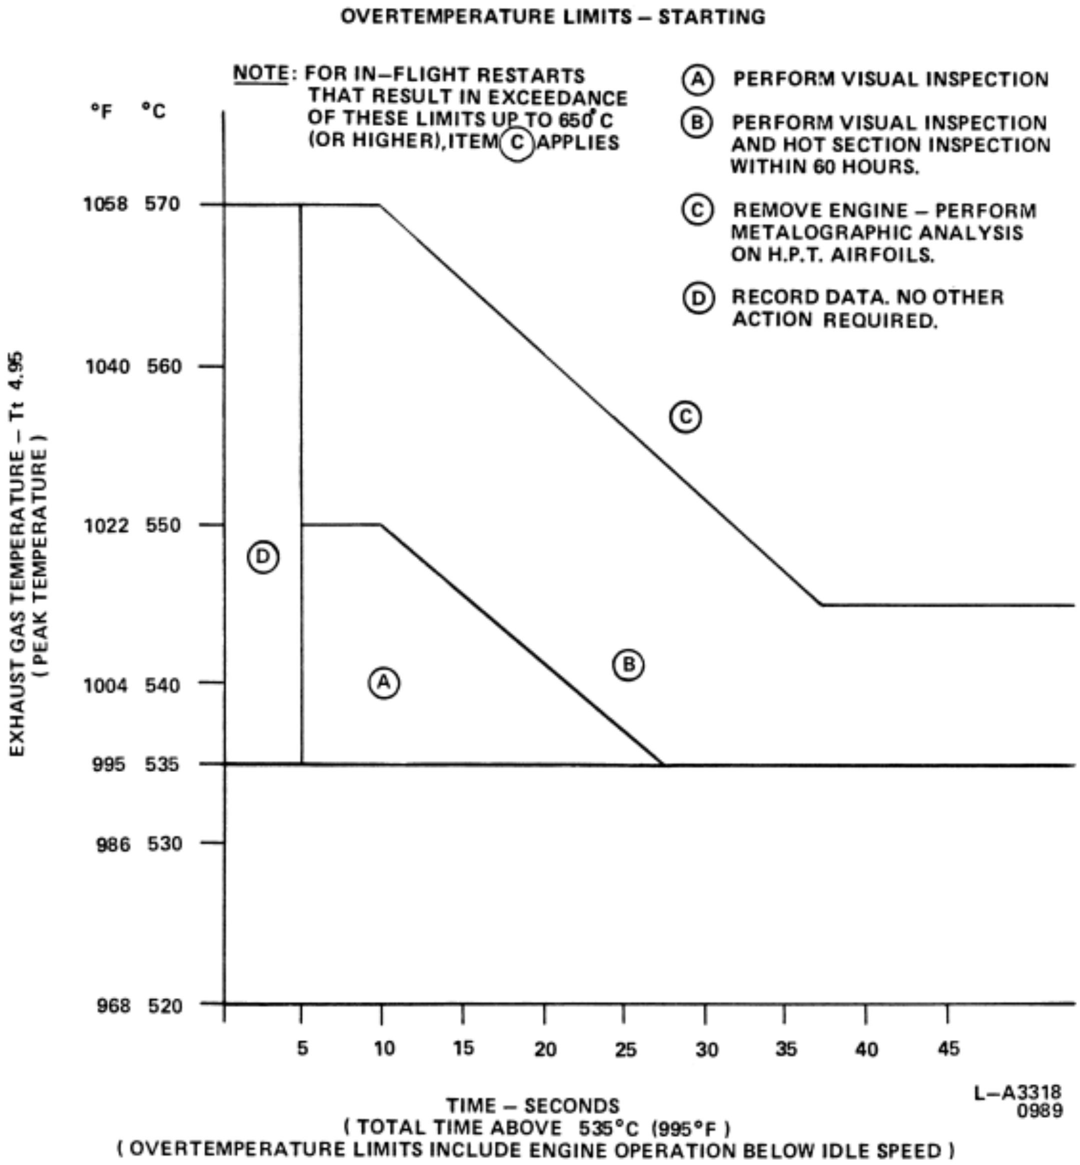
(1) Service oil system per paragraph on Specifications And Operating Limits - Oil System, refer to 72-00-00, Servicing-03, See 72-00-00, Servicing-03, Task 72-00-00-610-003.

(2) With ignition OFF or grounded, test cell fuel system ON, fuel metering unit condition lever in CUTOFF and thrust lever in IDLE motor engine at speed sufficiently high to ensure oil system is fully primed and oil pump maintains steady pressure

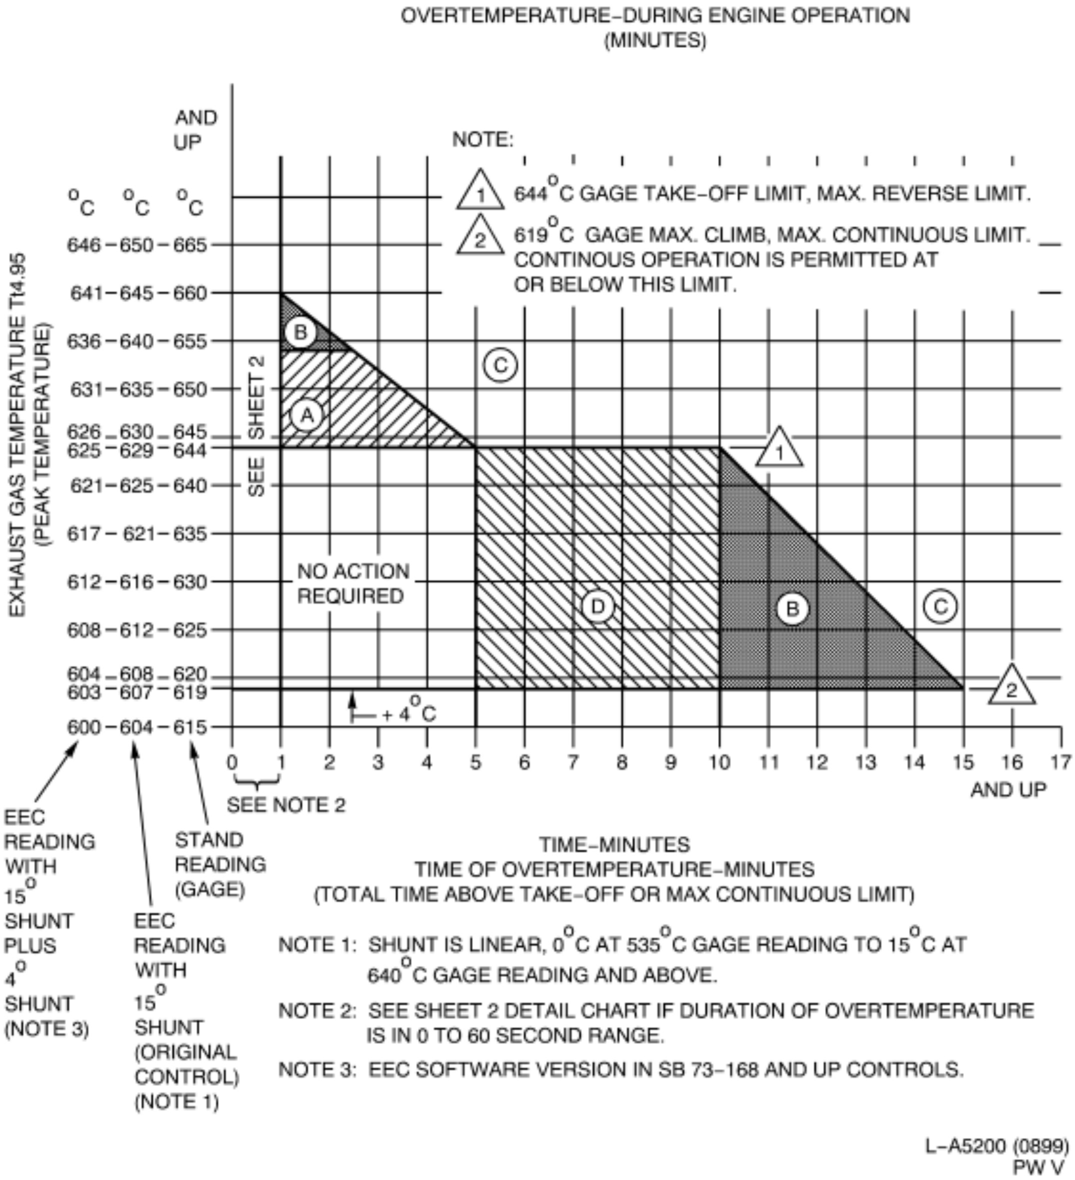
(3) Move condition lever to RUN at approximately 1500 rpm N2 observed for 30 seconds, then return condition lever to CUTOFF. Dry engine by motoring with condition lever at CUTOFF. Check that no fuel or oil is leaking to outside or into fan ducts

CAUTION: A MINIMUM OF FIVE MINUTES SHOULD ELAPSE AFTER ENGINE STOPPAGE BEFORE REMOVING OIL TANK FILLER CAP TO ALLOW TANK PRESSURE TO BLEED OFF.

(4) After priming, recheck oil tank quantity. An oil system that has been completely drained requires approximately 15 quarts of oil to fill plumbing, coolers, pumps and other oil system features. If servicing is required, refer to 72-00-00, Servicing-03, See 72-00-00, Servicing-03, Task 72-00-00-610-003.



Overtemperature Limits For Starting
And Engine Operation Below Idle Speeds
Figure 1305
(Task 71−00−00−990−007)



NOTE:

1 644°C GAGE TAKE–OFF LIMIT, MAX. REVERSE LIMIT.

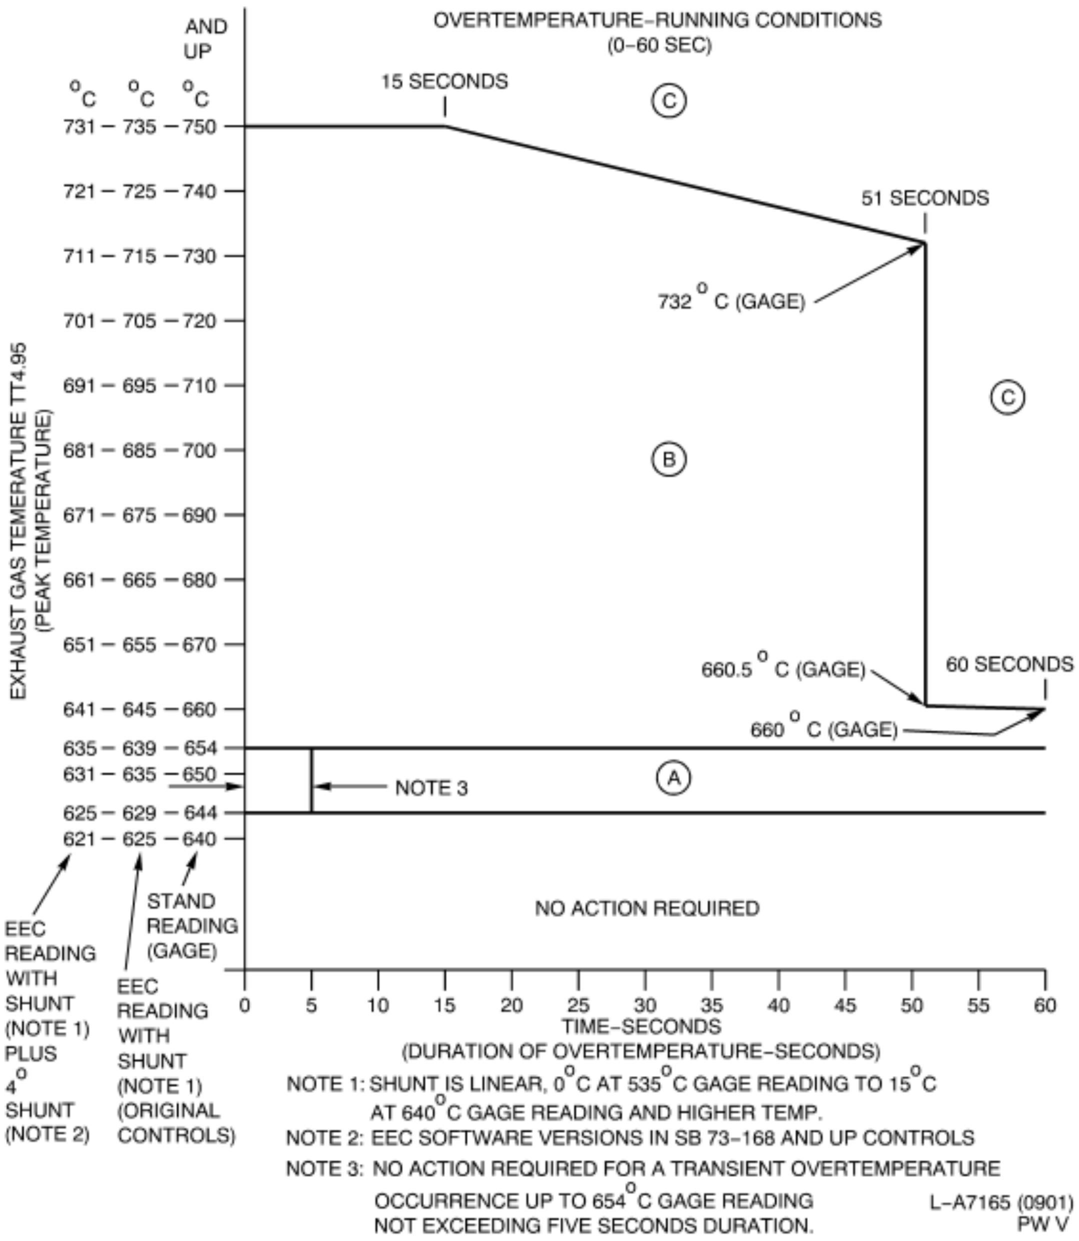
2 619°C GAGE MAX. CLIMB, MAX. CONTINUOUS LIMIT. CONTINOUS OPERATION IS PERMITTED AT OR BELOW THIS LIMIT.

NOTE 1: SHUNT IS LINEAR, 0°C AT 535°C GAGE READING TO 15°C AT 640°C GAGE READING AND ABOVE.

NOTE 2: SEE SHEET 2 DETAIL CHART IF DURATION OF OVERTEMPERATURE IS IN 0 TO 60 SECOND RANGE.

NOTE 3: EEC SOFTWARE VERSION IN SB 73–168 AND UP CONTROLS.

(PW4152) Overtemperature Limits − Running Condition (Minutes)
Figure 1306 (Sheet 1)
(Task 71−00−00−990−007)



NOTE 1: SHUNT IS LINEAR, 0°C AT 535°C GAGE READING TO 15°C AT 640°C GAGE READING AND HIGHER TEMP.

NOTE 2: EEC SOFTWARE VERSIONS IN SB 73-168 AND UP CONTROLS

NOTE 3: NO ACTION REQUIRED FOR A TRANSIENT OVERTEMPERATURE OCCURRENCE UP TO 654°C GAGE READING NOT EXCEEDING FIVE SECONDS DURATION.

(PW4152) Overtemperature Limits - Running Condition (0 - 60 Seconds)
Figure 1306 (Sheet 2)
(Task 71-00-00-990-007)

Chart Area	No. Of Occurrences	Inspection Requirements
A (See Note Below)*	1 − 15	(a) Record: (1) Engine serial no.; (2) Maximum temperature; (3) Time the EGT was over the limit (Takeoff or Max Continuous Limit) (4) Steady−state or surge conditions.

(Task 71-00-00-990-007)

Task 71−00−00−760−004:

9. Engine Starting Procedures (Normal)

A. Engine Starting Procedure

CAUTION: BOTH N1 AND N2 ROTORS MUST BE AT A COMPLETE STOP PRIOR TO INITIATING THE FOLLOWING PROCEDURE AND POSITIVE COMMUNICATION BETWEEN PERSONNEL INVOLVED IS MANDATORY TO PRECLUDE PERSONAL INJURY.

(1) Each of the steps below should be performed in sequence. In the event of an aborted start, the entire starting sequence may have to be repeated from the beginning. During starting, accessory loading should be minimized; however, it is acceptable to have bleeds ON.

NOTE: If engine does not respond as indicated below, discontinue start and check for unsatisfactory start reasons. If engine has been pressurized and no light, perform Clear Engine Procedure prior to restart.

(2) Set the prestart conditions that follow:

(a) Set fuel supply (boost pumps) − ON

(b) Set fuel select switch − CUTOFF

(c) Ignition switch − START A OR B

(d) Power lever − MINIMUM IDLE

(3) To begin the start sequence, turn starter motor switch on to start N2 (high pressure rotor) rotation.

NOTE: Discontinue start if the following is observed.

(a) No Rotation − High pressure rotor fails to rotate when starter is pressurized.

(b) Limited Rotation − High pressure compressor rotates but is unable to achieve normal rpm.

(4) Move the Fuel Lever to ON position when N2 reaches maximum motoring speed. Fifteen percent N2 is the minimum acceptable speed for placing the Fuel Lever in the ON position.

NOTE: Maximum motoring speed has been reached when a significant decrease in N2 acceleration is observed.

(5) Observe light-off. Light-off should occur within 20 seconds of pressurization as noticed by an increase in EGT. Engine will accelerate to minimum idle speed. Check EGT for normal temperature rise and N1 and N2 for normal acceleration. Continue to monitor until EGT peaks, decreases and stabilizes.

(6) Record fuel flow at engine light-off. Fuel flow rate must be between 550 and 650 pph (249 and 295 kph) during normal start.

(7) N1 should be rotating immediately prior to fuel pressurization as observed by N1 rpm indicator.

CAUTION: MONITOR BOTH EGT AND N2 CLOSELY DURING START FOR AN IMPENDING HOT START. IF EGT IS CLIMBING RAPIDLY THROUGH 535 C AND N2 ACCELERATION IS SLUGGISH, DISCONTINUE START IMMEDIATELY. CONTINUE TO MOTOR ENGINE UNTIL EGT PEAKS THEN DECREASES.

(8) Monitor the N1, N2 speed carefully during the start procedure.

CAUTION: IF STARTING EGT EXCEEDS 535° C, RECORD PEAK TEMPERATURE IN °C AND DURATION OF OVERTEMPERATURE IN SECONDS. SEE FIGURE 1305 SHOWN IN "ENGINE OPERATION LIMITS", Task 71-00-00-990-007 PARA B "OVERTEMPERATURE LIMITS AND OVERTEMPERATURE INSPECTION REQUIREMENTS".

(9) Monitor the EGT carefully, the EGT must peak less than 535° C.

(10) Monitor the oil pressure carefully, the oil pressure must increase.

(11) Abort the start procedure if any of the condition that follow occur:

(a) No light - burner does not light as evidenced by no rise in EGT within 20 seconds.

(b) Impending hot start - after light has occurred, EGT climbs very rapidly with sluggish or no acceleration of N2.

(c) Slow acceleration or hung start - after light, N2 or EGT increase very sluggishly (more than two minutes to accelerate to idle) or stabilize below idle. an indication of N1 rotation is not obtained prior to fuel pressurization.

(d) If fuel or ignition is inadvertently interrupted

(e) Abnormally high or low fuel flow.

(f) Increasing oil pressure is not observed.

(12) To abort the start, do the steps that follow:

(a) Put the fuel lever to: IDLE CUT-OFF.

(b) Turn the starter ON, (if the starter was disengaged) and dry motor the engine for 30 seconds minimum or until the EGT is less than 180° F (82.2° C).

(c) Dry motor the engine to blow away fuel in the engine that has not burned.

(d) If starter is already disengaged, re-engage when N2 is at or below 20 percent N2 rpm and motor engine as specified above). See Dry Engine Motor Procedure, Task 71-00-00-760-008.

(13) During the start procedure, record the data that follows:

(a) Record the maximum EGT.

(b) Record the maximum fuel flow.

(c) Record the time required to accelerate from pressurize to idle.

(14) Disengage starter motor at approximately 4800 N2 rpm. Observe starter cutout.

NOTE: Starter valve should be closed before engine reaches idle.

(15) During a normal start, turn the igniters OFF as soon as a successful start is assured and should remain off during all maintenance ground running to minimize possibility of overtemperature in event of compressor surge.

Task 71-00-00-760-005:

10. Normal Shutdown Procedure

A. Procedure For Normal Engine Shutdown

(1) Move the thrust lever to: MINIMUM IDLE.

CAUTION: DO NOT SHUTDOWN ENGINE WITHOUT ADEQUATE COOLING. TURBINE ROTOR SEIZURE COULD OCCUR.

(2) Operate the engine at MINIMUM IDLE for five minutes before you do an engine shutdown.

NOTE: Whenever an engine shutdown is to be performed after the engine has been previously run at or above a power setting of Band "D" (see Figure 1302, 71-00-00, Testing-09), the engine should be run at APPROACH IDLE for at least 20 minutes prior to shutdown. The engine may be restarted per the normal starting procedure. See Engine Starting Procedure (Normal), Task 71-00-00-760-004.

(3) After observing the cool-down recommendations stated above make sure the thrust Lever is at - MINIMUM IDLE

(4) Move fuel lever to cut-off position.

CAUTION: MAKE SURE THAT THERE IS AN ENGINE SHUTDOWN AS EVIDENCED BY INDICATION OF FUEL SHUT-OFF VALVE CLOSURE. CONTINUED ENGINE OPERATION AFTER PLACING THE FUEL LEVER IN OFF INDICATES A MALFUNCTION. MAINTENANCE ACTION IS MANDATORY.

(5) Check N2, EGT and fuel flow for immediate indication of engine shutdown.

(6) Check that the N1 and N2 RPM decrease and the rotors do not lock. The rotors must turn slowly and then stop.

(7) During deceleration, observe engine for evidence of internal fire or tailpipe fire. If internal fire or tailpipe fire occurs, perform Dry Engine Motor Procedure, Task 71-00-00-760-008.

(8) Check that the EGT (station 4.9) decreases.

(9) Check that the fuel flow goes to zero flow.

(10) Set the EEC input to: OFF.

(11) After the N2 rotor stops, turn the fuel boost pumps to: OFF.

(12) Confirm that ignition switch is in the OFF position.

Task 71-00-00-760-006:

11. Emergency Shutdown Procedure

NOTE: An emergency shutdown is a shutdown from power levels higher than MINIMUM IDLE. Use this emergency shutdown procedure only after emergency conditions which do not let you use a normal shutdown procedure.

A. Procedure For an Emergency Shutdown

(1) Quickly and immediately move the thrust lever to: MINIMUM IDLE.

(2) Quickly move the fuel lever to: CUT-OFF.

(3) Place starter motor switch ON when N2 rpm drops below 20 percent N2 rpm. See Dry Engine Motor Procedure, Task 71-00-00-760-008, to commence dry motoring cool down unless it is evident that further engine damage will occur.

(4) Continue to dry motor the engine until the EGT is less than 180° C.

(5) If the engine has a tailpipe fire, continue to dry motor the engine with the starter until the fire is out. Do not obey the starter time limits if the engine has a tail pipe fire.

(6) If the shutdown cause was other than a surge, tailpipe fire, or cause requiring a maintenance action, the engine may be restarted within 15 minutes (from the time of shutdown) if the rotors are free and no limits were exceeded. See Start Procedure After An Emergency Shutdown, Task 71−00−00−760−007.

(7) This procedure applies equally to abnormal shutdowns caused by inadvertent fuel supply interruption.

Task 71−00−00−760−007:

12. Start Procedure After An Emergency Shutdown

NOTE: Purpose of this procedure is to minimize damage to turbine blade tip seals if engine is restarted subsequent to an emergency shutdown.

A. Start Procedure After An Emergency Shutdown

(1) If the engine operated within the limits, there was no damage to the engine and if both rotors are free, it is recommended that the engine be started within 15 minutes of shutdown.

NOTE: This procedure will prevent locked turbine rotors and damaged turbine airseals.

(2) Use normal starting procedure previously described except select START/RUN when N2 reaches maximum motoring speed obtainable.

(3) Maintain IDLE speed for minimum of 15 minutes before accelerating to power.

(4) If restart cannot be accomplished within 15 minutes, then period of at least 50 minutes from time of shutdown must be allowed prior to restart attempt. (Attempting restart prior to 50 minute period may damage turbine blade tip seals).

(5) After 50 minutes from shutdown, do the steps that follow:

(a) Make sure both rotors turn freely for 360 degrees, (Turn the gearbox crank pad with a wrench to make sure that the N2 rotor turns a minimum of 360 degrees).

(b) If both rotors turn 360 degrees, dry motor the engine for two minutes by the Dry Engine Motor Procedure, Task 71-00-00-760-008.

(c) Stop the engine for five minutes.

(d) Dry motor the engine again for two minutes by the Dry Engine Motor Procedure, Task 71-00-00-760-008.

(e) Start the engine by the instructions in Engine Starting Procedures (Normal), Task 71-00-00-760-004.

(f) Keep the power at MINIMUM IDLE for 15 minutes before you move the thrust lever. Normal operation can continue after 15 minutes at MINIMUM IDLE.

B. Inspection Procedure After An Emergency Shutdown

CAUTION: WHEN ENGINE SHUTDOWN OCCURS QUICKLY, THE IGNITION LEAD CAN POSSIBLY NOT BE SUFFICIENTLY COOL. DAMAGE TO THE RUBBER BUSHINGS AND INSULATION CAN BE THE RESULT.

(1) Examine the ignition system leads at the terminal end (which is connected to the igniter) for signs of damage caused by high temperature after shutdown before the next start. See 72-00-00 Insp/Chk-10, Engine Inspection Following Overtemperature, Task 72-00-00-210-022.

Task 71-00-00-760-008:

13. Dry Engine Motor Procedure

A. General

(1) Use this procedure to blow away fuel that remains in the engine that has not burned.

(2) Use this procedure to decrease the temperature of the turbines after an emergency shutdown.

(3) Use this procedure for any operation where it is necessary to motor the engine without fuel to the combustion chamber.

B. Procedure For Dry Engine Motor

(1) Move the thrust lever to: MINIMUM IDLE.

(2) Move the fuel lever to: CUT−OFF.

(3) Put the ignition switch to: OFF.

(4) Turn the fuel boost pumps to: ON.

(5) Set the EEC input to: MANUAL START.

(6) Turn the switch for the starter air supply valve to: ON.

(7) Dry motor the engine for 30 seconds to remove the remaining fuel (fuel that was not burned) from the burner and turbines and to decrease the EGT below 180° C.

(8) If a large quantity of fuel remains in the low pressure turbine case, dry motor the engine for three minutes to remove the unwanted fuel.

(9) If the engine has a tailpipe fire, continue to dry motor the engine with the starter until the fire is out. Do not obey the starter time limits if the engine has a tailpipe fire.

(10) Turn the switch for the starter air supply valve to: OFF.

(11) Set the EEC input to: OFF.

(12) After the N2 rotor stops, turn the fuel boost pumps to: OFF.

Task 71−00−00−760−009:

14. Procedure After Engine Surge Or Stall

A. Procedure after engine surge or stall and EGT is in the limits. Do the steps which follow:

CAUTION: IF YOU DO NOT OBEY THE INSTRUCTIONS THAT FOLLOW, DAMAGE TO THE ENGINE CAN BE THE RESULT.

(1) Quickly and immediately move the thrust lever to MINIMUM IDLE.

(2) Operate the engine for five minutes at MINIMUM IDLE and continue the usual engine operation.

B. Procedure after engine surge or stall and EGT is above the limits. Do the steps which follow:

(1) Quickly and immediately (in less than one second) move the thrust lever to: MINIMUM IDLE.

(2) Operate the engine for five minutes at MINIMUM IDLE if:

(a) If the engine does not surge or stall at idle.

(b) If the EGT decreases to the usual idle value.

NOTE: If you know that continued operation will cause more damage or the EGT continues to increase, shutdown the engine immediately.

(3) Move the fuel lever to: CUT-OFF.

(4) Dry motor the engine until the EGT is less than 180° C. See Dry Engine Motor Procedure, Task 71-00-00-760-008.

(5) Make a record of how much time the temperature was more than the limit and the highest temperature for subsequent analysis. See 72-00-00 Insp/Chk-10, Engine Inspection Following Overtemperature, Task 72-00-00-210-022, for overtemperature instructions and analysis.

C. If there is an engine surge or stall where the EGT increases quickly, the rotor speeds decrease suddenly, and the engine operation will not follow thrust lever movement, do the steps which follow:

(1) Quickly and immediately move the thrust lever to: MINIMUM IDLE.

(2) Move the fuel lever to: CUT-OFF.

(3) Dry motor the engine until the EGT is less than 180° C. See Dry Engine Motor Procedure, Task 71-00-00-760-008.

(4) Start the engine again by the instructions in Start Procedure After An Emergency Shutdown, Task 71-00-00-760-007.

Task 71-00-00-760-010:

15. Procedure After Engine (EGT) Overtemperature

A. Procedure after engine overtemperature.

CAUTION: IF YOU DO NOT OBEY THE INSTRUCTIONS THAT FOLLOW, DAMAGE TO THE ENGINE CAN BE THE RESULT.

(1) Move the thrust lever to MINIMUM IDLE.

(2) Operate the engine at MINIMUM IDLE for five minutes unless:

(a) You know that continued operation will cause more damage.

(b) There is no decrease in EGT.

NOTE: If you know that continued operation will cause more damage or the EGT continues to increase, shut the engine immediately.

(3) After five minutes at MINIMUM IDLE, do an engine shutdown.

(4) Write how much time the temperature was more than the limit and the highest temperature for subsequent analysis. This step is very important. See Figure 1306 shown in "Engine Operation Limits", Task 71-00-00-990-007 para B "Overtemperature Limits and Overtemperature Inspection Requirements".

(5) If overtemperature is encountered as a result of surge, engine must be shut down as described in Procedure After Engine Surge Or Stall, Task 71-00-00-760-009.

Task 71-00-00-760-029:

1. Test No. 2 - Engine Motor Leak Test (Dry Method)

A. General

(1) Use this procedure to check the fuel system (except the fuel manifolds and nozzles) and the oil system for leaks. The engine is operated by the starter only for this test.

(2) The dry motor leak test uses the engine starter only to operate the engine for a short time to check for leaks in the fuel or oil system. The ignition system is OFF for this test. The fuel goes to the fuel pump (for pump lubrication) but not to the engine fuel manifolds and nozzles. This procedure is recommended for most motor leak checks unless the wet motor check is specified.

B. Equipment And Tools Necessary

Special Tools:

PWA 102757	Block Wedge (2 Necessary - Optional)

C. Procedure

(1) Make sure the thrust lever is in the OFF position.

(2) Make sure the ignition switch is in the OFF position.

(3) Make sure the oil quantity is correct.

(4) Supply fuel to the main fuel pump. The fuel pressure must be positive at the pump inlet.

(5) If N1 rotation is unwanted, install two PWA 102757 Wedges between two fan blades and the fan case at approximately the 6 o'clock position. The thinnest edge of the wedge must be centered onto the leading edge of the fan blade and then tapped into position, along the blade chord line, until they fit tightly in the fan blade to fan case clearance gap. See Figure 1301.

CAUTION: DO NOT OPERATE THE STARTER FOR MORE THAN THE STARTER TIME LIMIT. IF YOU DO, YOU CAN CAUSE DAMAGE TO THE STARTER.

(6) Open the starter air supply valve. Operate the starter for as long as necessary but do not operate for more than the starter time limit.

(7) Do a check of the main oil pressure. The pressure must be positive.

(8) Do a check of the N1 and N2 speeds. Both of the rotors must turn unless Wedges (PWA 102757) were installed, then only N2 will turn.

(9) While the engine is motored, do a visual check for leaks at the fuel and oil system tubes and joints.

NOTE: This procedure can be used to find a leak at any of the external fuel or oil system tubes and components. This procedure can also be used after a maintenance component remove and replacement procedure. It is only necessary to leak check the tubes, fittings and components that were removed and replaced (or loosened and tightened) at the last maintenance operation.

(10) Close the starter air supply valve.

(11) Stop the air pressure to the starter air supply valve.

(12) If Wedges (PWA 102757) were installed, remove the two wedges from the fan blade to fan case clearance gap.

Task 71−00−00−760−001:

2. Test No. 2A − Engine Motor Leak Test (Wet Method)

A. General

(1) Use this procedure to check the complete fuel system and the oil system for leaks. The engine is operated by the starter only for this test.

(2) The wet motor leak test uses the engine starter only to operate the engine for a short time to check for leaks in the fuel or oil system. The ignition system is OFF for this test. The fuel goes to the fuel pump, the engine fuel manifolds and nozzles. Fuel is then sprayed in the combustion chamber.

POWER PLANT GENERAL − TESTING−02

B. Equipment And Tools Necessary

Special Tools:

PWA 102757	Block Wedge (2 Necessary − Optional)

C. Procedure

(1) Make sure the thrust lever is in the OFF position.

(2) Make sure the ignition switch is in the OFF position.

(3) Make sure the oil quantity is correct.

(4) Supply fuel to the main fuel pump. The fuel pressure must be positive at the pump inlet.

(5) If N1 rotation is unwanted, install two PWA 102757 Wedges between two fan blades and the fan case at approximately the 6 o'clock position. The thinnest edge of the wedge must be centered onto the leading edge of the fan blade and then tapped into position, along the blade chord line, until they fit tightly in the fan blade to fan case clearance gap. See Figure 1301.

CAUTION: DO NOT OPERATE THE STARTER FOR MORE THAN THE STARTER TIME LIMIT. IF YOU DO, YOU CAN CAUSE DAMAGE TO THE STARTER.

(6) Open the starter air supply valve. Operate the starter for as long as necessary but do not operate for more than the starter time limit.

(7) Do a check of the main oil pressure. The pressure must be positive.

(8) Do a check of the N1 and N2 speeds. Both of the rotors must turn unless Wedges (PWA 102757) were installed, then only N2 will turn.

(9) When the N2 speed is 1500 RPM, move the thrust lever forward to the MINIMUM IDLE position.

(10) Operate the starter for 30 seconds maximum with the thrust lever at MINIMUM IDLE, then move the thrust lever to the OFF position. Do not operate the starter for more than the starter time limit.

POWER PLANT GENERAL - TESTING-02

(11) While the engine is motored, do a visual check for leaks at the fuel and oil system tubes and manifolds.

NOTE: This procedure can be used to find a leak at any of the external fuel or oil system tubes and components. This procedure can also be used after a maintenance component remove and replacement procedure. It is only necessary to leak check the tubes, fittings and components that were removed and replaced (or loosened and tightened) at the last maintenance operation.

CAUTION: DO NOT OPERATE THE STARTER FOR MORE THAN THE STARTER TIME LIMIT. IF YOU DO, YOU CAN CAUSE DAMAGE TO THE STARTER. IF NECESSARY STOP THE STARTER FOR 15 MINUTES BEFORE YOU DO THE NEXT STEP.

(12) With the thrust lever in the OFF position, operate the starter for 30 seconds. This step will blow the unwanted fuel out of the combustion chamber and turbines.

(13) Do a check of the fuel flow. The fuel flow must be zero.

(14) Close the starter air supply valve.

(15) Stop the air pressure to the starter air supply valve.

(16) If Wedges (PWA 102757) were installed, remove the two wedges from the fan blade to fan case clearance gap.

Task 71-00-00-760-030:

1. Test No. 3 - Idle Power Test

A. General

(1) Use this procedure to do an operation check of the EEC and check the fuel and oil systems for leaks. The engine is operated at IDLE power only for this test.

B. Procedure

(1) Start the engine by the Engine Starting Procedure (Normal), Task 71-00-00-760-004. See 71-00-00 Power Plant General - Testing-00.

NOTE: Monitor the main oil pressure, (MOP), during the start procedure. If you do not see any oil pressure, you must immediately and quickly stop the start procedure.

(2) Let the engine become stable for five minutes at MINIMUM IDLE.

(3) Make sure all the engine parameters are in the permitted limits.

(4) If necessary do an operational check of the EEC at this time. See Test No. 6 - Electronic Engine Control (EEC) Idle Test, Task 71-00-00-760-037.

WARNING: EAR PROTECTION MUST BE WORN BY ALL PERSONS WHO WORK NEAR THE ENGINE WHILE THE ENGINE OPERATES. THE LOUD NOISE FROM THE ENGINE CAN CAUSE TEMPORARY OR PERMANENT DAMAGE TO THE EARS.

WARNING: DO NO GO IN THE TEST CELL WHEN THE ENGINE OPERATES ABOVE IDLE POWER. THE ENGINE NOISE ABOVE IDLE CAN DAMAGE YOUR HEARING WITH EAR PROTECTION.

POWER PLANT GENERAL - TESTING-03

WARNING: DO NOT OPERATE THE ENGINE ABOVE IDLE POWER FOR THIS TEST. PERSONS ARE NOT PERMITTED IN THE TEST CELL ABOVE IDLE POWER.

(5) While the engine operates at idle power, do a visual check of the fuel and oil system tubes, fittings, manifolds and components for leaks.

NOTE: This procedure can be used to find a leak at any of the external fuel or oil system tubes and components. This procedure can also be used after a maintenance component remove and replacement procedure. It is only necessary to leak check the tubes, fittings and components that were removed and replaced (or loosened and tightened) at the last maintenance operation.

(6) Do an engine shutdown by the Normal Shutdown Procedure. See 71-00-00 Power Plant General - Testing-00, Task 71-00-00-760-005.

POWER PLANT GENERAL - TESTING-04

Task 71-00-00-760-031:

1. Test No. 4 - Power Acceleration/Deceleration

A. General

(1) This test checks engine takeoff power, 2.5 bleed valve scheduling and engine limit protection in primary EPR mode.

(2) For engine operation procedures, see 71-00-00 Power Plant General - Testing-00.

B. Procedure

CAUTION: IF AN ENGINE SURGE OCCURS DURING THIS TEST, YOU MUST QUICKLY MOVE THE THRUST LEVER TO MIN IDLE STOP WITHIN ONE SECOND OF THE SURGE. FOLLOW THE PROCEDURE AFTER ENGINE SURGE AND STALL, Task 71-00-00-760-009. FAILURE TO FOLLOW START PROCEDURE FOLLOWING EMERGENCY SHUTDOWN MAY RESULT IN DAMAGE TO TURBINE BLADE TIP SEALS.

(1) Prepare, service and start the engine by the Engine Starting Procedure (Normal), Task 71-00-00-760-004.

NOTE: If the engine is shutdown after a surge, follow the engine Start Procedure After An Emergency Shutdown, Task 71-00-00-760-007. This procedure will prevent engine blade tip rub damage.

(2) Let the engine become stable for 5 minutes at MINIMUM IDLE.

(3) Make sure all the engine parameters are in the permitted limits and make sure that there are no oil and fuel leaks.

(4) After five minutes operation at idle, slowly advance forward thrust lever to obtain 2.5 bleed closure and allow engine to stabilize. Record N1, N2, EGT, oil pressure and oil temperature.

(5) Slowly advance the thrust lever to takeoff thrust. For the takeoff thrust target, see Testing-09, Task 71-00-00-760-020, Task 71-00-00-760-060, Task 71-00-00-760-061 or Task 71-00-00-760-063, Thrust Power Setting Curve, Figure 1304 and use Band A.

(6) Let the engine become stable for 3 minutes and make a record of the engine parameters.

(7) Set the throttle stop for TAKEOFF at this thrust lever position.

(8) Slowly retard thrust lever to idle position and stabilize for five minutes.

(9) Test engine acceleration/deceleration in primary EPR mode as follows, if required:

NOTE: Prior to snap accelerations the engine must be stabilized for 15 minutes at the MINIMUM or APPROACH IDLE position.

(a) Select APPROACH IDLE. Check that idle speed increases to +/− 0.5% (N2) of APPROACH IDLE target.

(b) Verify the EEC is operating in the EPR mode. Snap accelerate (one second or less for thrust lever movement) from APPROACH IDLE to the TLRA stop for takeoff thrust, (that you set before). Record the elapsed time from initiation of the TLRA movement to 90 percent of takeoff thrust target. (See Testing−09, Thrust Power Setting Curve, Figure 1304. Use 90 percent of the lower line of Band A for the 90 percent takeoff thrust target). Continuously monitor thrust and EGT. Thrust and EGT must not exceed the values shown in Table 1301.

MODEL	JET THRUST − LBS (N)	EGT − °C (TT4.95)
PW4152	53000 (235755)	644° C
PW4156A	57000 (253547)	654° C
PW4158	59000 (262444)	654° C

Maximum Observed EGT (TT4.95)
Table 1301

(c) The acceleration time shall not exceed 6.5 seconds. Stabilize for 50 − 55 seconds prior to continuing.

(d) Record engine parameters.

(e) Select MINIMUM IDLE mode.

(f) For PW4152 Model: Snap (one second or less thrust lever movement) decelerate to MINIMUM IDLE. Record the elapsed time from initiation of the thrust lever movement to 25 percent FN/ST2 of the lower line of A Band of Figure 1304 in 71-00-00 Testing-09. Document the deceleration time on final log. The deceleration time shall not exceed 5.5 seconds for the thrust change.

(g) For PW4156A Model: Snap (one second or less thrust lever movement) decelerate to MINIMUM IDLE. Record the elapsed time from initiation of the thrust lever movement to 25 percent FN/ST2 of the lower line of A Band of Figure 1304 in 71-00-00 Testing-09. Document the deceleration time on final log. The deceleration time shall not exceed 5.5 seconds for the thrust change.

(h) For PW4158 Model: Snap (one second or less thrust lever movement) decelerate to MINIMUM IDLE. Record the elapsed time from initiation of the thrust lever movement to 25 percent FN/ST2 of the lower line of A Band of Figure 1304 in 71-00-00 Testing-09. Document the deceleration time on final log. The deceleration time shall not exceed 5.5 seconds for the thrust change.

(i) Check that engine stabilizes at MINIMUM IDLE.

(10) Do a engine shutdown by the Normal Shutdown Procedure, Task 71-00-00-760-005.

Task 71-00-00-760-033:

1. Test No. 5 - Oil System Static Leak Test

A. General

(1) Use this procedure to check the engine oil system for leaks when the engine is not operated (static). The oil system is pressurized with air pressure at the gearbox deoiler for this test.

(2) The static leak test consists of pressurizing the gearbox with air through an external fitting adapted to the gearbox breather vent tube, and checking for leaks. 10 psig (68.9 kPa) of internal pressure is sufficient to determine leakage. Higher pressure may unseat carbon seals in main shaft bearing compartments which are connected to the gearbox via shaft housings or oil lines.

B. Equipment And Materials Necessary

Standard Tools:

(1) A regulated air supply source that can supply air pressure at 10 psig (68.9 kPa).

(2) Air hose and fittings to connect air supply to the adapter on the deoiler vent duct.

(3) One pint plastic bottle (or equivalent) of water.

(4) A short length of rubber hose to fit in the accessory seal drain tubes.

(5) A fluid drain collector/container (capacity 5 US gal (18.93 liter).

Special Tools:

PWA 85844	Adapter
PWA 107038	Adapter, Vacuum/Leak Check (Gearbox Breather), (Optional to PWA 85844)

R
R

Consumable Materials:

Item No.	Designation
P05-007	Leak Check Fluid
P05-068	Nitrogen (PMC 2214)

C. Procedure

R (1) To install the PWA 85844 Adapter do as follows:

R (a) Remove rear portion of deoiler vent duct.

R (b) Install PWA 85844 Adapter and air line at tube coupling on remaining portion of deoiler vent duct.

R (2) To install the optional PWA 107038 Adapter do as
R follows: See Figure 1301.

R (a) Install the clamp assembly on the round section,
R near the end of the deoiler vent duct.

R (b) Put the base assembly on the end of the deoiler
R vent duct.

R (c) Align the slots in the clamp assembly with the two
R eyebolts.

R (d) Install the eyebolts in to the clamp assembly and
R tighten with the two knurled knobs.

R (e) Tighten the knurled knob on the clamp assembly.

R (f) Cap one end fitting and attach filtered shop air
R to the other fitting.

CAUTION: DO NOT EXCEED 10 PSIG (68.9 kPa) PRESSURE IN GEARBOX OR 325°F (163°C) TEMPERATURE IN GEARBOX. DO NOT MOTOR ENGINE DURING TEST. MOTORING ENGINE WHILE OIL SYSTEM IS PRESSURIZED WILL CAUSE OIL CONTAMINATION OF COMPRESSORS AND GASPATH.

R (3) Apply and keep 10 psig (68.9 kPa) regulated pressure in the gearbox. Use a clean dry air supply with a temperature less than 325°F (160°C) or Nitrogen P05-068. Monitor pressure indication to prevent exceeding 10 psig (68.9 kPa) in gearbox.

NOTE: Pressure of less than 7 psig (48.3 kPa) is insufficient to provide adequate results.

R (4) With Leak Check Fluid P05-007 check for leaks at following places:

(a) All gearbox pad seals without overboard drains.

(b) All connections to deoiler.

(c) All gearbox, angle gearbox, and lay shaft connections.

(d) All gearbox housing covers and fittings.

(e) All oil supply lines from oil pump to bearing compartments.

R (5) Connect hose to each gearbox pressure test fitting (four places) in the Drain Manifold/Test Box and immerse free end in pint bottle of water. Some leakage may be expected. In this case it would be possible to slowly count the number of air bubbles. Any seal which leaks sufficient air to vigorously agitate water is unsatisfactory.

R (6) Release pressure from gearbox.

R (7) Repair leaks and retest as necessary.

R (8) Remove the PWA 85844 Adapter or PWA 107038 Adapter and
R air line.

R (9) If removed, reinstall rear portion of deoiler vent
R duct.

Task 71−00−00−760−037:

1. Test No. 6 − Electronic Engine Control (EEC) Idle Test

A. Prerequisites

(1) Do a static operation check of the EEC, Testing−07, Task 71−00−00−760−038 before you start the engine.

B. Equipment And Tools Necessary − None

C. General

(1) Use this procedure to check for the satisfactory operation of the EEC with the engine at idle power.

(2) You can do this test at the same time that you do Test No. 3 − Idle Power Test, Task 71−00−00−760−030.

(3) Following Electronic Engine Control (EEC) outputs should be monitored during all engine testing:

(a) Analog outputs − Low Rotor Speed, N1

1 Minimum Load Impedance − 10 kilohms

2 Signal Source − Magnetic speed pickup through EEC buffer circuit

3 Source Impedance − Less than 150 ohms series resistance
− Less than 100pf shunt capcitance

4 Open Circuit Voltage − 2.0 volt minimum at 200 rpm
− 25 volts at 4400 rpm

5 Frequency to rpm − N1 speed (rpm) = frequency (HZ)

(b) Analog outputs − High Rotor Speed, N2

1 Minimum Load Impedance − 10 kilohms

2 Signal Source − Electrically independent winding on the EEC alternator

3 Source Impedance − 1,000 − 50. ohms

4 Minimum Voltage Range - 5 volts (peak to peak) at 10 percent N2
- 85 volts (peak to peak) at 106 percent N2

5 Frequency to rpm - N2 rpm = 2.837219 x frequency (HZ)

D. Procedure

(1) Start the engine by the Engine Start Procedure (Normal), Task 71-00-00-760-004.

(2) Make sure all the engine parameters are in the permitted limits.

(3) Let the engine become stable for three minutes at MINIMUM IDLE.

(4) Check each channel of the EEC display panel to make sure that a signal is sent for N1, N2, EGT, WF, TRA, SVA, P2 probe and T2 probe.

(5) Do an engine shutdown by the Normal Shutdown Procedure, Task 71-00-00-760-005.

(6) Record maintenance words (Labels 350, 351, 352, 353 and 354 - both channels) which are deposited in EEC interface (EEROM). Decode recorded maintenance words to examine faults which may exist. Refer to 71-00-00, Fault Isolation-00, Task 71-00-00-810-001.

(7) Use the record of fault messages to do any maintenance that is necessary. Refer to 71-00-00, Fault Isolation-00, Task 71-00-00-810-001 for proper procedure and corrective action.

Task 71-00-00-760-038:

1. Test No. 7 - ELECTRONIC Engine Control (EEC) Static Test

A. General

(1) Use the EEC static test to check that the EEC operates correctly before you start the engine. This test will do a self diagnostic check of the EEC. It will also check the torque motor, solenoid and position feedback circuits.

B. Equipment And Tools Necessary - None

C. Procedure

(1) Turn the test cell electrical power to: ON.

(2) Turn the ground electrical power to the EEC to: ON.

(3) Record maintenance words which are deposited in EEC interface. (Labels 350, 351, 352, 353 and 354 - both channels).

(4) Decode recorded maintenance messages to identify faults which may exist. Refer to 71-00-00, Fault Isolation-00, Task 71-00-00-810-001 for proper procedure and corrective action.

CAUTION: MAKE SURE YOU TURN OFF THE GROUND POWER TO THE EEC WHEN THE TEST IS COMPLETED. FAILURE TO TURN OFF GROUND TEST POWER WILL UNNECESSARILY CONSUME EEC OPERATIONAL LIFE.

(5) Turn the ground electrical power to the EEC to: OFF.

(6) Turn the electrical power to the test cell to: OFF.

(7) Use the record of fault messages to do any maintenance that is necessary.

Previous Pageblock Return to Previous Menu Next Pageblock

Task 71-00-00-760-032:

1. Test No. 8 - Engine Vibration Survey

A. General

(1) Use this procedure to check for satisfactory engine vibration from idle power to TAKEOFF power. The vibration is checked for both the acceleration and deceleration operation.

(2) The engine must be thermally stable before you do the vibration survey test. You must do the test steps in the sequence shown to get the engine thermally stable.

B. Procedure

(1) Start the engine by the Engine Start Procedure (Normal) Task 71-00-00-760-004. See 71-00-00 Power Plant General - Testing-00.

(2) Let the engine become stable for five minutes at MINIMUM IDLE.

(3) Make sure all the engine parameters are in the permitted limits and that there are no leaks .

(a) Record N1, N2, vibration, oil pressure and oil temperature.

CAUTION: IF THE ENGINE DOES A SURGE DURING THIS TEST, YOU MUST MOVE THE THRUST LEVER TO MINIMUM IDLE WITH IN ONE SECOND OF THE SURGE. OPERATE THE ENGINE AT MINIMUM IDLE FOR FIVE MINUTES IF THERE IS NO EGT OVERTEMPERATURE. IF THERE IS AN EGT OVERTEMPERATURE, DO AN EMERGENCY SHUTDOWN AND MOTOR THE ENGINE UNTIL THE EGT IS LESS THAN 180 °C.

(4) Slowly move the thrust lever forward to 1.3 EPR and let the engine become stable for 10 minutes.

(5) Move the thrust lever back to MINIMUM IDLE power and let the engine become stable for 5 minutes.

(6) Survey engine vibration by making a slow acceleration at uniform rate from stabilized MINIMUM IDLE to the maximum take off power rating and a slow deceleration at a uniform rate from the maximum take off power

rating to MINIMUM IDLE. Duration of transients should be 90 seconds or greater.

NOTE: During the acceleration and deceleration, the engine vibration will go to one or more vibration peaks. Be prepared to make a record of the N1 and N2 speeds when these vibration peaks occur.

(7) At each speed where peaks have shown during acceleration and deceleration, record the mean vibration level of each pickup after 30 second stabilization.

(8) Slowly move the thrust lever to the IDLE position and operate the engine for 5 minutes.

(9) Do an engine shutdown by the Normal Shutdown Procedure, Task 71-00-00-760-005. See 71-00-00 Power Plant General - Testing-00.

(10) Check the engine vibration levels during this test to make sure that the allowable limits are not exceeded. See 71-00-00, Testing-00, Engine Operation Limits, Task 71-00-00-990-007, Vibration Limits

(11) For engines that exceed the vibration limits, see 71-00-00, Testing-19, Trim Balance, Task 71-00-00-760-043, Task 71-00-00-760-052 or Task 71-00-00-760-057.

Task 71-00-00-760-020:

1. Test No. 9 - Engine Acceptance Test

A. Prerequisite Procedure

CAUTION: ENGINE CONFIGURATION IDENTIFIER MUST BE CAREFULLY DETERMINED. FAILURE TO CORRECTLY IDENTIFY CONFIGURATION COULD RESULT IN RED LINE EXCEEDANCE AND/OR THRUST SHORTFALL

(1) Use Table 1301 to get the necessary Testing-09 configuration. Get the engine configuration from the engine identification data plate. Look for a configuration identification suffix marked after the engine model in the model field.

(a) EXAMPLE 1:

1 If "PW4158 (-3)" is marked on the engine identification plate, the configuration identifier suffix is "(-3)". This corresponds to a Phase 3 configuration as specified in Table 1301. Use TESTING-09, CONFIG-2 to do the acceptance test.

(b) EXAMPLE 2:

1 If "PW4158" is marked on the engine identification plate with no configuration identifier suffix, the configuration is Pre Phase 3 as specified in Table 1301. Use TESTING-09, CONFIG-1 to do the acceptance test.

TESTING-09 CONFIGURATION	ENGINE CONFIGURATION	CONFIGURATION IDENTIFICATION SUFFIX
Config-1	Pre Phase 3	None
Config-2	Phase 3 (Reference SB PW4ENG 72-572)	(-3)
Config-3	Intermix (-1C or -1E) (Reference SB PW4ENG 72-516)	(-1C/-1E)
Config-4	NOT AVAILABLE for Airbus installations	

TESTING-09 CONFIG/ENGINE CONFIGURATION
Table 1301

TESTING-09 CONFIGURATION	ENGINE CONFIGURATION	CONFIGURATION IDENTIFICATION SUFFIX
Config-5	Intermix (-3A) (Reference SB PW4ENG 73-150)	(-3A)

TESTING-09 CONFIG/ENGINE CONFIGURATION
Table 1301 (Continued)

(2) Use this procedure to test the engine for satisfactory performance after one or more components or modules have been replaced or repaired. This test is also used after the engine was fully disassembled, repaired and assembled.

NOTE: It is recommended that you not install large quantities of blended blades, vanes and airseals in one engine. If these parts are blended to the maximum limits in many areas, the result will be low engine performance.

(3) It is possible that other tests are necessary before you do this test, see 71-00-00 Power Plant General - Testing-00, Test Requirements After Engine/Module/Component Repair or Replacement, Task 71-00-00-990-003. This procedure will also give the sequence for the necessary tests.

(4) Special instrumentation must be installed on the engine before the engine is operated for this test.

(5) The engine testing must be done in a test configuration and test cell that has been calibrated. Calibrate to the specifications shown in P&W Publication Report No. 544. All test data must be corrected to the special test cell correction factors before you use the limits and curves in this procedure.

(6) For general safety information, see 71-00-00, Power Plant General - Testing-00, Engine Safety Precautions, Task 71-00-00-990-004.

(7) For safe engine operation, see 71-00-00, Power Plant General - Testing-00, Precautions And Procedures For Safe And Correct Engine Operation, Task 71-00-00-760-002.

(8) For engine operation limits, see 71−00−00, Power Plant General − Testing−00, Engine Operation Limits, Task 71−00−00−990−007.

B. Equipment And Materials Necessary

Standard Tools (See 71−00−00, Power Plant General − Testing−00, Prepare The Engine For Test In A Cell, Task 71−00−00−480−001

(1) Fuel pump drain hose and collection bottle.

(2) Stator vane drain hose and collection bottle.

(3) Station 2.5 compressor bleed actuator drain hose and collection bottle.

(4) Air/oil cooler modulating valve drain hose and collection bottle.

(5) IDG air/oil cooler modulating valve drain hose and collection bottle.

(6) TCC actuator modulating valve drain hose and collection bottle.

(7) Accessory drive fluid power pump drain hose and collection bottle.

(8) Starter drive drain hose and collection bottle.

(9) IDG drain hose and collection bottle.

(10) Accessory drive EEC generator seal drain hose and collection bottle.

(11) Fuel/oil heat exchanger IDGS core drain hose and collection bottle.

(12) Fuel/oil heat exchanger engine oil core drain hose and collection bottle.

(13) Fuel/oil heat exchanger IDG center tube drain hose and collection bottle.

(14) Bypass valve drain hose and collection bottle.

(15) Hydraulic pump drain hose and collection bottle.

C. Test Instrumentation And Test Cell Connections.
Install the special instrumentation and equipment that follows:

(1) PT2 and PS2 (8 locations) − (optional)

(2) PT2/TT2 Rosemount probe − (PWA 85523)

(3) TT2 − Compressor inlet total temperature (8 locations)

(4) Fuel flow (observed)

(5) T Fuel

(6) N1 RPM − (NL)

(7) N2 RPM − (NH)

(8) PT2.5*

(9) PS3

(10) PS4I (Optional)

(11) PT4.95

(12) Main Oil Pressure

(13) Main Oil Temperature

(14) Oil Filter Differential Pressure

(15) Fuel Pump Inlet Pressure

(16) Fuel Pump Pressure

(17) PAMB

(18) TT2.5*

(19) TT3*

(20) Vibration, fan case flange A (vertical)

(21) TT4.95 Harness Average (stand reading) If EEC T49 value is used, adjustment to T4.95 (real without shunt) must be made.

(22) Thrust − (observed)

(23) Thrust Lever and Fuel Select Switch

(24) Ignition Switch

(25) Test Cell Fuel Supply Pressure

(26) ARINC 429 transceiver.

(27) No. 3 Bearing Compartment Breather Pressure

* - A necessary parameter for the module analysis program MAPNET System. Optional unless a MAPNET System analysis is necessary.

D. Thrust Rating and Operation Limits

(1) Ratings at static sea level standard conditions are shown in Table 1302.

ENGINE MODEL	THRUST SETTING	JET THRUST LBS. (N)	TSFC *
PW4152	TAKEOFF	51300 (228194)	0.3384
PW4152	MAX CONTINUOUS	47160 (209778)	0.3318
PW4152	90% MAX CONTINUOUS	42450 (188827)	0.3258
PW4152	70% MAX CONTINUOUS	34200 (152129)	0.3198
PW4156A	TAKEOFF	56440 (251058)	0.3519
PW4156A	90% TAKEOFF	51000 (226859)	0.3398
PW4156A	MAX CONTINUOUS	45790 (203684)	0.3308
PW4156A	90% MAX CONTINUOUS	40940 (182110)	0.3247
PW4158	TAKEOFF	57990 (257952)	0.3567
PW4158	88% TAKEOFF	51000 (226859)	0.3405
PW4158	MAX CONTINUOUS	45490 (202349)	0.3307
PW4158	90% MAX CONTINUOUS	40770 (181354)	0.3242

*NOTE: TSFC (Thrust Specific Fuel Consumption) is for reference only for a new engine and is not necessary for the engine Acceptance Test.

THRUST AND TSFC RATINGS AT SEAL LEVEL STANDARD CONDITIONS
Table 1302

(2) The engine speed limits are shown in 71-00-00, Power Plant General - Testing-00, Engine Operation Limits, Task 71-00-00-990-007.

(3) The engine exhaust gas temperature (EGT) limits for Station 4.9 are shown in 71−00−00, Power Plant General − Testing−00, Engine Operation Limits, Task 71−00−00−990−007.

E. Seal Drain Leakage Limits

(1) During the Acceptance Test, the seal leakage must be measured. See 71−00−00, Power Plant General − Testing−00, Engine Operation Limits, Task 71−00−00−990−007.

(2) Attach a hose to each seal drain connection and put the other end of the hose in a collection bottle. Each bottle must be identified.

F. Multi−Point Instrumentation

(1) Multi−point instrumentation is necessary and is measured during the acceptance test for some parameters. To get satisfactory data, there is a limit for sampling points that do not operate. The necessary multi−point instrumentation and points that do not operate are listed as follows:

(a) TT2 − Eight sampling points are necessary with a maximum limit of two points that do not operate.

(b) Bellmouth pitot static probes (PT2 and PS2) − This parameter is optional. If it is used, eight sampling points are necessary with a maximum limit of two points that do not operate.

(c) Pitot static probes must be installed for test cell correlation testing. See the specifications shown in P&W publication Report No. 544.

(d) PT2 can be calculated for post test cell correlation testing without pitot static probes. Do a correlation of PT2 (pitot static) to: PT2 Rosemount probe, P cell or (PT2/Pamb vs N1 corrected).

G. Acceptance Test General Specifications

(1) Use the definitions that follow during the acceptance test.

(a) EPR−0 = Engine Pressure Ratio from the EEC (Electronic Engine Control) instrumentation system with a zero delta EPR modified (Class 09) Engine Program Plug (EPP) installed in the Electronic Engine Control (EEC).

OR

EPR−0 can be calculated by adding the necessary EPR Modification (delta EPR) used during the test run to the EPR output from the Engine Control (Engine Electronic Control EPR therefore EECEPR).

In the Airbus Engine Control logic EPR modification (delta EPR) is a function of TRA (throttle lever resolver angle). To correctly calculate EPR−0 from EECEPR, EPR class and TRA are necessary.

The Control logic removes the EPR modification (delta EPR) at low power to align the right and left wing engines. This logic is unique to Airbus installations and controls because it occurs in sea level test range, (below "C" band point when the TRA is less than 72 degrees).

Calculation of EPR−0. Because the recommended test configuration is with a class 16/ −0.028 delta EPR modifier, the calculation is shown as follows:

EECEPR = EPR−028

If TRA is equal or greater than 72 degrees,
EPR−0 = EPR−028 + .028

If TRA is between 40.5 and 72 degrees,
EPR−0 = EPR−028 + (1−(72−TRA)/31.5) x .028

If TRA is equal or less than 40.5 degrees,
EPR−0 = EPR−028

For other EPR class modifiers (other than class 16), see Table 1303 for values.

(b) EPR−028 = Engine Pressure Ratio form the EEC (Electronic Engine Control) instrumentation system with a Class 16 (−0.028 delta) EPR modifier Engine Programming Plug (EPP) installed in the EEC.

(c) EPR = Engine Pressure Ratio From the EEC (Electronic Engine Control) instrumentation system with a class EEC programming plug to be calculated. To calculate EPR, (EPR−0 + delta EPR modifier). EPR is the value used in Paragraph Q. Check For Engine Acceptance to check for engine acceptance and to calculate engine margin to the limits.

(d) TRA = Throttle Resolver Angle, position of the EEC thrust control lever as specified by the electrical signal from the EEC.

EPR CLASS	EPR MODIFICATION (DELTA EPR)
01	+ .032
02	+ .028
03	+ .024
04	+ .020
05	+ .016
06	+ .012
07	+ .008
08	+ .004
09	0.0
10	− .004
11	− .008
12	− .012
13	− .016
14	− .020
15	− .024
16	− .028

EEC PROGRAMMING PLUG (EPP) CLASSIFICATION
Table 1303

(2) All Acceptance Test specifications are from the test cell instrumentation except the EPR (Engine Pressure Ratio) which is the EPR value from the EEC. The EEC values for Tt2, N1, N2 can be used if it is shown they are consistent and equal to the stand readings. This must be done during the test cell correlation testing. The EEC values must be within the limits and tolerances of 71−00−00 Testing−00 Table 1305 of Test Instrumentation Calibration (Task 71−00−00−990−002).

Any exceptions to this rule will be specified in the test procedure or correction to the observed section.

CAUTION: IF YOU USE AN INCORRECT EPP PLUG DURING ENGINE TEST, YOU WILL CAUSE ERRORS IN SETTING THE EPR RATING CLASSIFICATION AND IN DETERMINING ENGINE ACCEPTANCE TO LIMITS OF PARAGRAPHS Q. AND R. RESPECTIVELY.

(3) For standardization for all PW4000 engine models and to make sure that the engine will make Takeoff thrust, it is recommended that the Acceptance Testing be done with a class 16 EEC Programming Plug (EPP) installed in the EEC. Refer to SB PW4ENG 73−203 for EEC Programming Plug (EPP) part number for testing.

(4) After the Acceptance Test, the necessary class and part number of EEC programming plug must be selected. You must calculate the necessary class and get the part number from SB PW4ENG 73−203. After you select the necessary EEC programming plug, install it in the EEC. See the Component Maintenance Manual (CMM), − EEC Data Entry Plug, PN 50A450. This manual has the procedure for setting the plug classification.

(5) The EEC has logic for operation in two modes:

(a) EPR = This is the primary mode.

(b) N1 = This is the alternate mode which is the backup mode (default) for the EPR mode.

(c) The Acceptance Test must be done in the EPR mode.

PW4158 ENGINES EEC PROGRAMMING PLUG PART NUMBER VERSUS SVS CORRECTION REQUIREMENTS
Table 1306

H. Procedures To Prepare For Test

(1) Check that all the test instrumentation is calibrated and that there are no leaks.

(2) Service the engine oil system as shown in the procedures of 72-00-00 Servicing-02 (Task 72-00-00-610-002) or 72-00-00 Servicing-03 (Task 72-00-00-610-003).

(3) Prime the engine. See 71-00-00 Power Plant General-00, Oil and Fuel Systems Priming Procedure, (Task 71-00-00-760-003).

(4) Do the EEC static test. See 71-00-00 Test No. 7 - EEC Static Test, (Task 71-00-00-760-038).

I. Testing Prior to Acceptance Test

(1) Do the EEC idle test. See 71-00-00 Test No. 6 - EEC Idle Test, (Task 71-00-00-760-037).

NOTE: Start the engine with one Igniter A only.

(2) Do the idle leak test. See 71-00-00 Test No. 3 - Idle Power Test, (Task 71-00-00-760-030). Check for leaks, if necessary do an engine shutdown and repair any leaks.

NOTE: You can do Test No. 6 and at the same time.

(3) Let the engine become stable for five minutes at MINIMUM IDLE.

(4) Make sure all the engine parameters are in the permitted limits. See Power Plant General - Testing-00, Engine Operation Limits, (Task 71-00-00-990-007).

(a) Make sure that the main oil pressure is in limits. The oil pressure must also be in the acceptance band shown in 71-00-00, Test No. 13, (Task 71-00-00-760-047).

(b) Make sure that the No. 1 - 2 bearing compartment breather pressure is in limits.

(c) Make sure that the No. 3 bearing compartment breather pressure is in limits.

(d) Make sure that the No. 3 bearing compartment scavenge temperature (T3 SCAV) is in limits.

(e) If the optional PS4I instrumentation is installed, make sure that the turbine cooling air pressure ratio (TCAR) is in the operator's historical range.

NOTE: The turbine cooling air ratio (TCAR) check is removed from all PW4000 engine manuals. Field experience shows that the assembly instructions and TOBI flow checks are sufficient to make sure that the engine will operate correctly. You must obey the assembly and check procedures specified in the engine manual and service bulletins.

(5) Make a record of N1 RPM, N2 RPM, T4.95 (EGT), oil pressure and temperature. Check the EEC for fault messages.

NOTE: It is recommended that a complete set of data be taken at this time to check the data system. The data system must be checked before the Engine Acceptance Test.

(6) Do an engine shutdown by the Normal Shutdown Procedure, (Task 71-00-00-760-005).

(7) Check the EEC status for fault messages. Do any maintenance that is necessary.

(8) Between 5 and 35 minutes after shutdown, fill the oil tank manually as shown in the procedures of 72-00-00 Servicing-02 (Task 72-00-00-610-002) or 72-00-00 Servicing-03 (Task 72-00-00-610-003). This oil fill step will be used to calculate the engine oil consumption. The oil consumption will be calculated in gallons per hour after the Acceptance Test.

NOTE: Do not use a remote engine oil fill system during the Acceptance Test. You must not add engine oil during the Acceptance Test.

J. Acceptance Test Data Records

(1) Make a record on the engine log sheet of the general information and data as follows:

(a) Date of the Acceptance Test.

(b) Engine serial number.

(c) Serial number of modules and major components.

(d) Fuel grade and specific gravity.

(e) Engine oil specification and brand.

(f) Ambient atmospheric conditions (true barometer, wet and dry bulb temperatures).

(g) Total time of the Acceptance Test.

(h) Reasons for any engine shutdowns that are not on the schedule.

(i) Any repairs that were necessary during the Acceptance Test.

(j) If it is applicable, the reason the engine was rejected after the Acceptance Test.

(k) The test operator must sign the engine log.

(l) The test inspector must sign the log.

(2) Make a record of the engine parameters shown in Paragraph C. "Test Instrumentation And Test Cell Connections", during the Acceptance Test. Make a record at each thrust lever position during the test, (except oil consumption).

K. Initial Running

NOTE: The INITIAL RUNNING is for the LPC/HPC break−in cycle and is only necessary if the LPC or HPC or both were replaced, repaired or are new. If the LPC/HPC break−in cycle is not necessary, go to the next testing step, Engine Acceptance Test.

(1) Start the engine by the Engine Start Procedure (Normal), (Task 71−00−00−760−004). Start engine using Igniter B. Determine and record overall time from pressurization until MINIMUM IDLE speed is reached. Record data after five minutes at MINIMUM IDLE.

(a) Record data for all stabilized test points prior to moving thrust lever to the next requirement.

(b) Verify that the main oil pressure and the No. 3 bearing compartment breather pressure are within the limits shown under Testing-00, Operating Limits, (Task 71-00-00-990-007).

(c) If the optional PS4I instrumentation is installed, make sure that the turbine cooling air pressure ratio (TCAR) is in the operator's historical range.

(d) Check EEC status and maintenance words for faults. See 71-00-00, Fault Isolation-00 (Task 71-00-00-810-001).

(2) The acceleration in this section is to be done with reverse TRA. Verify in simulated deployed position that the 2.5 bleed is 100 percent open (88 percent of actuator stroke) throughout reverse operation.

CAUTION: IF AN ENGINE STALL OCCURS DURING THIS TEST, YOU MUST MOVE THE THRUST LEVER TO MINIMUM IDLE WITHIN ONE SECOND OF THE STALL. DO THE PROCEDURES SHOWN IN TESTING-00 "PROCEDURE AFTER ENGINE SURGE OR STALL" (TASK 71-00-00-760-009) AND DO THE "START PROCEDURE AFTER AN EMERGENCY SHUTDOWN" (TASK 71-00-00-760-006). IF YOU DO NOT DO THESE PROCEDURES, YOU CAN DAMAGE THE TURBINE TIP SEALS.

(a) Make a slow acceleration (30 - 60 seconds) to 8000 N2. Stabilize for two minutes at 8000 N2. Record data at the end of the stabilization period.

(b) Continue slow acceleration to 8500 N2. Stabilize for two minutes at 8500 N2. Record data at the end of the stabilization period.

(c) Continue slow acceleration to 8800 N2. Stabilize for two minutes at 8800 N2. Record data at the end of the stabilization period.

(d) Continue slow acceleration to 9000 N2. Stabilize for two minutes at 9000 N2. Record data at the end of the stabilization period.

NOTE: At cold inlet temperature maximum reverse scheduling (fN1C), may restrict the engine from achieving 9000 rpm target.

(e) Continue slow acceleration to max reverse TRA. Stabilize for five minutes at fixed TRA. Record data at the end of the stabilization period.

NOTE: At low inlet temperatures, high N2 speeds may result in high thrusts. DO NOT EXCEED 50000 LBS FN/ST2.

(f) Make a slow deceleration (30 - 60 seconds) to MINIMUM IDLE. Stabilize at MINIMUM IDLE for 0 - 30 seconds. Take the engine out of the simulated reverse position.

(g) Continue normal acceptance running.

L. Engine Acceptance Test (to be run following initial break in running for refurbished engines and all other engines).

(1) The Acceptance Testing-09 cycle is shown in the Engine Run Schedule, Figure 1301.

(2) Start the engine by the Engine Start Procedure (Normal), (Task 71-00-00-760-004).

NOTE: Start the engine with one Igniter B only.

NOTE: Monitor the main oil pressure, (MOP), during the start procedure. If you do not see any oil pressure, you must immediately and quickly stop the start procedure.

(3) Make a record of the time from fuel pressurization to MINIMUM IDLE speed.

(4) Let the engine become stable at MINIMUM IDLE.

(5) Make sure all the engine parameters are in the permitted limits. See Power Plant General - Testing-00, Engine Operation Limits, (Task 71-00-00-990-007).

(6) Operate the engine at MINIMUM IDLE for five minutes.

(7) If the optional PS4I instrumentation is installed, make sure that the turbine cooling air pressure ratio (TCAR) is in the operator's historical range.

(8) Check EEC status and maintenance words for faults. See 71-00-00, Fault Isolation-00 (Task 71-00-00-810-001).

(9) Continue slow acceleration (90 - 120 seconds) from MINIMUM IDLE to the thrust of Band A shown in Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3). Stabilize for three minutes. Record data and install TRA stop.

(10) Do the decel vibration survey as follows.

CAUTION: IF AN ENGINE STALL OCCURS DURING THIS TEST, YOU MUST MOVE THE THRUST LEVER TO MINIMUM IDLE WITHIN ONE SECOND OF THE STALL. DO THE PROCEDURES SHOWN IN TESTING-00 "PROCEDURE AFTER ENGINE SURGE OR STALL" (TASK 71-00-00-760-009) AND DO THE "START PROCEDURE AFTER AN EMERGENCY SHUTDOWN" (TASK 71-00-00-760-006). IF YOU DO NOT DO THESE PROCEDURES, YOU CAN DAMAGE THE TURBINE TIP SEALS.

(a) Make a slow deceleration (60 - 120 seconds) to MINIMUM IDLE, surveying engine vibration.

(b) At each speed where peaks have shown during the deceleration, record the mean vibration level of each pickup after 30 second stabilization.

(c) Check that the engine vibration values are in the permitted limits. See Testing-00, Engine Operation Limits, (Task 71-00-00-990-007).

(d) For engines that are more than the permitted vibration limits, do Testing-19, Trim Balance Procedure And Test, (Task 71-00-00-760-043), (Task 71-00-00-760-052) or (Task 71-00-00-760-057).

(11) Select APPROACH IDLE. Stabilize for 15 minutes. At the end of the stabilization period, record data.

(12) Do the snap acceleration/deceleration test cycle shown in 71-00-00, Testing-04 (Task 71-00-00-760-031) and perform step B.(9)(b) through B.(9)(i) for acceleration/deceleration test). Also see Engine Run Schedule shown in Figure 1301.

NOTE: The snap acceleration/deceleration must be done after the compressor break in cycle shown in above.

(13) Vibration Survey (Acceleration).

(a) An engine vibration survey shall be conducted on an engine that has been thermally stabilized. Completion of step M.(12) above without shutdown will result in a stabilized engine. If shutdown occurs, the engine must be run at thrust Band C, Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3) or higher for three minutes and then run for six minutes at MINIMUM IDLE prior to conducting the vibration survey.

(b) Make a slow acceleration (90 - 120 seconds) from MINIMUM IDLE to thrust Band A Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3).

(c) At each speed where peaks have shown during the acceleration, record the mean vibration level of each pickup after 30 second stabilization.

(d) Check the engine vibration levels during this test to make sure that the allowable limits are not exceeded. See 71-00-00, Testing-00, Vibration Limits, (Task 71-00-00-990-007).

(e) For engines that exceed the vibration limits, see 71-00-00, Testing-19, (Task 71-00-00-760-043), (Task 71-00-00-760-052) or (Task 71-00-00-760-057).

(14) Performance Calibration.

(a) Stabilize at thrust Band A Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3) for five minutes. At the end of the stabilization period, record data.

(b) Stabilize at thrust Band B Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3) for three minutes. At the end of the stabilization period, record data.

(c) Stabilize at thrust Band C Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3) for three minutes. At the end of the stabilization period, record data.

(d) Stabilize at thrust Band D Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3) for three minutes. At the end of the stabilization period, record data.

(e) Decelerate slowly (60 - 120 seconds) to APPROACH IDLE. Stabilize for 20 minutes.

(15) Engine shutdown procedure.

(a) Do an engine shutdown by the Normal Shutdown Procedure, (Task 71-00-00-760-005).

(b) Check the EEC status for fault messages. Do any maintenance that is necessary.

M. Procedures After Engine Shutdown - Corrections Of Observed Readings

(1) Correct the observed data collected in thrust Bands A, B, C, and D of the performance calibration. Use the procedure defined in Figure 1302 (Sheet 1), Figure 1302 (Sheet 2), Figure 1302 (Sheet 3) and Figure 1302 (Sheet 4).

N. Engine Configuration Determination

(1) Based on the engine configuration identifier suffix in Table 1301, make sure that you are in the appropriate Testing-09 CONFIG section to use to class and check the engine for acceptance.

O. Check Corrected Data

(1) If the optional PS4I instrumentation is installed, make sure that the turbine cooling air pressure ratio (TCAR) is in the operator's historical range.

(2) Values of Corrected Net Thrust versus PT4.95/PT2 corrected N1, corrected N2, and corrected EGT, should fall within the requirements of Figure 1309 (Sheet 1), Figure 1309 (Sheet 2), Figure 1309 (Sheet 3), and Figure 1309 (Sheet 4). The lines on these figures are guidelines only and are not acceptance limits. Points outside these values can suggest that there is a instrumentation and/or other problem that must be identified.

(a) Definitions of terms used in Figure 1309 are as follows:

(b) Complete Refurbishment: Bands are for engines that had all modules repaired or replaced to new engine clearances and airfoil condition.

(c) Minor or No Refurbishment: Bands are for high time service engines that are fully deteriorated without any or only a small quantity of gaspath repair.

(3) Values of corrected PT2.5/PT2 and PS3/PT2.5 versus PT4.95/PT2 should fall within the guidelines of Figure 1309 (Sheet 5) and Figure 1309 (Sheet 6). The lines of these figures are guidelines only and not acceptance limits. Points outside these values can suggest that there is a instrumentation and/or other problem that must be identified.

(4) If a review of the test high power (points generally above 52000 lbf (231307.5 N) thrust, or 1.45 PT4.95/PT2) indicate a change in level relative to the check line shape as shown in Table 1307 below, this can be an indication of abnormal fan operation. This abnormal operation is also accompanied by a noticeable tone change in the engine. This change is triggered at high power by dirty and/or severely eroded fan blade leading edges. Corrective action must be taken. Refer to 72−00−31, Repair−01 (Task 72−00−31−300−001).

(5) Corrected Thrust Specific Fuel Consumption (TSFC) must be compared with the values listed in Table 1302. These values are included for reference to new engine levels only and are not intended as an acceptance requirement.

ABNORMAL FAN OPERATION		
Delta P4.95/PT2	approximately +0.015 to 0.020	at Fn = K
Delta N1C	approximately +80 to +100 RPM	at Fn = K
Delta N2C	approximately −40 RPM	at Fn = K
Delta EGT	approximately −4°C	at Fn = K
Delta PT2.5/PT2	approximately +0.14 ratios	at P4.95/PT2 = K
Delta PS3/PT2.5	approximately −0.5 ratios	at P4.95/PT2 = K

PARAMETER SHIFT WITH ABNORMAL FAN OPERATION
Table 1307

P. Engine Pressure Ratio (EPR) Rating Classification

(1) The necessary EEC programming plug is specified by a part number and EPR class system. The programming plug part number is specified by the engine model and thrust rating. For the necessary EEC programming plug part number, see Table 1304, Table 1305 or Table 1306. The necessary EPR Class must be selected by Engine Pressure Ratio (EPR), see SB PW4ENG 73−203.

(2) The plug part number and class is shown on the engine data plate. If a new part number or class plug is used, you must write (scribe) the new part number and class on the engine data plate.

(3) Make a EEC programming plug selection as follows:

(a) See SB PW4ENG 73−203 for the necessary Engine Programming Plug (EPP) for the engine model and hardware configuration that was tested. Confirm that the appropriate EPP part number was installed during acceptance testing.

NOTE: If the incorrect program plug (EPP) was installed during acceptance testing, contact Pratt & Whitney for assistance in correcting data/or rerun with the correct program plug.

(b) EPR class modifiers are used to make sure that the engine pressure ratio sent to the aircraft is less than the given limits. This will make sure that the engine will always give rated thrust at all possible take−off settings. The EPR limit is called "MAX EPR" and is shown in Table 1308.

NOTE: A PW4152 engine must only use the Bands A, B, and C points for the EPR Modifier classification. The PW4156A and PW4158 engines can use the Bands A, B, C and D points in the calculations.

(c) Use EPR-0 and Corrected Net Thrust from the four performance calibration points to find the EPR modifier class. Find the EPR modifier class which gives the highest EPR value and does not go more than the MAX EPR LIMIT specified by Table 1308. Make a straight line curve to fit between the points shown on Table 1308.

NOTE: To calculate EPR-0, go to Paragraph G.(1), Acceptance Test General Specifications.

NOTE: Make sure that the Stage 2.5 bleed valve is in the closed location. Do not use any data points (D band point) where the Stage 2.5 bleed valve starts to open to calculate the modifier class.

(d) To calculate EPR, use the EPR class defined above where EPR = EPR-0 + EPR Modifier. EPR is the value used in Paragraph Q, Check For Engine Acceptance, to check for engine acceptance and to calculate engine margin to the limits.

(e) If multiple ratings are desired, testing need only be performed to the highest rating desired and with a 3rd order curve fit of the four point acceptance data, other "A" band rating EPR-0 values can be found for EPR classification purposes as follows:

1 Use the four point acceptance data to find the 3rd order fit of thrust EPR-0.

2 Find the value of EPR-0 at the rating desired (use the minimum band thrust from Figure 1304).

3 Use the value of EPR-0 and thrust value calculated in step 2 above as the "A" band point. Find the EPR class requirement with the procedure in step (c) above. (Use the calculated A band point, with B, C, and D band from the data).

(f) An example of the EPR class calculation (for a PW4158 configuration) is shown in Table 1309.

FOR THESE CONFIGURATIONS (PRE PHASE 3): PW4152, PW4156A, PW4158

CORRECTED NET THRUST LBS (N)	MAXIMUM EPR
34000 lbf (151239.5 N)	1.2664
35000 lbf (155687.8 N)	1.2775
36000 lbf (160136.0 N)	1.2885
37000 lbf (164584.2 N)	1.2996
38000 lbf (169032.4 N)	1.3107
39000 lbf (173480.7 N)	1.3219
40000 lbf (177928.9 N)	1.3332
41000 lbf (182377.1 N)	1.3446
42000 lbf (186825.3 N)	1.3563
43000 lbf (191273.5 N)	1.3680
44000 lbf (195721.8 N)	1.3799
45000 lbf (200170.0 N)	1.3921
46000 lbf (204618.2 N)	1.4044
47000 lbf (209066.4 N)	1.4170
48000 lbf (213514.7 N)	1.4299
49000 lbf (217962.9 N)	1.4432
50000 lbf (222411.1 N)	1.4568
51000 lbf (226859.3 N)	1.4709
52000 lbf (231307.5 N)	1.4854
53000 lbf (235755.8 N)	1.5004
54000 lbf (240204.0 N)	1.5159
55000 lbf (244652.2 N)	1.5319
56000 lbf (249100.4 N)	1.5486
57000 lbf (253548.7 N)	1.5659
58000 lbf (257996.9 N)	1.5839
59000 lbf (262445.1 N)	1.6026
60000 lbf (266893.3 N)	1.6220

MAXIMUM EPR
Table 1308

EXAMPLE OF CALCULATING EPR MODIFIER CLASS FOR PW4158 ENGINE CONFIGURATIONS

Step 1.
Start with the four performance calibration points from engine test.

CORRECTED NET THRUST

LBS (N)	(EEC EPR) EPR-028	TLRA	DELTA EPR MOD [SEE PARA. G. (1)]	= EPR-0
58125 lbf (258552.9 N)	1.555	79.8	.028	1.583
51500 lbf (229083.4 N)	1.444	74.2	.028	1.472
46209 lbf (205547.9 N)	1.376	70.1	.026	1.402
41066 lbf (182670.7 N)	1.317	65.7	.022	1.339

Step 2.
At the Corrected Net Thrust level of the four performance calibration points, find the Maximum EPR as shown in Table 1308. Make a straight line curve to fit between the points shown on Table 1308.

CORRECTED NET THRUST

LBS (N)	EPR-MAX
58125 lbf (258552.9 N)	1.5862
51500 lbf (229083.4 N)	1.4782
46209 lbf (205547.9 N)	1.4070
41066 lbf (182670.7 N)	1.3454

Step 3.
Find the delta EPR value for each point of Maximum EPR:

CORRECTED NET THRUST

LBS (N)	EPR-MAX	EPR-0	DELTA EPR

EXAMPLE OF CALCULATING EPR MODIFIER FOR PW4158 ENGINES
Table 1309

EXAMPLE OF CALCULATING EPR MODIFIER
CLASS FOR PW4158 ENGINE CONFIGURATIONS

58125 lbf (258552.9 N)	1.5862	1.583	.0032
51500 lbf (229083.4 N)	1.4782	1.472	.0062
46209 lbf (205547.9 N)	1.4070	1.402	.0006
41066 lbf (182670.7 N)	1.3454	1.339	.0064

Step 4.
To find the EPR Class Number, use the delta EPR value from Step 3. above, and go to Table 1303.

DELTA EPR	CLASS NUMBER	EPR MODIFIER
0.0032	9	+0.000
0.0062	8	+0.004
0.0006	9	+0.000
0.0064	8	+0.004

Step 5.
The EPR Modifier Class 9 will give the highest possible EPR and will not be more than the EPR-Max limit, (highest class number from above). Make a Class 9 modifier selection and then calculate EPR.

EPR-0	EPR MODIFIER	EPR
1.583	0	1.583
1.472	0	1.472
1.402	0	1.402
1.339	0	1.339

EXAMPLE OF CALCULATING EPR MODIFIER FOR PW4158 ENGINES
Table 1309 (Continued)

Q. Check For Engine Acceptance

CAUTION: MAKE SURE THAT THE STAGE 2.5 BLEED VALVE IS IN THE CLOSED LOCATION. DO NOT USE ANY DATA POINTS TO CALCULATE ACCEPTANCE TO THE LIMITS WHERE THE STAGE 2.5 BLEED VALVE STARTS TO OPEN (D BAND POINT).

(1) The steady state values of corrected N2, N1 and TT4.95 (EGT) versus modified engine pressure ratio (EPR = EPR-0 + EPR Modifier) must be below the limits of Figure 1310 (Sheet 1), Figure 1310 (Sheet 2), Figure 1310 (Sheet 3), Figure 1311 (Sheet 1), Figure 1311 (Sheet 2), Figure 1311 (Sheet 3), Figure 1312 (Sheet 1) and Figure 1312 (Sheet 2). All the calibration points (A Band through D Band) must be examined relative to the limit lines. A large difference between the calibration points and the limit line can indicate instrumentation or engine problems. Use A Band thrust levels for NH and NL acceptance. Use A Band and B Band thrust levels for EGT acceptance. Calculate the EGT margin to the limit line, the engine is acceptable if the average of the A Band and B Band margins is positive (greater than zero).

(a) Figure 1312 (Sheet 1) and Figure 1312 (Sheet 2) shows two maximum EGT limit curves. The upper EGT limit curve applies in all cases except when an engine is tested immediately following high turbine refurbishment. The lower EGT limit curve is to be used only after a high turbine refurbishment (turbine clearances restored) and before engine has flown with turbine cooling air system on.

(b) The N1 rotor speed limits are shown in Figure 1311 (Sheet 1),Figure 1311 (Sheet 2) and Figure 1311 (Sheet 3).

(c) Do an N2 Speed Limit Analysis. Figure 1310 (Sheet 1), Figure 1310 (Sheet 2) and Figure 1310 (Sheet 3) presents the corrected rotor speed limits for engines with either SVS 29 N2 BIAS or SVS 29-2 N2 BIAS. Refer to Table 1304 through Table 1306 to determine which SVS N2 limit line to use. Refer to the calculation procedures shown in Figure 1302 (Sheet 2), Item 5. Choose the correct calculation procedure based on the control version that is installed at the time of the test.

NOTE: The EEC incorporates a N2 biased stator vane schedule (SVS). This schedule closes the HPC variable stator vanes 5 degrees for observed N2 rotor speeds less than 9550 N2 RPM and 9830 N2 RPM for RCC. The SVS transitions linearly to either the original OPEN schedule (SVS 29) or a closed (SVS 29-2) 2 degree schedule (HPC RCC post SB 72-756) at N2 rpm's above 10250. Since the N2 Limit Curve Figure 1310 (Sheets 1 through 3) is based on the original OPEN schedule, an adjustment must be made to the N2 data points before they are compared to this N2 Speed Limit Curve, Figure 1310 (Sheets 1 through 3).

(d) Figure 1310 (Sheet 1), Figure 1310 (Sheet 2), and Figure 1310 (Sheet 3) includes the more restrictive speed limits that are necessary for post SB PW4ENG 72-557 engines, (with redesigned 5th stage compressor blade). For simplicity, the more restrictive limits (if they are different) are to be used for both pre and post SB PW4ENG 72-557 engine configurations.

(e) For an example of a N2 Speed Limit Analysis, see Table 1310A for engines running SVS 29 N2 BIAS or see Table 1310B for engines running SVS 29-3 N2 BIAS. An example of a calculation for an engine running SVS 29 N2 BIAS is shown in Table 1311.

EXAMPLE - PROCEDURE TO DO AN N2 SPEED LIMIT ANALYSIS FOR ENGINES RUNNING WITH SVS 29 N2 BIAS

Step 1. Calculate the Corrected Observed N2:

Corrected Observed N2 = Observed N2/SQRT (THETA T2)

Step 2. Calculate FACTOR (Percent difference in N2, SVS 29-5 deg relative to SVS 29):

FACTOR = 1.11244 - 3.93387 x P4.95Q2 + 2.82184 x $P4.95Q2^2$

Where P4.95Q2 = PT4.95/PT2

Step 3. Calculate N2Rcl (Corrected N2 adjusted to SVS 29-5 deg):

If Observed N2 <= 9550 rpm, N2Rcl = Corrected Observed N2

If 9550 < Observed N2 < 10250

N2Rcl = Corrected Observed N2 x [1 + (FACTOR x [Observed N2-9550])/70000]

If Observed N2 >= 10250 rpm, go to step 4b

Step 4. Calculate N2Rop (Corrected N2 adjusted to SVS 29):

(a) If Observed N2 < 10250 rpm, N2Rop = N2Rcl/(1+ FACTOR/100)

(b) If Observed N2 >= 10250 rpm, N2Rop = Corrected Observed N2

Step 5. Calculate Corrected High Rotor Speed - RPM:

Corrected High Rotor Speed = N2Rop/KHN2 + delta N2 (See Figure 1302, (Sheet 4) NOTE 4.

Where KHN2 is found from Figure 1308.

PROCEDURE FOR CALCULATING CORRECTED HIGH ROTOR SPEED (N2) FOR LIMIT ANALYSIS FOR ENGINES RUNNING WITH SVS 29 N2 BIAS
Table 1310A

EXAMPLE − PROCEDURE TO DO AN N2 SPEED LIMIT ANALYSIS
FOR ENGINES RUNNING WITH SVS 29−3 N2 BIAS

PROCEDURE FOR CALCULATING CORRECTED HIGH ROTOR SPEED (N2) FOR
LIMIT ANALYSIS FOR ENGINES RUNNING WITH SVS 29−5 N2 BIAS
Table 1310C

EXAMPLE - PROCEDURE TO DO AN N2 SPEED LIMIT ANALYSIS
FOR ENGINES RUNNING WITH SVS 29-2 N2 BIAS

Step 1. Calculate the Corrected Observed N2:

Corrected Observed N2 = Observed N2/SQRT (THETA T2)

Step 2. Calculate FACTOR (Percent difference in N2, SVS 29-5 deg relative to SVS 29):

FACTOR = 1.11244 - 3.93387 x P4.95Q2 + 2.82184 x $P4.95Q2^2$
Where P4.95Q2 = P4.95/P2

Step 3. Calculate N2Rcl (Corrected N2 adjusted to SVS 29-5 deg):

If Observed N2 <= 9830 rpm, N2Rcl = Corrected Observed N2

If 9830 < Observed N2 < 10250

N2Rcl = Corrected Observed N2 x [1 + (FACTOR x 0.6 x [Observed N2-9830])/42000]

If Observed N2 >= 10250 rpm, go to step 4(b)

Step 4. Calculate N2Rop (Corrected N2 adjusted to SVS 29):

(a) If Observed N2 < 10250 rpm, N2Rop = N2Rcl/(1+ FACTOR/100)

(b) If Observed N2 >= 10250 rpm, N2Rop = (Corrected Observed N2) / [1+0.4 X (FACTOR)/100]

Step 5. Calculate Corrected High Rotor Speed - RPM:

Corrected High Rotor Speed = N2Rop/KHN2 + delta N2
(See Figure 1302 (Sheet 4) NOTE 4.

Where KHN2 is found from Figure 1308.

PROCEDURE FOR CALCULATING CORRECTED HIGH ROTOR SPEED (N2) FOR LIMIT ANALYSIS FOR ENGINES RUNNING WITH SVS 29-2 N2 BIAS
Table 1310D

EXAMPLE - N2 SPEED LIMIT ANALYSIS - PW4158
ENGINE RUNNING WITH SVS 29 N2 BIAS

Step 1. Calculate the Corrected Observed N2:

Parameter Point	1	2	3	4

Margin (RPM)	390	312	268	232

EXAMPLE - N2 SPEED LIMIT ANALYSIS - PW4158 ENGINE
Table 1311

R. Procedures Necessary After Testing

(1) Oil consumption.

NOTE: When you do the visual inspection for leaks, it is possible to see a small quantity of remaining oil in the area of the spinner, at the bottom of the fan case, or at the HPC variable vane attach bolts at the bottom of the engine. The source of this oil is either the No. 1 bearing carbon seal assembly or the No. 2 bearing rear carbon seal assembly. After the engine windmills or after a long start procedure (conditions where carbon seal pressure differences are very low or negative), a small quantity of oil can get through the carbon seals and go to the external parts of the engine. This condition is satisfactory and is permitted. All other conditions of the inspection must be satisfactory. A limit for the quantity of oil that is permitted is not given. The limits that should be used when you make an estimate of the quantity of oil is oil consumption level.

(a) Between 10 and 15 minutes after engine shutdown, fill the oil tank manually as shown in the procedures of 72−00−00 Servicing−02 (Task 72−00−00−610−002) or 72−00−00 Servicing−03 (Task 72−00−00−610−003). Use a graduated measuring device and make a record of the quantity of engine oil that is added.

(b) Make a record of the engine oil consumption in gal/hr (l/hr) in the engine logs.

(c) If there is more oil in the oil tank after the Acceptance Test than before (such as oil that comes out the scupper drain), the oil must be checked for fuel by a laboratory.

(2) Seal Leakage Limits.

(a) Measure the quantity of leakage in each seal drain collection bottle. The leakage limits for each seal drain are shown in 71−00−00 Power Plant General − Testing−00, Engine Operation Limits, (Task 71−00−00−990−007).

(3) Check Filters.

(a) Remove the main oil filter and seals. Examine the filter for pieces of unwanted material (chips) and contamination. Record the results in the engine logs. Install a new main oil filter and seals.

(b) Remove the fuel filters and seals. Examine the filter for pieces of unwanted material (chips) and contamination. Record the results in the engine logs. Install new fuel filters and seals.

R 1 Look for bronze colored particles. If you find
R bronze contamination, you must replace the fuel
R metering unit and the fuel pump.

(4) Preservation.

(a) For engine preservation refer to 72−00−00, Storage/Transport−03, Accomplish Engine Preservation, (Task 72−00−00−620−001).

- Note 1 through Note 11 ..... See Sheet 4 Definitions

Item (1) Corrected Net Thrust - lbs

$$\frac{\text{Total (FN)}}{\delta T2} = \left(\frac{\text{Observed Thrust}}{\delta T2} \right) + \text{Delta FN}_{\text{Note 1}}$$

Item (2) Corrected Fuel Flow - lbs/hr

$$\frac{WF}{(\delta T2)\ (KC)\ (KHWF)} = \left(\frac{\text{Observed Fuel Flow}}{(\delta T2)\ (KC)\ (KHWF)} \right) \times \left(\frac{LHV}{18400} \right) + \text{Delta WF}_{\text{Note 2}}$$

KC is defined as $(\theta T2)^{0.59}$

KHWF is determined as follows:

(a) Obtain a value of KH' (min) which is a function of specific humidity (lbs moisture per lb of dry air) from Figure 1307. This value is a minimum correction and will be compared with that obtained in the following step.

(b) Using recorded ambient temperature and Corrected Net Thrust from Item (1) above, obtain values of C1 (Figure 1305), C2, and C3 (Figure 1306). Calculate KH' using the following equation:

$KH' = C1(SH + C2) + C3$, where SH = specific humidity (lbs moisture/lb dry air)

(c) Set KHWF equal to the greater of the values of KH' calculated above in Item (2) (a) and (b).

(d) LHV = Lower Heating Value of fuel in BTU/LBM.

PW V

Correction Of Observed Data
Figure 1302 (Sheet 1)
(Task 71-00-00-760-020)

CORRECTION OF OBSERVED READINGS (SHEET 2 OF 4)

Item (3) Corrected Thrust Specific Fuel Consumption (TSFC) – lbs/hr/lb

$$\left(\frac{TSFC}{(KC)\ (KHWF)}\right) = \left(\frac{\text{Corrected Fuel Flow}}{\text{Corrected Net Thrust}}\right) = \left\{\frac{\left[\frac{WF}{(\delta T2)\ (KC)\ (KHWF)}\right]}{\left[\frac{FN}{\delta T2}\right]}\right\}$$

Item (4) Corrected Low Rotor Speed – RPM

$$\left[\frac{N1}{\sqrt{\theta T2}\ (KHN1)}\right] = \left(\frac{\text{Observed N1}}{\sqrt{\theta T2}\ (KHN1)}\right) + \text{Delta N1}_{\text{Note 3}}$$

where KHN1 is found from Figure 1308.

Item (5) Corrected High Rotor Speed – RPM

Engines running with SVS 29 N2 BIAS:
See calculation procedure outlined in Table 1310 A.
Engines running with SVS 29-2 N2 BIAS:
See calculation procedure outlined in Table 1310 D.
Note 1: For an example calculation procedure for SVS 29 N2 BIAS configuration see Table 1311.
Note 2: Refer to Tables 1304 through 1306 determine which SVS N2 BIAS is used.

Item (6) Corrected Exhaust Gas Temperature (EGT) – ^{o}C

$$\left[\frac{TT4.95\,^{o}C}{(\theta T2)^{1.0}\ \ (KHT4.95)}\right] = \left[\frac{\text{Observed TT4.95}\,^{o}C+273.16}{(\theta T2)^{1.0}\ \ (KHT4.95)}\right] - (273.16) + \text{Delta TT4.95}_{\text{Note 5}}$$

where KHT4.95 is found from Figure 1308.

Item (7) Corrected Station 3 Temperature – ^{o}C

$$\left[\frac{TT3\,^{o}C}{(\theta T2)^{0.932}}\right] = \left[\frac{\text{Observed TT3}\,^{o}C + 273.16}{(\theta T2)^{0.932}}\right] - (273.16) + \text{Delta TT3}_{\text{Note 6}}$$

(Task 71-00-00-760-020)

CORRECTION OF OBSERVED READINGS (SHEET 3 OF 4)

Item (8) Corrected Station 2.5 Temperature – °C

$$\left[\frac{\text{TT2.5°C}}{(\theta\text{T2})^{0.985}}\right] = \left[\frac{\text{Observed TT2.5°C} + 273.16}{(\theta\text{T2})^{0.985}}\right] - (273.16) + \text{Delta TT2.5}_{\text{NOTE 7}}$$

Item (9) Test Stand Engine Pressure Ratio $= \left(\frac{\text{PT4.95}}{\text{PT2}}\right)$

Item (10) Corrected Turbine Cooling Air Pressure Ratio
PS4I Instrumentation Optional

$$\left(\frac{\text{PS4I}}{\text{PT3}}\right) = 0.97 \times \left(\frac{\text{PS4I}}{\text{PS3}}\right)$$

Item (11) Corrected Compressor Pressure Ratios:

Low Compressor

$$\left(\frac{\text{PT2.5}}{\text{PT2}}\right) = \left(\frac{\text{Observed PT2.5}}{\text{PT2}}\right) \times (\theta\text{T2})^{0.08} + (\text{Delta PT2.5/PT2}_{\text{NOTE 8}})$$

High Compressor

$$\left(\frac{\text{PS3}}{\text{PT2.5}}\right) = \left(\frac{\text{Observed PS3}}{\text{PT2.5}}\right) \times (\theta\text{T2})^{-0.08} = (\text{Delta PS3/PT2.5}_{\text{NOTE 9}})$$

Overall Compressor

$$\left(\frac{\text{PS3}}{\text{PT2}}\right) = \left(\frac{\text{Observed PS3}}{\text{PT2}}\right) + \text{Delta PS3/PT2}_{\text{NOTE 10}}$$

Item (12) Overall Corrected Turbine Pressure Ratio

$$\left(\frac{\text{PS3}}{\text{PT4.95}}\right) = \left(\frac{\text{Observed PS3}}{\text{PT4.95}}\right) + \text{Delta PS3/PT4.95}_{\text{NOTE 11}}$$

POWER PLANT GENERAL − TESTING−09

Task 71−00−00−760−061:

1. Test No. 9 − Engine Acceptance Test

A. Prerequisite Procedure

CAUTION: ENGINE CONFIGURATION IDENTIFIER MUST BE CAREFULLY DETERMINED. FAILURE TO CORRECTLY IDENTIFY CONFIGURATION COULD RESULT IN RED LINE EXCEEDANCE AND/OR THRUST SHORTFALL

(1) Use Table 1301 to get the necessary Testing−09 configuration. Get the engine configuration from the engine identification data plate. Look for a configuration identification suffix marked after the engine model in the model field.

(a) EXAMPLE 1:

1 If "PW4158 (−3)" is marked on the engine identification plate, the configuration identifier suffix is "(−3)". This corresponds to a Phase 3 configuration as specified in Table 1301. Use TESTING−09, CONFIG−2 to do the acceptance test.

(b) EXAMPLE 2:

1 If "PW4158" is marked on the engine identification plate with no configuration identifier suffix, the configuration is Pre Phase 3 as specified in Table 1301. Use TESTING−09, CONFIG−1 to do the acceptance test.

TESTING−09 CONFIGURATION	ENGINE CONFIGURATION	CONFIGURATION IDENTIFICATION SUFFIX
Config−1	Pre Phase 3	None
Config−2	Phase 3 (Reference SB PW4ENG 72−572)	(−3)
Config−3	Intermix (−1C or −1E) (Reference SB PW4ENG 72−516)	(−1C/−1E)
Config−4	NOT AVAILABLE for Airbus installations	

TESTING−09 CONFIG/ENGINE CONFIGURATION
Table 1301

TESTING-09 CONFIGURATION	ENGINE CONFIGURATION	CONFIGURATION IDENTIFICATION SUFFIX
Config-5	Intermix (-3A) (Reference SB PW4ENG 73-150)	(-3A)

TESTING-09 CONFIG/ENGINE CONFIGURATION
Table 1301 (Continued)

(2) Use this procedure to test the engine for satisfactory performance after one or more components or modules have been replaced or repaired. This test is also used after the engine was fully disassembled, repaired and assembled.

NOTE: It is recommended that you not install large quantities of blended blades, vanes and airseals in one engine. If these parts are blended to the maximum limits in many areas, the result will be low engine performance.

(3) It is possible that other tests are necessary before you do this test, see 71-00-00 Power Plant General - Testing-00, Test Requirements After Engine/Module/Component Repair or Replacement, Task 71-00-00-990-003. This procedure will also give the sequence for the necessary tests.

(4) Special instrumentation must be installed on the engine before the engine is operated for this test.

(5) The engine testing must be done in a test configuration and test cell that has been calibrated. Calibrate to the specifications shown in P&W Publication Report No. 544. All test data must be corrected to the special test cell correction factors before you use the limits and curves in this procedure.

(6) For general safety information, see 71-00-00, Power Plant General - Testing-00, Engine Safety Precautions, Task 71-00-00-990-004.

(7) For safe engine operation, see 71-00-00, Power Plant General - Testing-00, Precautions And Procedures For Safe And Correct Engine Operation, Task 71-00-00-760-002.

(8) For engine operation limits, see 71-00-00, Power Plant General - Testing-00, Engine Operation Limits, Task 71-00-00-990-007.

B. Equipment And Materials Necessary

Standard Tools (See 71-00-00, Power Plant General - Testing-00, Prepare The Engine For Test In A Cell, Task 71-00-00-480-001

(1) Fuel pump drain hose and collection bottle.

(2) Stator vane drain hose and collection bottle.

(3) Station 2.5 compressor bleed actuator drain hose and collection bottle.

(4) Air/oil cooler modulating valve drain hose and collection bottle.

(5) IDG air/oil cooler modulating valve drain hose and collection bottle.

(6) TCC actuator modulating valve drain hose and collection bottle.

(7) Accessory drive fluid power pump drain hose and collection bottle.

(8) Starter drive drain hose and collection bottle.

(9) IDG drain hose and collection bottle.

(10) Accessory drive EEC generator seal drain hose and collection bottle.

(11) Fuel/oil heat exchanger IDGS core drain hose and collection bottle.

(12) Fuel/oil heat exchanger engine oil core drain hose and collection bottle.

(13) Fuel/oil heat exchanger IDG center tube drain hose and collection bottle.

(14) Bypass valve drain hose and collection bottle.

(15) Hydraulic pump drain hose and collection bottle.

C. Test Instrumentation And Test Cell Connections.
Install the special instrumentation and equipment that follows:

(1) PT2 and PS2 (8 locations) − (optional)

(2) PT2/TT2 Rosemount probe − (PWA 85523)

(3) TT2 − Compressor inlet total temperature (8 locations)

(4) Fuel flow (observed)

(5) T Fuel

(6) N1 RPM − (NL)

(7) N2 RPM − (NH)

(8) PT2.5*

(9) PS3

(10) PS4I (Optional)

(11) PT4.95

(12) Main Oil Pressure

(13) Main Oil Temperature

(14) Oil Filter Differential Pressure

(15) Fuel Pump Inlet Pressure

(16) Fuel Pump Pressure

(17) PAMB

(18) TT2.5*

(19) TT3*

(20) Vibration, fan case flange A (vertical)

(21) TT4.95 Harness Average (stand reading) If EEC T49 value is used, adjustment to T4.95 (real without shunt) must be made.

(22) Thrust − (observed)

(23) Thrust Lever and Fuel Select Switch

(24) Ignition Switch

(25) Test Cell Fuel Supply Pressure

(26) ARINC 429 transceiver.

(27) No. 3 Bearing Compartment Breather Pressure

* - A necessary parameter for the module analysis program MAPNET System. Optional unless a MAPNET System analysis is necessary.

D. Thrust Rating and Operation Limits

(1) Ratings at static sea level standard conditions are shown in Table 1302.

ENGINE MODEL	THRUST SETTING	JET THRUST LBS. (N)	TSFC *
PW4152 (-3)	TAKEOFF	51110 (227348)	0.3353
PW4152 (-3)	MAX CONTINUOUS	47160 (209778)	0.3284
PW4152 (-3)	90% MAX CONTINUOUS	42450 (188827)	0.3219
PW4152 (-3)	70% MAX CONTINUOUS	34200 (152129)	0.3154
PW4156A (-3)	TAKEOFF	55950 (248878)	0.3457
PW4156A (-3)	91% TAKEOFF	51000 (226859)	0.3351
PW4156A (-3)	MAX CONTINUOUS	45730 (203417)	0.3262
PW4156A (-3)	90% MAX CONTINUOUS	40940 (182110)	0.3202
PW4158 (-3)	TAKEOFF	57610 (256262)	0.3498
PW4158 (-3)	88% TAKEOFF	51000 (226859)	0.3351
PW4158 (-3)	MAX CONTINUOUS	45490 (202349)	0.3259
PW4158 (-3)	90% MAX CONTINUOUS	40770 (181354)	0.3201

*NOTE: TSFC (Thrust Specific Fuel Consumption) is for reference only for a new engine and is not necessary for the engine Acceptance Test.

THRUST AND TSFC RATINGS AT SEAL LEVEL STANDARD CONDITIONS
Table 1302

(2) The engine speed limits are shown in 71-00-00, Power Plant General - Testing-00, Engine Operation Limits, Task 71-00-00-990-007.

(3) The engine exhaust gas temperature (EGT) limits for Station 4.9 are shown in 71−00−00, Power Plant General − Testing−00, Engine Operation Limits, Task 71−00−00−990−007.

E. Seal Drain Leakage Limits

(1) During the Acceptance Test, the seal leakage must be measured. See 71−00−00, Power Plant General − Testing−00, Engine Operation Limits, Task 71−00−00−990−007.

(2) Attach a hose to each seal drain connection and put the other end of the hose in a collection bottle. Each bottle must be identified.

F. Multi−Point Instrumentation

(1) Multi−point instrumentation is necessary and is measured during the acceptance test for some parameters. To get satisfactory data, there is a limit for sampling points that do not operate. The necessary multi−point instrumentation and points that do not operate are listed as follows:

(a) TT2 − Eight sampling points are necessary with a maximum limit of two points that do not operate.

(b) Bellmouth pitot static probes (PT2 and PS2) − This parameter is optional. If it is used, eight sampling points are necessary with a maximum limit of two points that do not operate.

(c) Pitot static probes must be installed for test cell correlation testing. See the specifications shown in P&W publication Report No. 544.

(d) PT2 can be calculated for post test cell correlation testing without pitot static probes. Do a correlation of PT2 (pitot static) to: PT2 Rosemount probe, P cell or (PT2/Pamb vs N1 corrected).

G. Acceptance Test General Specifications

(1) Use the definitions that follow during the acceptance test.

(a) EPR−0 = Engine Pressure Ratio from the EEC (Electronic Engine Control) instrumentation system with a zero delta EPR modified (Class 09) Engine Program Plug (EPP) installed in the Electronic Engine Control (EEC).

OR

EPR−0 can be calculated by adding the necessary EPR Modification (delta EPR) used during the test run to the EPR output from the Engine Control (Engine Electronic Control EPR therefore EECEPR).

In the Airbus Engine Control logic EPR modification (delta EPR) is a function of TRA (throttle lever resolver angle). To correctly calculate EPR−0 from EECEPR, EPR class and TRA are necessary.

The Control logic removes the EPR modification (delta EPR) at low power to align the right and left wing engines. This logic is unique to Airbus installations and controls because it occurs in sea level test range, (below "C" band point when the TRA is less than 72 degrees).

Calculation of EPR−0. Because the recommended test configuration is with a class 16/ −0.028 delta EPR modifier, the calculation is shown as follows:

EECEPR = EPR−028

If TRA is equal or greater than 72 degrees,
EPR−0 = EPR−028 + .028

If TRA is between 40.5 and 72 degrees,
EPR−0 = EPR−028 + (1−(72−TRA)/31.5) x .028

If TRA is equal or less than 40.5 degrees,
EPR−0 = EPR−028

For other EPR class modifiers (other than class 16), see Table 1303 for values.

(b) EPR-028 = Engine Pressure Ratio form the EEC (Electronic Engine Control) instrumentation system with a class 16 (-0.028 delta) EPR modifier Engine Programming Plug (EPP) installed in the EEC.

(c) EPR = Engine Pressure Ratio From the EEC (Electronic Engine Control) instrumentation system with a class EEC programming plug to be calculated. To calculate EPR, (EPR-0 + delta EPR modifier). EPR is the value used in Paragraph Q. Check For Engine Acceptance to check for engine acceptance and to calculate engine margin to the limits.

(d) TRA = Throttle Resolver Angle, position of the EEC thrust control lever as specified by the electrical signal from the EEC.

EPR CLASS	EPR MODIFICATION (DELTA EPR)
01	+ .032
02	+ .028
03	+ .024
04	+ .020
05	+ .016
06	+ .012
07	+ .008
08	+ .004
09	0.0
10	- .004
11	- .008
12	- .012
13	- .016
14	- .020
15	- .024
16	- .028

EEC PROGRAMMING PLUG (EPP) CLASSIFICATION
Table 1303

(2) All Acceptance Test specifications are from the test cell instrumentation except the EPR (Engine Pressure Ratio) which is the EPR value from the EEC. The EEC values for Tt2, N1, N2 can be used if it is shown they are consistent and equal to the stand readings. This must be done during the test cell correlation testing. The EEC values must be within the limits and tolerances of 71-00-00 Testing-00 Table 1305 of Test Instrumentation Calibration (Task 71-00-00-990-002).

Any exceptions to this rule will be specified in the test procedure or correction to the observed section.

CAUTION: IF YOU USE AN INCORRECT EPP PLUG DURING ENGINE TEST, YOU WILL CAUSE ERRORS IN SETTING THE EPR RATING CLASSIFICATION AND IN DETERMINING ENGINE ACCEPTANCE TO LIMITS OF PARAGRAPHS Q. AND R. RESPECTIVELY.

(3) For standardization for all PW4000 engine models and to make sure that the engine will make Takeoff thrust, it is recommended that the Acceptance Testing be done with a class 16 EEC Programming Plug (EPP) installed in the EEC. Refer to SB PW4ENG 73-203 for EEC Programming Plug (EPP) part number for testing.

(4) After the Acceptance Test, the necessary class and part number of EEC programming plug must be selected. You must calculate the necessary class and get the part number from SB PW4ENG 73-203. After you select the necessary EEC programming plug, install it in the EEC. See the Component Maintenance Manual (CMM), - EEC Data Entry Plug, PN 50A450. This manual has the procedure for setting the plug classification.

(5) The EEC has logic for operation in two modes:

(a) EPR = This is the primary mode.

(b) N1 = This is the alternate mode which is the backup mode (default) for the EPR mode.

(c) The Acceptance Test must be done in the EPR mode.

POWER PLANT GENERAL - TESTING-09

H. Procedures To Prepare For Test

(1) Check that all the test instrumentation is calibrated and that there are no leaks.

(2) Service the engine oil system as shown in the procedures of 72-00-00 Servicing-02 (Task 72-00-00-610-002) or 72-00-00 Servicing-03 (Task 72-00-00-610-003).

(3) Prime the engine. See 71-00-00 Power Plant General-00, Oil and Fuel Systems Priming Procedure, (Task 71-00-00-760-003).

(4) Do the EEC static test. See 71-00-00 Test No. 7 - EEC Static Test, (Task 71-00-00-760-038).

I. Testing Prior to Acceptance Test

(1) Do the EEC idle test. See 71-00-00 Test No. 6 - EEC Idle Test, (Task 71-00-00-760-037).

NOTE: Start the engine with one Igniter A only.

(2) Do the idle leak test. See 71-00-00 Test No. 3 - Idle Power Test, (Task 71-00-00-760-030). Check for leaks, if necessary do an engine shutdown and repair any leaks.

NOTE: You can do Test No. 6 and 3 at the same time.

(3) Let the engine become stable for five minutes at MINIMUM IDLE.

(4) Make sure all the engine parameters are in the permitted limits. See Power Plant General - Testing-00, Engine Operation Limits, (Task 71-00-00-990-007).

(a) Make sure that the main oil pressure is in limits. The oil pressure must also be in the acceptance band shown in 71-00-00, Test No. 13, (Task 71-00-00-760-047).

(b) Make sure that the No. 1 - 2 bearing compartment breather pressure is in limits.

(c) Make sure that the No. 3 bearing compartment breather pressure is in limits.

(d) Make sure that the No. 3 bearing compartment scavenge temperature (T3 SCAV) is in limits.

(e) If the optional PS4I instrumentation is installed, make sure that the turbine cooling air pressure ratio (TCAR) is in the operator's historical range.

NOTE: The turbine cooling air ratio (TCAR) check is removed from all PW4000 engine manuals. Field experience shows that the assembly instructions and TOBI flow checks are sufficient to make sure that the engine will operate correctly. You must obey the assembly and check procedures specified in the engine manual and service bulletins.

(5) Make a record of N1 RPM, N2 RPM, T4.95 (EGT), oil pressure and temperature. Check the EEC for fault messages.

NOTE: It is recommended that a complete set of data be taken at this time to check the data system. The data system must be checked before the Engine Acceptance Test.

(6) Do an engine shutdown by the Normal Shutdown Procedure, (Task 71-00-00-760-005).

(7) Check the EEC status for fault messages. Do any maintenance that is necessary.

(8) Between 5 and 35 minutes after shutdown, fill the oil tank manually as shown in the procedures of 72-00-00 Servicing-02 (Task 72-00-00-610-002) or 72-00-00 Servicing-03 (Task 72-00-00-610-003). This oil fill step will be used to calculate the engine oil consumption. The oil consumption will be calculated in gallons per hour after the Acceptance Test.

NOTE: Do not use a remote engine oil fill system during the Acceptance Test. You must not add engine oil during the Acceptance Test.

J. Acceptance Test Data Records

(1) Make a record on the engine log sheet of the general information and data as follows:

(a) Date of the Acceptance Test.

(b) Engine serial number.

(c) Serial number of modules and major components.

(d) Fuel grade and specific gravity.

(e) Engine oil specification and brand.

(f) Ambient atmospheric conditions (true barometer, wet and dry bulb temperatures).

(g) Total time of the Acceptance Test.

(h) Reasons for any engine shutdowns that are not on the schedule.

(i) Any repairs that were necessary during the Acceptance Test.

(j) If it is applicable, the reason the engine was rejected after the Acceptance Test.

(k) The test operator must sign the engine log.

(l) The test inspector must sign the log.

(2) Make a record of the engine parameters shown in Paragraph C. "Test Instrumentation And Test Cell Connections", during the Acceptance Test. Make a record at each thrust lever position during the test, (except oil consumption).

K. Initial Running

NOTE: The INITIAL RUNNING is for the LPC/HPC break−in cycle and is only necessary if the LPC or HPC or both were replaced, repaired or are new. If the LPC/HPC break−in cycle is not necessary, go to the next testing step, Engine Acceptance Test.

(1) Use the run schedule specified in Figure 1301.

(2) Start the engine by the Engine Start Procedure (Normal), (Task 71−00−00−760−004). Start engine using Igniter B. Determine and record overall time from pressurization until MINIMUM IDLE speed is reached. Record data after five minutes at MINIMUM IDLE.

(a) Record data for all stabilized test points prior to moving thrust lever to the next requirement.

(b) Verify that the main oil pressure and the No. 3 bearing compartment breather pressure are within the limits shown under Testing-00, Operating Limits, (Task 71-00-00-990-007).

(c) If the optional PS4I instrumentation is installed, make sure that the turbine cooling air pressure ratio (TCAR) is in the operator's historical range.

(d) Check EEC status and maintenance words for faults. See 71-00-00, Fault Isolation-00 (Task 71-00-00-810-001).

(3) The acceleration in this section is to be done with reverse TRA. Verify in simulated deployed position that the 2.5 bleed is 100 percent open (88 percent of actuator stroke) throughout reverse operation.

CAUTION: IF AN ENGINE STALL OCCURS DURING THIS TEST, YOU MUST MOVE THE THRUST LEVER TO MINIMUM IDLE WITHIN ONE SECOND OF THE STALL. DO THE PROCEDURES SHOWN IN TESTING-00 "PROCEDURE AFTER ENGINE SURGE OR STALL" (TASK 71-00-00-760-009) AND DO THE "START PROCEDURE AFTER AN EMERGENCY SHUTDOWN" (TASK 71-00-00-760-006). IF YOU DO NOT DO THESE PROCEDURES, YOU CAN DAMAGE THE TURBINE TIP SEALS.

(a) Make a slow acceleration (30 - 60 seconds) to 8000 N2. Stabilize for two minutes at 8000 N2. Record data at the end of the stabilization period.

(b) Continue slow acceleration to 8500 N2. Stabilize for two minutes at 8500 N2. Record data at the end of the stabilization period.

(c) Continue slow acceleration to 8800 N2. Stabilize for two minutes at 8800 N2. Record data at the end of the stabilization period.

(d) Continue slow acceleration to 9000 N2. Stabilize for two minutes at 9000 N2. Record data at the end of the stabilization period.

NOTE: At cold inlet temperature maximum reverse scheduling (fN1C), may restrict the engine from achieving 9000 rpm target.

(e) Continue slow acceleration to max reverse TRA. Stabilize for five minutes at fixed TRA. Record data at the end of the stabilization period.

NOTE: At low inlet temperatures, high N2 speeds may result in high thrusts. DO NOT EXCEED 50000 LBS FN/ST2.

(f) Make a slow deceleration (30 − 60 seconds) to MINIMUM IDLE. Stabilize at MINIMUM IDLE for 0 − 30 seconds. Take the engine out of the simulated reverse position.

(g) Continue normal acceptance running.

L. Engine Acceptance Test (to be run following initial break in running for refurbished engines and all other engines).

(1) The Acceptance Testing−09 cycle is shown in the Engine Run Schedule, Figure 1301.

(2) Start the engine by the Engine Start Procedure (Normal), (Task 71−00−00−760−004).

NOTE: Start the engine with one Igniter B only.

NOTE: Monitor the main oil pressure, (MOP), during the start procedure. If you do not see any oil pressure, you must immediately and quickly stop the start procedure.

(3) Make a record of the time from fuel pressurization to MINIMUM IDLE speed.

(4) Let the engine become stable at MINIMUM IDLE.

(5) Make sure all the engine parameters are in the permitted limits. See Power Plant General − Testing−00, Engine Operation Limits, (Task 71−00−00−990−007).

(6) Operate the engine at MINIMUM IDLE for five minutes.

(7) If the optional PS4I instrumentation is installed, make sure that the turbine cooling air pressure ratio (TCAR) is in the operator's historical range.

(8) Check EEC status and maintenance words for faults. See 71-00-00, Fault Isolation-00 (Task 71-00-00-810-001).

(9) Continue slow acceleration (90 - 120 seconds) from MINIMUM IDLE to the thrust of Band A shown in Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3). Stabilize for three minutes. Record data and install TRA stop.

(10) Do the decel vibration survey as follows.

CAUTION: IF AN ENGINE STALL OCCURS DURING THIS TEST, YOU MUST MOVE THE THRUST LEVER TO MINIMUM IDLE WITHIN ONE SECOND OF THE STALL. DO THE PROCEDURES SHOWN IN TESTING-00 "PROCEDURE AFTER ENGINE SURGE OR STALL" (TASK 71-00-00-760-009) AND DO THE "START PROCEDURE AFTER AN EMERGENCY SHUTDOWN" (TASK 71-00-00-760-006). IF YOU DO NOT DO THESE PROCEDURES, YOU CAN DAMAGE THE TURBINE TIP SEALS.

(a) Make a slow deceleration (60 - 120 seconds) to MINIMUM IDLE, surveying engine vibration.

(b) At each speed where peaks have shown during the deceleration, record the mean vibration level of each pickup after 30 second stabilization.

(c) Check that the engine vibration values are in the permitted limits. See Testing-00, Engine Operation Limits, (Task 71-00-00-990-007).

(d) For engines that are more than the permitted vibration limits, do Testing-19, Trim Balance Procedure And Test, (Task 71-00-00-760-043), (Task 71-00-00-760-052) or (Task 71-00-00-760-057).

(11) Select APPROACH IDLE. Stabilize for 15 minutes. At the end of the stabilization period, record data.

(12) Do the snap acceleration/deceleration test cycle shown in 71-00-00, Testing-04 (Task 71-00-00-760-031) and perform step B.(9)(b) through B.(9)(i) for acceleration/deceleration test). Also see Engine Run Schedule shown in Figure 1301.

NOTE: The snap acceleration/deceleration must be done after the compressor break in cycle shown in above.

(13) Vibration Survey (Acceleration).

(a) An engine vibration survey shall be conducted on an engine that has been thermally stabilized. Completion of step L.(12) above without shutdown will result in a stabilized engine. If shutdown occurs, the engine must be run at thrust Band C, Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3) or higher for three minutes and then run for six minutes at MINIMUM IDLE prior to conducting the vibration survey.

(b) Make a slow acceleration (90 - 120 seconds) from MINIMUM IDLE to thrust Band A Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3).

(c) At each speed where peaks have shown during the acceleration, record the mean vibration level of each pickup after 30 second stabilization.

(d) Check the engine vibration levels during this test to make sure that the allowable limits are not exceeded. See 71-00-00, Testing-00, Vibration Limits, (Task 71-00-00-990-007).

(e) For engines that exceed the vibration limits, see 71-00-00, Testing-19 (Task 71-00-00-760-043), (Task 71-00-00-760-052) or (Task 71-00-00-760-057).

(14) Performance Calibration.

(a) Stabilize at thrust Band A Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3) for five minutes. At the end of the stabilization period, record data.

(b) Stabilize at thrust Band B Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3) for three minutes. At the end of the stabilization period, record data.

(c) Stabilize at thrust Band C Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3) for three minutes. At the end of the stabilization period, record data.

(d) Stabilize at thrust Band D Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3) for three minutes. At the end of the stabilization period, record data.

(e) Decelerate slowly (60 - 120 seconds) to APPROACH IDLE. Stabilize for 20 minutes.

(15) Engine shutdown procedure.

(a) Do an engine shutdown by the Normal Shutdown Procedure, (Task 71-00-00-760-005).

(b) Check the EEC status for fault messages. Do any maintenance that is necessary.

M. Procedures After Engine Shutdown - Corrections Of Observed Readings.

(1) Correct the observed data collected in thrust Bands A, B, C, and D of the performance calibration. Use the procedure defined in Figure 1302 (Sheet 1), Figure 1302 (Sheet 2), Figure 1302 (Sheet 3) and Figure 1302 (Sheet 4).

N. Engine Configuration Determination

(1) Based on the engine configuration identifier suffix in Table 1301, make sure that you are in the appropriate Testing-09 CONFIG section to use to class and check the engine for acceptance.

O. Check Corrected Data

(1) If the optional PS4I instrumentation is installed, make sure that the turbine cooling air pressure ratio (TCAR) is in the operator's historical range.

(2) Values of Corrected Net Thrust versus PT4.95/PT2 corrected N1, corrected N2, and corrected EGT, should fall within the requirements of Figure 1309 (Sheet 1), Figure 1309 (Sheet 2), Figure 1309 (Sheet 3), and Figure 1309 (Sheet 4). The lines on these figures are guidelines only and are not acceptance limits. Points outside these values can suggest that there is a instrumentation and/or other problem that must be identified.

(a) Definitions of terms used in Figure 1309 are as follows:

(b) Complete Refurbishment: Bands are for engines that had all modules repaired or replaced to new engine clearances and airfoil condition.

(c) Minor or No Refurbishment: Bands are for high time service engines that are fully deteriorated without any or only a small quantity of gaspath repair.

(3) Values of corrected PT2.5/PT2 and PS3/PT2.5 versus PT4.95/PT2 should fall within the guidelines of Figure 1309 (Sheet 5) and Figure 1309 (Sheet 6). The lines of these figures are guidelines only and not acceptance limits. Points outside these values can suggest that there is a instrumentation and/or other problem that must be identified.

(4) If a review of the test high power (points generally above 52000 lbf (231307.5 N) thrust, or 1.45 PT4.95/PT2) indicate a change in level relative to the check line shape as shown in Table 1307 below, this can be an indication of abnormal fan operation. This abnormal operation is also accompanied by a noticeable tone change in the engine. This change is triggered at high power by dirty and/or severely eroded fan blade leading edges. Corrective action must be taken. Refer to 72-00-31, Repair-01 (Task 72-00-31-300-001).

(5) Corrected Thrust Specific Fuel Consumption (TSFC) must be compared with the values listed in Table 1302. These values are included for reference to new engine levels only and are not intended as an acceptance requirement.

ABNORMAL FAN OPERATION

Delta P4.95/PT2	approximately +0.015 to 0.020	at Fn = K
Delta N1C	approximately +80 to +100 RPM	at Fn = K
Delta N2C	approximately −40 RPM	at Fn = K
Delta EGT	approximately −4°C	at Fn = K
Delta PT2.5/PT2	approximately +0.14 ratios	at P4.95/PT2 = K
Delta PS3/PT2.5	approximately −0.5 ratios	at P4.95/PT2 = K

PARAMETER SHIFT WITH ABNORMAL FAN OPERATION
Table 1307

P. Engine Pressure Ratio (EPR) Rating Classification

(1) The necessary EEC programming plug is specified by a part number and EPR class system. The programming plug part number is specified by the engine model and thrust rating. For the necessary EEC programming plug part number, see Table 1304, Table 1305, Table 1306. The necessary EPR Class must be selected by Engine Pressure Ratio (EPR), see SB PW4ENG 73-203.

(2) The plug part number and class is shown on the engine data plate. If a new part number or class plug is used, you must write (scribe) the new part number and class on the engine data plate.

(3) Make a EEC programming plug selection as follows:

(a) See SB PW4ENG 73-203 for the necessary Engine Programming Plug (EPP) for the engine model and hardware configuration that was tested. Confirm that the appropriate EPP part number was installed during acceptance testing.

NOTE: If the incorrect program plug (EPP) was installed during acceptance testing, contact Pratt & Whitney for assistance in correcting data/or rerun with the correct program plug.

(b) EPR class modifiers are used to make sure that the engine pressure ratio sent to the aircraft is less than the given limits. This will make sure that the engine will always give rated thrust at all possible take-off settings. The EPR limit is called "MAX EPR" and is shown in Table 1308 or Table 1309.

NOTE: A PW4152 (-3) engine must only use the Bands A, B, and C points for the EPR Modifier classification. The PW4156A (-3) and PW4158 (-3) engines can use the Bands A, B, C and D points in the calculations.

(c) Use EPR-0 and Corrected Net Thrust from the four performance calibration points to find the EPR modifier class. Find the EPR modifier class which gives the highest EPR value and does not go more than the MAX EPR LIMIT specified by Table 1308 or Table 1309. Make a straight line curve to fit between the points shown on Table 1308 or Table 1309.

NOTE: To calculate EPR-0, go to Paragraph G.(1), Acceptance Test General Specifications.

NOTE: Make sure that the Stage 2.5 bleed valve is in the closed location. Do not use any data points (D band point) where the Stage 2.5 bleed valve starts to open to calculate the modifier class.

(d) To calculate EPR, use the EPR class defined above where EPR = EPR-0 + EPR Modifier. EPR is the value used in Paragraph Q, Check For Engine Acceptance, to check for engine acceptance and to calculate engine margin to the limits.

(e) If multiple ratings are desired, testing need only be performed to the highest rating desired and with a 3rd order curve fit of the four point acceptance data, other "A" band rating EPR-0 values can be found for EPR classification purposes as follows:

1 Use the four point acceptance data to find the 3rd order fit of thrust EPR-0.

2 Find the value of EPR-0 at the rating desired (use the minimum band thrust from Figure 1304).

3 Use the value of EPR-0 and thrust value calculated in step 2 above as the "A" band point. Find the EPR class requirement with the procedure in step (c) above. (Use the calculated A band point, with B, C, and D band from the data).

(f) An example of the EPR class calculation (for a PW4158 (-3) configuration) is shown in Table 1310.

FOR THESE CONFIGURATIONS: PW4152 (-3), PW4156A (-3), PW4158 (-3) WITH SB PW4ENG 72-256 (AERO 2.5 LPT AND SB PW4ENG 72-262 (RECAMBERED FEGV)

Start with the four performance calibration points from engine test.

CORRECTED NET THRUST

LBS (N)	(EEC EPR) EPR-028	TLRA	DELTA EPR MOD [SEE PARA. G. (1)]	= EPR-0
58125 lbf (258552.9 N)	1.555	79.8	.028	1.583
51500 lbf (229083.4 N)	1.444	74.2	.028	1.472
46209 lbf (205547.9 N)	1.376	70.1	.026	1.402
41066 lbf (182670.7 N)	1.317	65.7	.022	1.339

Step 2.
At the Corrected Net Thrust level of the four performance calibration points, find the Maximum EPR as shown in Table 1308 or Table 1309. Make a straight line curve to fit between the points shown on Table 1308 or Table 1309.

CORRECTED NET THRUST

LBS (N)	EPR-MAX
58125 lbf (258552.9 N)	1.5936
51500 lbf (229083.4 N)	1.4812
46209 lbf (205547.9 N)	1.4079
41066 lbf (182670.7 N)	1.3416

Step 3.
Find the delta EPR value for each point of Maximum EPR:

CORRECTED NET THRUST

LBS (N)	EPR-MAX	EPR-0	DELTA EPR

EXAMPLE OF CALCULATING EPR MODIFIER FOR PW4158 (-3) ENGINES
Table 1310

EXAMPLE OF CALCULATING EPR MODIFIER CLASS
FOR PW4158 (-3) ENGINE CONFIGURATIONS

58125 lbf (258552.9 N)	1.5936	1.583	.0106
51500 lbf (229083.4 N)	1.4812	1.472	.0092
46209 lbf (205547.9 N)	1.4079	1.402	.0059
41066 lbf (182670.7 N)	1.3416	1.339	.0026

Step 4.
To find the EPR Class Number, use the delta EPR value from Step 3. above, and go to Table 1303.

DELTA EPR	CLASS NUMBER	EPR MODIFIER
0.0106	7	+0.008
0.0092	7	+0.008
0.0059	8	+0.004
0.0026	9	+0.000

Step 5.
The EPR Modifier Class 9 will give the highest possible EPR and will not be more than the EPR-Max limit, (highest class number from above). Make a Class 9 modifier selection and then calculate EPR.

EPR-0	EPR MODIFIER	EPR
1.583	0	1.583
1.472	0	1.472
1.402	0	1.402
1.339	0	1.339

EXAMPLE OF CALCULATING EPR MODIFIER FOR PW4158 (-3) ENGINES
Table 1310 (Continued)

Q. Check For Engine Acceptance

CAUTION: MAKE SURE THAT THE STAGE 2.5 BLEED VALVE IS IN THE CLOSED LOCATION. DO NOT USE ANY DATA POINTS TO CALCULATE ACCEPTANCE TO THE LIMITS WHERE THE STAGE 2.5 BLEED VALVE STARTS TO OPEN (D BAND POINT).

(1) The steady state values of corrected N2, N1 and TT4.95 (EGT) versus modified engine pressure ratio (EPR = EPR-0 + EPR Modifier) must be below the limits of Figure 1310 (Sheets 1 through 3), Figure 1311 (Sheets 1 and 2) and Figure 1312 (Sheets 1 and 2). All the calibration points (A Band through D Band) must be examined relative to the limit lines. A large difference between the calibration points and the limit line can indicate instrumentation or engine problems. Use A Band thrust levels for NH and NL acceptance. Use A Band and B Band thrust levels for EGT acceptance. Calculate the EGT margin to the limit line, the engine is acceptable if the average of the A Band and B Band margins is positive (greater than zero).

(a) Figure 1312 (Sheet 1) and Figure 1312 (Sheet 2) shows two maximum EGT limit curves. The upper EGT limit curve applies in all cases except when an engine is tested immediately following high turbine refurbishment. The lower EGT limit curve is to be used only after a high turbine refurbishment (turbine clearances restored) and before engine has flown with turbine cooling air system on.

(b) The N1 rotor speed limits are shown in Figure 1311 (Sheet 1), Figure 1311 (Sheet 2).

(c) Do an N2 Speed Limit Analysis per the following procedure. Figure 1310 (Sheet 1), Figure 1310 (Sheet 2) and Figure 1310 (Sheet 3) presents the corrected rotor speed limits for engines with SVS 29 N2 BIAS, SVS 29-3 N2 BIAS, or SVS 29-5 N2 BIAS or SVS 29-2 N2 BIAS. Refer to Table 1304 through Table 1306B to determine which SVS N2 limit line to use. Refer to the calculation procedures shown in Figure 1302 (Sheet 2), Item 5. Choose the correct calculation procedure based on the control version that is installed at the time of the test.

NOTE: The EEC incorporates for this engine configuration a fixed SVS 29-5 or a N2 biased stator vane schedules (SVS). For the N2 biased configurations, the schedule closes the HPC variable stator vanes 5 degrees for observed N2 rotor speeds less than 9550 N2 RPM and 9830 N2 RPM for RCC. The SVS transitions linearly to either the original OPEN schedule (SVS 29) or a closed (SVS 29-2) 2 degree schedule (HPC RCC Post SB 72-756 or 72-759) at N2 rpm's above 10250, the SVS 29-5 configuration engines, hold SVS schedule at SVS 29-5 for all N2's. Since the N2 Limit Curve Figure 1310 (Sheet 1), Figure 1310 (Sheet 2) and Figure 1310 (Sheet 3) is based on the original OPEN schedule, an adjustment must be made to the N2 data points before they are compared to this N2 Speed Limit Curve, Figure 1310 (Sheet 1), Figure 1310 (Sheet 2) and Figure 1310 (Sheet 3).

(d) Figure 1310 (Sheet 1, Figure 1310 (Sheet 2) and Figure 1310 (Sheet 3) includes the more restrictive speed limits that are necessary for post SB PW4ENG 72-557 engines, (with redesigned 5th stage compressor blade). For simplicity, the more restrictive limits (if they are different) are to be used for both pre and post SB PW4ENG 72-557 engine configurations.

(e) For an example of a N2 Speed Limit Analysis, see Table 1311A for engines running SVS 29 N2 BIAS or see Table 1311B for engines running SVS 29-3 N2 BIAS or see Table 1311C for engines running SVS 29-5 N2 BIAS. An example of a calculation for an engine running SVS 29 N2 BIAS is shown in Table 1312.

EXAMPLE − PROCEDURE TO DO AN N2 SPEED LIMIT ANALYSIS FOR ENGINES RUNNING WITH SVS 29 N2 BIAS

Step 1. Calculate the Corrected Observed N2:

Corrected Observed N2 = Observed N2/SQRT (THETA T2)

Step 2. Calculate FACTOR (Percent difference in N2, SVS 29−5 deg relative to SVS 29):

FACTOR = 1.11244 − 3.93387 x P4.95Q2 + 2.82184 x $P4.95Q2^2$

Where P4.95Q2 = PT4.95/PT2

Step 3. Calculate N2Rcl (Corrected N2 adjusted to SVS 29−5 deg):

If Observed N2 <= 9550 rpm, N2Rcl = Corrected Observed N2

If 9550 < Observed N2 < 10250

N2Rcl = Corrected Observed N2 x [1 + (FACTOR x [Observed N2−9550])/70000]

If Observed N2 >= 10250 rpm, go to step 4b

Step 4. Calculate N2Rop (Corrected N2 adjusted to SVS 29):

(a) If Observed N2 < 10250 rpm, N2Rop = N2Rcl/(1+ FACTOR/100)

(b) If Observed N2 >= 10250 rpm, N2Rop = Corrected Observed N2

Step 5. Calculate Corrected High Rotor Speed − RPM:

Corrected High Rotor Speed = N2Rop/KHN2 + delta N2 (See Figure 1302, (Sheet 4) NOTE 4)

Where KHN2 is found from Figure 1308.

PROCEDURE FOR CALCULATING CORRECTED HIGH ROTOR SPEED (N2) FOR LIMIT ANALYSIS FOR ENGINES RUNNING WITH SVS 29 N2 BIAS
Table 1311A

EXAMPLE - PROCEDURE TO DO AN N2 SPEED LIMIT ANALYSIS
FOR ENGINES RUNNING WITH SVS 29-3 N2 BIAS

Step 1. Calculate the Corrected Observed N2:

Corrected Observed N2 = Observed N2/SQRT (THETA T2)

Step 2. Calculate FACTOR (Percent difference in N2, SVS 29-5 deg relative to SVS 29):

FACTOR = 1.11244 - 3.93387 x P4.95Q2 + 2.82184 x $P4.95Q2^2$
Where P4.95Q2 = P4.95/P2

Step 3. Calculate N2Rcl (Corrected N2 adjusted to SVS 29-5 deg):

If Observed N2 <= 9550 rpm, N2Rcl = Corrected Observed N2

If 9550 < Observed N2 < 10250

N2Rcl = Corrected Observed N2 x [1 + (FACTOR x 0.4 x [Observed N2-9550])/70000]

If Observed N2 >= 10250 rpm, go to step 4(b)

Step 4. Calculate N2Rop (Corrected N2 adjusted to SVS 29):

(a) If Observed N2 < 10250 rpm, N2Rop = N2Rcl/(1+ FACTOR/100)

(b) If Observed N2 >= 10250 rpm, N2Rop = (Corrected Observed N2) / [1+0.6(Factor)/100]

Step 5. Calculate Corrected High Rotor Speed - RPM:

Corrected High Rotor Speed = N2Rop/KHN2 + delta N2
(See Figure 1302 (Sheet 4) NOTE 4)

Where KHN2 is found from Figure 1308.

PROCEDURE FOR CALCULATING CORRECTED HIGH ROTOR SPEED (N2) FOR
LIMIT ANALYSIS FOR ENGINES RUNNING WITH SVS 29-3 N2 BIAS
Table 1311B

EXAMPLE − PROCEDURE TO DO AN N2 SPEED LIMIT ANALYSIS
FOR ENGINES RUNNING WITH SVS 29−5 N2 BIAS

Step 1. Calculate the Corrected Observed N2:

Corrected Observed N2 = Observed N2/SQRT (THETA T2)

Step 2. Calculate FACTOR (Percent difference in N2, SVS 29−5 deg relative to SVS 29):

FACTOR = 1.11244 − 3.93387 x P4.95Q2 + 2.82184 x P4.95Q2^2
Where P4.95Q2 = P4.95/P2

Step 3. Calculate N2Rop (Corrected N2 adjusted to SVS 29):

N2Rop = (Corrected Observed N2)/(1+ FACTOR/100)

Step 4. Calculate Corrected High Rotor Speed − RPM:

Corrected High Rotor Speed = N2Rop/KHN2 + delta N2
(See Figure 1302 (Sheet 4) NOTE 4)

Where KHN2 is found from Figure 1308.

PROCEDURE FOR CALCULATING CORRECTED HIGH ROTOR SPEED (N2) FOR
LIMIT ANALYSIS FOR ENGINES RUNNING WITH SVS 29−5 N2 BIAS
Table 1311C

EXAMPLE - PROCEDURE TO DO AN N2 SPEED LIMIT ANALYSIS FOR ENGINES RUNNING WITH SVS 29-2 N2 BIAS

Step 1. Calculate the Corrected Observed N2:

Corrected Observed N2 = Observed N2/SQRT (THETA T2)

Step 2. Calculate FACTOR (Percent difference in N2, SVS 29-5 deg relative to SVS 29):

FACTOR = 1.11244 - 3.93387 x P4.95Q2 + 2.82184 x $P4.95Q2^2$
Where P4.95Q2 = P4.95/P2

Step 3. Calculate N2Rcl (Corrected N2 adjusted to SVS 29-5 deg):

If Observed N2 <= 9830 rpm, N2Rcl = Corrected Observed N2

If 9830 < Observed N2 < 10250

N2Rcl = Corrected Observed N2 x [1 + (FACTOR x 0.6 x [Observed N2-9830])/42000]

If Observed N2 >= 10250 rpm, go to step 4(b)

Step 4. Calculate N2Rop (Corrected N2 adjusted to SVS 29):

(a) If Observed N2 < 10250 rpm, N2Rop = N2Rcl/(1+ FACTOR/100)

(b) If Observed N2 >= 10250 rpm, N2Rop = (Corrected Observed N2) / [1+0.4 X (FACTOR)/100]

Step 5. Calculate Corrected High Rotor Speed - RPM:

Corrected High Rotor Speed = N2Rop/KHN2 + delta N2
(See Figure 1302 (Sheet 4) NOTE 4)

Where KHN2 is found from Figure 1308.

PROCEDURE FOR CALCULATING CORRECTED HIGH ROTOR SPEED (N2) FOR LIMIT ANALYSIS FOR ENGINES RUNNING WITH SVS 29-2 N2 BIAS
Table 1311D

EXAMPLE - N2 SPEED LIMIT ANALYSIS - PW4158 (-3) ENGINE RUNNING WITH SVS 29 N2 BIAS

Step 1. Calculate the Corrected Observed N2:

Parameter Point	1	2	3	4

EXAMPLE - N2 SPEED LIMIT ANALYSIS - PW4158 (-3) ENGINE
Table 1312

R. Procedures Necessary After Testing

(1) Oil consumption.

NOTE: When you do the visual inspection for leaks, it is possible to see a small quantity of remaining oil in the area of the spinner, at the bottom of the fan case, or at the HPC variable vane attach bolts at the bottom of the engine. The source of this oil is either the No. 1 bearing carbon seal assembly or the No. 2 bearing rear carbon seal assembly. After the engine windmills or after a long start procedure (conditions where carbon seal pressure differences are very low or negative), a small quantity of oil can get through the carbon seals and go to the external parts of the engine. This condition is satisfactory and is permitted. All other conditions of the inspection must be satisfactory. A limit for the quantity of oil that is permitted is not given. The limits that should be used when you make an estimate of the quantity of oil is oil consumption level.

(a) Between 10 and 15 minutes after engine shutdown, fill the oil tank manually as shown in the procedures of 72-00-00 Servicing-02 (Task 72-00-00-610-002) or 72-00-00 Servicing-03 (Task 72-00-00-610-003). Use a graduated measuring device and make a record of the quantity of engine oil that is added.

(b) Make a record of the engine oil consumption in gal/hr (l/hr) in the engine logs.

(c) If there is more oil in the oil tank after the Acceptance Test than before (such as oil that comes out the scupper drain), the oil must be checked for fuel by a laboratory.

(2) Seal Leakage Limits.

(a) Measure the quantity of leakage in each seal drain collection bottle. The leakage limits for each seal drain are shown in 71-00-00 Power Plant General - Testing-00, Engine Operation Limits, (Task 71-00-00-990-007).

(3) Check Filters.

(a) Remove the main oil filter and seals. Examine the filter for pieces of unwanted material (chips) and contamination. Record the results in the engine logs. Install a new main oil filter and seals.

(b) Remove the fuel filters and seals. Examine the filter for pieces of unwanted material (chips) and contamination. Record the results in the engine logs. Install new fuel filters and seals.

R 1 Look for bronze colored particles. If you find
R bronze contamination, you must replace the fuel
R metering unit and the fuel pump.

(4) Preservation.

(a) For engine preservation refer to 72−00−00, Storage/Transport−03, Accomplish Engine Preservation, (Task 72−00−00−620−001).

CORRECTION OF OBSERVED READINGS (SHEET 1 OF 4)

NOTE: For the Following Calculations:

- THETA T2 $= \theta T2 = \left(\frac{TT2\,^{\circ}C + 273.16}{288.16} \right)$
- DELTA T2 $= \delta T2 = \frac{PT2\ (IHGA)}{29.92}$
- Note 1 through Note 11 ..... See Sheet 4 Definitions

Item (1) Corrected Net Thrust – lbs

$$\frac{Total\ (FN)}{\delta T2} = \left(\frac{Observed\ Thrust}{\delta T2} \right) + Delta\ FN_{Note\ 1}$$

Item (2) Corrected Fuel Flow – lbs/hr

$$\frac{WF}{(\delta T2)\ (KC)\ (KHWF)} = \left(\frac{Observed\ Fuel\ Flow}{(\delta T2)\ (KC)\ (KHWF)} \right) \times \left(\frac{LHV}{18400} \right) + Delta\ WF_{Note\ 2}$$

KC is defined as $(\theta T2)^{0.59}$

KHWF is determined as follows:

(a) Obtain a value of KH' (min) which is a function of specific humidity (lbs moisture per lb of dry air) from Figure 1307. This value is a minimum correction and will be compared with that obtained in the following step.

(b) Using recorded ambient temperature and Corrected Net Thrust from Item (1) above, obtain values of C1 (Figure 1305), C2, and C3 (Figure 1306). Calculate KH' using the following equation:

$KH' = C1(SH + C2) + C3$, where SH = specific humidity (lbs moisture/lb dry air)

(c) Set KHWF equal to the greater of the values of KH' calculated above in Item (2) (a) and (b).

(d) LHV = Lower Heating Value of fuel in BTU/LBM.

Task 71−00−00−760−060:

1. Test No. 9 − Engine Acceptance Test

A. Prerequisite Procedure

CAUTION: ENGINE CONFIGURATION IDENTIFIER MUST BE CAREFULLY DETERMINED. FAILURE TO CORRECTLY IDENTIFY CONFIGURATION COULD RESULT IN RED LINE EXCEEDANCE AND/OR THRUST SHORTFALL

(1) Use Table 1301 to get the necessary Testing−09 configuration. Get the engine configuration from the engine identification data plate. Look for a configuration identification suffix marked after the engine model in the model field.

(a) EXAMPLE 1:

1 If "PW4158 (−3)" is marked on the engine identification plate, the configuration identifier suffix is "(−3)". This corresponds to a Phase 3 configuration as specified in Table 1301. Use TESTING−09, CONFIG−2 to do the acceptance test.

(b) EXAMPLE 2:

1 If "PW4158" is marked on the engine identification plate with no configuration identifier suffix, the configuration is Pre Phase 3 as specified in Table 1301. Use TESTING−09, CONFIG−1 to do the acceptance test.

(c) EXAMPLE 3:

1 If "PW4158 (−1C/−1E)" is marked on the engine identification plate, the configuration identifier suffix is "(−1C/−1E)". This corresponds to a Pre Phase−3 engine with a FB2C (Phase−3) fan installed by SB PW4ENG 72−516.

TESTING−09 CONFIGURATION	ENGINE CONFIGURATION	CONFIGURATION IDENTIFICATION SUFFIX
Config−1	Pre Phase 3	None

TESTING−09 CONFIG/ENGINE CONFIGURATION
Table 1301

TESTING-09 CONFIGURATION	ENGINE CONFIGURATION	CONFIGURATION IDENTIFICATION SUFFIX
Config-2	Phase 3 (Reference SB PW4ENG 72-572)	(-3)
Config-3	Intermix (-1C or -1E) (Reference SB PW4ENG 72-516)	(-1C/-1E)
Config-4	NOT AVAILABLE for Airbus installations	
Config-5	Intermix (-3A) (Reference SB PW4ENG 73-150)	(-3A)

TESTING-09 CONFIG/ENGINE CONFIGURATION
Table 1301 (Continued)

(2) Use this procedure to test the engine for satisfactory performance after one or more components or modules have been replaced or repaired. This test is also used after the engine was fully disassembled, repaired and assembled.

NOTE: It is recommended that you not install large quantities of blended blades, vanes and airseals in one engine. If these parts are blended to the maximum limits in many areas, the result will be low engine performance.

(3) It is possible that other tests are necessary before you do this test, see 71-00-00 Power Plant General - Testing-00, Test Requirements After Engine/Module/Component Repair or Replacement, Task 71-00-00-990-003. This procedure will also give the sequence for the necessary tests.

(4) Special instrumentation must be installed on the engine before the engine is operated for this test.

(5) The engine testing must be done in a test configuration and test cell that has been calibrated. Calibrate to the specifications shown in P&W Publication Report No. 544. All test data must be corrected to the special test cell correction factors before you use the limits and curves in this procedure.

(6) For general safety information, see 71-00-00, Power Plant General - Testing-00, Engine Safety Precautions, Task 71-00-00-990-004.

(7) For safe engine operation, see 71-00-00, Power Plant General - Testing-00, Precautions And Procedures For Safe And Correct Engine Operation, Task 71-00-00-760-002.

(8) For engine operation limits, see 71-00-00, Power Plant General - Testing-00, Engine Operation Limits, Task 71-00-00-990-007.

B. Equipment And Materials Necessary

Standard Tools (See 71-00-00, Power Plant General - Testing-00, Prepare The Engine For Test In A Cell, Task 71-00-00-480-001

(1) Fuel pump drain hose and collection bottle.

(2) Stator vane drain hose and collection bottle.

(3) Station 2.5 compressor bleed actuator drain hose and collection bottle.

(4) Air/oil cooler modulating valve drain hose and collection bottle.

(5) IDG air/oil cooler modulating valve drain hose and collection bottle.

(6) TCC actuator modulating valve drain hose and collection bottle.

(7) Accessory drive fluid power pump drain hose and collection bottle.

(8) Starter drive drain hose and collection bottle.

(9) IDG drain hose and collection bottle.

(10) Accessory drive EEC generator seal drain hose and collection bottle.

(11) Fuel/oil heat exchanger IDGS core drain hose and collection bottle.

(12) Fuel/oil heat exchanger engine oil core drain hose and collection bottle.

(13) Fuel/oil heat exchanger IDG center tube drain hose and collection bottle.

(14) Bypass valve drain hose and collection bottle.

(15) Hydraulic pump drain hose and collection bottle.

C. Test Instrumentation And Test Cell Connections.
Install the special instrumentation and equipment that follows:

(1) PT2 and PS2 (8 locations) − (optional)

(2) PT2/TT2 Rosemount probe − (PWA 85523)

(3) TT2 − Compressor inlet total temperature (8 locations)

(4) Fuel flow (observed)

(5) T Fuel

(6) N1 RPM − (NL)

(7) N2 RPM − (NH)

(8) PT2.5*

(9) PS3

(10) PS4I (Optional)

(11) PT4.95

(12) Main Oil Pressure

(13) Main Oil Temperature

(14) Oil Filter Differential Pressure

(15) Fuel Pump Inlet Pressure

(16) Fuel Pump Pressure

(17) PAMB

(18) TT2.5*

(19) TT3*

(20) Vibration, fan case flange A (vertical)

(21) TT4.95 Harness Average (stand reading) If EEC T49 value is used, adjustment to T4.95 (real without shunt) must be made.

(22) Thrust - (observed)

(23) Thrust Lever and Fuel Select Switch

(24) Ignition Switch

(25) Test Cell Fuel Supply Pressure

(26) ARINC 429 transceiver.

(27) No. 3 Bearing Compartment Breather Pressure

* - A necessary parameter for the module analysis program MAPNET System. Optional unless a MAPNET System analysis is necessary.

D. Thrust Rating and Operation Limits

(1) Ratings at static sea level standard conditions are shown in Table 1302.

ENGINE MODEL	THRUST SETTING	JET THRUST LBS. (N)	TSFC *
PW4152 (-1C/-1E)	TAKEOFF	51110 (227348)	0.3390
PW4152 (-1C/-1E)	MAX CONTINUOUS	47160 (209778)	0.3320
PW4152 (-1C/-1E)	90% Max. Continuous	42450 (188827)	0.3254
PW4152 (-1C/-1E)	70% Max. Continuous	34200 (152129)	0.3188
PW4156A (-1C/-1E)	TAKEOFF	55950 (248878)	0.3495
PW4156A (-1C/-1E)	91% TAKEOFF	51000 (226859)	0.3388
PW4156A (-1C/-1E)	MAX CONTINUOUS	45730 (203417)	0.3298
PW4156A (-1C/-1E)	90% MAX CONTINUOUS	40940 (182110)	0.3237

THRUST AND TSFC RATINGS AT SEAL LEVEL STANDARD CONDITIONS
Table 1302

ENGINE MODEL	THRUST SETTING	JET THRUST LBS. (N)	TSFC *
PW4158 (-1C/-1E)	TAKEOFF	57610 (256262)	0.3536
PW4158 (-1C/-1E)	88% TAKEOFF	51000 (226859)	0.3388
PW4158 (-1C/-1E)	MAX CONTINUOUS	45490 (202349)	0.3295
PW4158 (-1C/-1E)	90% MAX CONTINUOUS	40770 (181354)	0.3236

*NOTE: TSFC (Thrust Specific Fuel Consumption) is for reference only for a new engine and is not necessary for the engine Acceptance Test.

THRUST AND TSFC RATINGS AT SEAL LEVEL STANDARD CONDITIONS
Table 1302 (Continued)

(2) The engine speed limits are shown in 71-00-00, Power Plant General - Testing-00, Engine Operation Limits, Task 71-00-00-990-007.

(3) The engine exhaust gas temperature (EGT) limits for Station 4.9 are shown in 71-00-00, Power Plant General - Testing-00, Engine Operation Limits, Task 71-00-00-990-007.

E. Seal Drain Leakage Limits

(1) During the Acceptance Test, the seal leakage must be measured. See 71-00-00, Power Plant General - Testing-00, Engine Operation Limits, Task 71-00-00-990-007.

(2) Attach a hose to each seal drain connection and put the other end of the hose in a collection bottle. Each bottle must be identified.

F. Multi-Point Instrumentation

(1) Multi-point instrumentation is necessary and is measured during the acceptance test for some parameters. To get satisfactory data, there is a limit for sampling points that do not operate. The necessary multi-point instrumentation and points that do not operate are listed as follows:

(a) TT2 − Eight sampling points are necessary with a maximum limit of two points that do not operate.

(b) Bellmouth pitot static probes (PT2 and PS2) − This parameter is optional. If it is used, eight sampling points are necessary with a maximum limit of two points that do not operate.

(c) Pitot static probes must be installed for test cell correlation testing. See the specifications shown in P&W publication Report No. 544.

(d) PT2 can be calculated for post test cell correlation testing without pitot static probes. Do a correlation of PT2 (pitot static) to: PT2 Rosemount probe, P cell or (PT2/Pamb vs N1 corrected).

G. Acceptance Test General Specifications

(1) Use the definitions that follow during the acceptance test.

(a) EPR−0 = Engine Pressure Ratio from the EEC (Electronic Engine Control) instrumentation system with a zero delta EPR modified (Class 09) Engine Program Plug (EPP) installed in the Electronic Engine Control (EEC).

OR

EPR−0 can be calculated by adding the necessary EPR Modification (delta EPR) used during the test run to the EPR output from the Engine Control (Engine Electronic Control EPR therefore EECEPR).

In the Airbus Engine Control logic EPR modification (delta EPR) is a function of TRA (throttle lever resolver angle). To correctly calculate EPR−0 from EECEPR, EPR class and TRA are necessary.

The Control logic removes the EPR modification (delta EPR) at low power to align the right and left wing engines. This logic is unique to Airbus installations and controls because it occurs in sea level test range, (below "C" band point when the TRA is less than 72 degrees).

Calculation of EPR-0. Because the recommended test configuration is with a class 16/ -0.028 delta EPR modifier, the calculation is shown as follows:

EECEPR = EPR-028

If TRA is equal or greater than 72 degrees,
EPR-0 = EPR-028 + .028

If TRA is between 40.5 and 72 degrees,
EPR-0 = EPR-028 + (1-(72-TRA)/31.5) x .028

If TRA is equal or less than 40.5 degrees,
EPR-0 = EPR-028

For other EPR class modifiers (other than class 16), see Table 1303 for values.

(b) EPR-028 = Engine Pressure Ratio form the EEC (Electronic Engine Control) instrumentation system with a class 16 (-0.028 delta) EPR modifier Engine Programming Plug (EPP) installed in the EEC.

(c) EPR = Engine Pressure Ratio From the EEC (Electronic Engine Control) instrumentation system with a class EEC programming plug to be calculated. To calculate EPR, (EPR-0 + delta EPR modifier). EPR is the value used in Paragraph Q. Check For Engine Acceptance to check for engine acceptance and to calculate engine margin to the limits.

(d) TRA = Throttle Resolver Angle, position of the EEC thrust control lever as specified by the electrical signal from the EEC.

EPR CLASS	EPR MODIFICATION (DELTA EPR)
01	+ .032
02	+ .028
03	+ .024
04	+ .020
05	+ .016
06	+ .012
07	+ .008

EEC PROGRAMMING PLUG (EPP) CLASSIFICATION
Table 1303

EPR CLASS	EPR MODIFICATION (DELTA EPR)
(CONTINUED)	
08	+ .004
09	0.0
10	- .004
11	- .008
12	- .012
13	- .016
14	- .020
15	- .024
16	- .028

EEC PROGRAMMING PLUG (EPP) CLASSIFICATION
Table 1303 (Continued)

(2) All Acceptance Test specifications are from the test cell instrumentation except the EPR (Engine Pressure Ratio) which is the EPR value from the EEC. The EEC values for Tt2, N1, N2 can be used if it is shown they are consistent and equal to the stand readings. This must be done during the test cell correlation testing. The EEC values must be within the limits and tolerances of 71-00-00 Testing-00 Table 1305 of Test Instrumentation Calibration (Task 71-00-00-990-002). Any exceptions to this rule will be specified in the test procedure or correction to the observed section.

CAUTION: IF YOU USE AN INCORRECT EPP PLUG DURING ENGINE TEST, YOU WILL CAUSE ERRORS IN SETTING THE EPR RATING CLASSIFICATION AND IN DETERMINING ENGINE ACCEPTANCE TO LIMITS OF PARAGRAPHS Q. AND R. RESPECTIVELY.

(3) For standardization for all PW4000 engine models and to make sure that the engine will make Takeoff thrust, it is recommended that the Acceptance Testing be done with a class 16 EEC Programming Plug (EPP) installed in the EEC. Refer to SB PW4ENG 73-203 for EEC Programming Plug (EPP) part number for testing.

(4) After the Acceptance Test, the necessary class and part number of EEC programming plug must be selected. You must calculate the necessary class and get the part number from SB PW4ENG 73-203. After you select the necessary EEC programming plug, install it in the EEC. See the Component Maintenance Manual (CMM), - EEC Data Entry Plug, PN 50A450. This manual has the procedure for setting the plug classification.

(5) The EEC has logic for operation in two modes:

(a) EPR = This is the primary mode.

(b) N1 = This is the alternate mode which is the backup mode (default) for the EPR mode.

(c) The Acceptance Test must be done in the EPR mode.

POWER PLANT GENERAL - TESTING-09

H. Procedures To Prepare For Test

(1) Check that all the test instrumentation is calibrated and that there are no leaks.

(2) Service the engine oil system as shown in the procedures of 72-00-00 Servicing-02 (Task 72-00-00-610-002) or 72-00-00 Servicing-03 (Task 72-00-00-610-003).

(3) Prime the engine. See 71-00-00 Power Plant General-00, Oil and Fuel Systems Priming Procedure, (Task 71-00-00-760-003).

(4) Do the EEC static test. See 71-00-00 Test No. 7 - EEC Static Test, (Task 71-00-00-760-038).

I. Testing Prior to Acceptance Test

(1) Do the EEC idle test. See 71-00-00 Test No. 6 - EEC Idle Test, (Task 71-00-00-760-037).

NOTE: Start the engine with one Igniter A only.

(2) Do the idle leak test. See 71-00-00 Test No. 3 - Idle Power Test, (Task 71-00-00-760-030). Check for leaks, if necessary do an engine shutdown and repair any leaks.

NOTE: You can do Test No. 6 and 3 at the same time.

(3) Let the engine become stable for five minutes at MINIMUM IDLE.

(4) Make sure all the engine parameters are in the permitted limits. See Power Plant General - Testing-00, Engine Operation Limits, (Task 71-00-00-990-007).

  (a) Make sure that the main oil pressure is in limits. The oil pressure must also be in the acceptance band shown in 71-00-00, Test No. 13, (Task 71-00-00-760-047).

  (b) Make sure that the No. 1 - 2 bearing compartment breather pressure is in limits.

  (c) Make sure that the No. 3 bearing compartment breather pressure is in limits.

(d) Make sure that the No. 3 bearing compartment scavenge temperature (T3 SCAV) is in limits.

(e) If the optional PS4I instrumentation is installed, make sure that the turbine cooling air pressure ratio (TCAR) is in the operator's historical range.

NOTE: The turbine cooling air ratio (TCAR) check is removed from all PW4000 engine manuals. Field experience shows that the assembly instructions and TOBI flow checks are sufficient to make sure that the engine will operate correctly. You must obey the assembly and check procedures specified in the engine manual and service bulletins.

(5) Make a record of N1 RPM, N2 RPM, T4.95 (EGT), oil pressure and temperature. Check the EEC for fault messages.

NOTE: It is recommended that a complete set of data be taken at this time to check the data system. The data system must be checked before the Engine Acceptance Test.

(6) Do an engine shutdown by the Normal Shutdown Procedure, (Task 71-00-00-760-005).

(7) Check the EEC status for fault messages. Do any maintenance that is necessary.

(8) Between 5 and 35 minutes after shutdown, fill the oil tank manually as shown in the procedures of 72-00-00 Servicing-02 (Task 72-00-00-610-002) or 72-00-00 Servicing-03 (Task 72-00-00-610-003). This oil fill step will be used to calculate the engine oil consumption. The oil consumption will be calculated in gallons per hour after the Acceptance Test.

NOTE: Do not use a remote engine oil fill system during the Acceptance Test. You must not add engine oil during the Acceptance Test.

J. Acceptance Test Data Records

(1) Make a record on the engine log sheet of the general information and data as follows:

(a) Date of the Acceptance Test.

(b) Engine serial number.

(c) Serial number of modules and major components.

(d) Fuel grade and specific gravity.

(e) Engine oil specification and brand.

(f) Ambient atmospheric conditions (true barometer, wet and dry bulb temperatures).

(g) Total time of the Acceptance Test.

(h) Reasons for any engine shutdowns that are not on the schedule.

(i) Any repairs that were necessary during the Acceptance Test.

(j) If it is applicable, the reason the engine was rejected after the Acceptance Test.

(k) The test operator must sign the engine log.

(l) The test inspector must sign the log.

(2) Make a record of the engine parameters shown in Paragraph C. "Test Instrumentation And Test Cell Connections", during the Acceptance Test. Make a record at each thrust lever position during the test, (except oil consumption).

K. Initial Running

NOTE: The INITIAL RUNNING is for the LPC/HPC break−in cycle and is only necessary if the LPC or HPC or both were replaced, repaired or are new. If the LPC/HPC break−in cycle is not necessary, go to the next testing step, Engine Acceptance Test.

(1) Start the engine by the Engine Start Procedure (Normal), (Task 71−00−00−760−004). Start engine using Igniter B. Determine and record overall time from pressurization until MINIMUM IDLE speed is reached. Record data after five minutes at MINIMUM IDLE.

(a) Record data for all stabilized test points prior to moving thrust lever to the next requirement.

(b) Verify that the main oil pressure and the No. 3 bearing compartment breather pressure are within the limits shown under Testing-00, Operating Limits, (Task 71-00-00-990-007).

(c) If the optional PS4I instrumentation is installed, make sure that the turbine cooling air pressure ratio (TCAR) is in the operator's historical range.

(d) Check EEC status and maintenance words for faults. See 71-00-00, Fault Isolation-00 (Task 71-00-00-810-001).

(2) The acceleration in this section is to be done with reverse TRA. Verify in simulated deployed position that the 2.5 bleed is 100 percent open (88 percent of actuator stroke) throughout reverse operation.

CAUTION: IF AN ENGINE STALL OCCURS DURING THIS TEST, YOU MUST MOVE THE THRUST LEVER TO MINIMUM IDLE WITHIN ONE SECOND OF THE STALL. DO THE PROCEDURES SHOWN IN TESTING-00 "PROCEDURE AFTER ENGINE SURGE OR STALL" (TASK 71-00-00-760-009) AND DO THE "START PROCEDURE AFTER AN EMERGENCY SHUTDOWN" (TASK 71-00-00-760-006). IF YOU DO NOT DO THESE PROCEDURES, YOU CAN DAMAGE THE TURBINE TIP SEALS.

(a) Make a slow acceleration (30 - 60 seconds) to 8000 N2. Stabilize for two minutes at 8000 N2. Record data at the end of the stabilization period.

(b) Continue slow acceleration to 8500 N2. Stabilize for two minutes at 8500 N2. Record data at the end of the stabilization period.

(c) Continue slow acceleration to 8800 N2. Stabilize for two minutes at 8800 N2. Record data at the end of the stabilization period.

(d) Continue slow acceleration to 9000 N2. Stabilize for two minutes at 9000 N2. Record data at the end of the stabilization period.

NOTE: At cold inlet temperature maximum reverse scheduling (fN1C), may restrict the engine from achieving 9000 rpm target.

(e) Continue slow acceleration to max reverse TRA. Stabilize for five minutes at fixed TRA. Record data at the end of the stabilization period.

NOTE: At low inlet temperatures, high N2 speeds may result in high thrusts. DO NOT EXCEED 50000 LBS FN/ST2.

(f) Make a slow deceleration (30 - 60 seconds) to MINIMUM IDLE. Stabilize at MINIMUM IDLE for 0 - 30 seconds. Take the engine out of the simulated reverse position.

(g) Continue normal acceptance running.

L. Engine Acceptance Test (to be run following initial break in running for refurbished engines and all other engines).

(1) The Acceptance Testing-09 cycle is shown in the Engine Run Schedule, Figure 1301.

(2) Start the engine by the Engine Start Procedure (Normal), (Task 71-00-00-760-004).

NOTE: Start the engine with one Igniter B only.

NOTE: Monitor the main oil pressure, (MOP), during the start procedure. If you do not see any oil pressure, you must immediately and quickly stop the start procedure.

(3) Make a record of the time from fuel pressurization to MINIMUM IDLE speed.

(4) Let the engine become stable at MINIMUM IDLE.

(5) Make sure all the engine parameters are in the permitted limits. See Power Plant General - Testing-00, Engine Operation Limits, (Task 71-00-00-990-007).

(6) Operate the engine at MINIMUM IDLE for five minutes.

(7) If the optional PS4I instrumentation is installed, make sure that the turbine cooling air pressure ratio (TCAR) is in the operator's historical range.

(8) Check EEC status and maintenance words for faults. See 71-00-00, Fault Isolation-00 (Task 71-00-00-810-001).

(9) Continue slow acceleration (90 - 120 seconds) from MINIMUM IDLE to the thrust of Band A shown in Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3). Stabilize for three minutes. Record data and install TRA stop.

(10) Do the decel vibration survey as follows.

CAUTION: IF AN ENGINE STALL OCCURS DURING THIS TEST, YOU MUST MOVE THE THRUST LEVER TO MINIMUM IDLE WITHIN ONE SECOND OF THE STALL. DO THE PROCEDURES SHOWN IN TESTING-00 "PROCEDURE AFTER ENGINE SURGE OR STALL" (TASK 71-00-00-760-009) AND DO THE "START PROCEDURE AFTER AN EMERGENCY SHUTDOWN" (TASK 71-00-00-760-006). IF YOU DO NOT DO THESE PROCEDURES, YOU CAN DAMAGE THE TURBINE TIP SEALS.

(a) Make a slow deceleration (60 - 120 seconds) to MINIMUM IDLE, surveying engine vibration.

(b) At each speed where peaks have shown during the deceleration, record the mean vibration level of each pickup after 30 second stabilization.

(c) Check that the engine vibration values are in the permitted limits. See Testing-00, Engine Operation Limits, (Task 71-00-00-990-007).

(d) For engines that are more than the permitted vibration limits, do Testing-19, Trim Balance Procedure And Test, (Task 71-00-00-760-043), (Task 71-00-00-760-052) or (Task 71-00-00-760-057).

(11) Select APPROACH IDLE. Stabilize for 15 minutes. At the end of the stabilization period, record data.

(12) Do the snap acceleration/deceleration test cycle shown in 71-00-00, Testing-04 (Task 71-00-00-760-031) and perform step B.(9)(b) through B.(9)(i) for acceleration/deceleration test). Also see Engine Run Schedule shown in Figure 1301.

NOTE: The snap acceleration/deceleration must be done after the compressor break in cycle shown in above.

(13) Vibration Survey (Acceleration).

(a) An engine vibration survey shall be conducted on an engine that has been thermally stabilized. Completion of step M.(12) above without shutdown will result in a stabilized engine. If shutdown occurs, the engine must be run at thrust Band C, Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3) or higher for three minutes and then run for six minutes at MINIMUM IDLE prior to conducting the vibration survey.

(b) Make a slow acceleration (90 - 120 seconds) from MINIMUM IDLE to thrust Band A Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3).

(c) At each speed where peaks have shown during the acceleration, record the mean vibration level of each pickup after 30 second stabilization.

(d) Check the engine vibration levels during this test to make sure that the allowable limits are not exceeded. See 71-00-00, Testing-00, Vibration Limits, (Task 71-00-00-990-007).

(e) For engines that exceed the vibration limits, see 71-00-00, Testing-19, (Task 71-00-00-760-043), (Task 71-00-00-760-052) or (Task 71-00-00-760-057).

(14) Performance Calibration.

(a) Stabilize at thrust Band A Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3) for five minutes. At the end of the stabilization period, record data.

(b) Stabilize at thrust Band B Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3) for three minutes. At the end of the stabilization period, record data.

(c) Stabilize at thrust Band C Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3) for three minutes. At the end of the stabilization period, record data.

(d) Stabilize at thrust Band D Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3) for three minutes. At the end of the stabilization period, record data.

(e) Decelerate slowly (60 - 120 seconds) to APPROACH IDLE. Stabilize for 20 minutes.

(15) Engine shutdown procedure.

(a) Do an engine shutdown by the Normal Shutdown Procedure, (Task 71-00-00-760-005).

(b) Check the EEC status for fault messages. Do any maintenance that is necessary.

M. Procedures After Engine Shutdown - Corrections Of Observed Readings.

(1) Correct the observed data collected in thrust Bands A, B, C, and D of the performance calibration. Use the procedure defined in Figure 1302 (Sheet 1), Figure 1302 (Sheet 2), Figure 1302 (Sheet 3) and Figure 1302 (Sheet 4).

N. Engine Configuration Determination

(1) Based on the engine configuration identifier suffix in Table 1301, make sure that you are in the appropriate Testing-09 CONFIG section to use to class and check the engine for acceptance.

O. Check Corrected Data

(1) If the optional PS4I instrumentation is installed, make sure that the turbine cooling air pressure ratio (TCAR) is in the operator's historical range.

(2) Values of Corrected Net Thrust versus PT4.95/PT2 corrected N1, corrected N2, and corrected EGT, should fall within the requirements of Figure 1309 (Sheet 1), Figure 1309 (Sheet 2), Figure 1309 (Sheet 3), and Figure 1309 (Sheet 4). The lines on these figures are guidelines only and are not acceptance limits. Points outside these values can suggest that there is a instrumentation and/or other problem that must be identified.

(a) Definitions of terms used in Figure 1309 are as follows:

(b) Complete Refurbishment: Bands are for engines that had all modules repaired or replaced to new engine clearances and airfoil condition.

(c) Minor or No Refurbishment: Bands are for high time service engines that are fully deteriorated without any or only a small quantity of gaspath repair.

(3) Values of corrected PT2.5/PT2 and PS3/PT2.5 versus PT4.95/PT2 should fall within the guidelines of Figure 1309 (Sheet 5) and Figure 1309 (Sheet 6). The lines of these figures are guidelines only and not acceptance limits. Points outside these values can suggest that there is a instrumentation and/or other problem that must be identified.

(4) If a review of the test high power (points generally above 52000 lbf (231307.5 N) thrust, or 1.45 PT4.95/PT2) indicate a change in level relative to the check line shape as shown in Table 1307 below, this can be an indication of abnormal fan operation. This abnormal operation is also accompanied by a noticeable tone change in the engine. This change is triggered at high power by dirty and/or severely eroded fan blade leading edges. Corrective action must be taken. Refer to 72-00-31, Repair-01 (Task 72-00-31-300-001).

(5) Corrected Thrust Specific Fuel Consumption (TSFC) must be compared with the values listed in Table 1302. These values are included for reference to new engine levels only and are not intended as an acceptance requirement.

ABNORMAL FAN OPERATION		
Delta P4.95/PT2	approximately +0.015 to 0.020	at Fn = K
Delta N1C	approximately +80 to +100 RPM	at Fn = K
Delta N2C	approximately −40 RPM	at Fn = K
Delta EGT	approximately −4°C	at Fn = K
Delta PT2.5/PT2	approximately +0.14 ratios	at P4.95/PT2 = K
Delta PS3/PT2.5	approximately −0.5 ratios	at P4.95/PT2 = K

PARAMETER SHIFT WITH ABNORMAL FAN OPERATION
Table 1307

P. Engine Pressure Ratio (EPR) Rating Classification

(1) The necessary EEC programming plug is specified by a part number and EPR class system. The programming plug part number is specified by the engine model and thrust rating. For the necessary EEC programming plug part number, see Table 1304, Table 1305, Table 1306. The necessary EPR Class must be selected by Engine Pressure Ratio (EPR), see SB PW4ENG 73−203.

(2) The plug part number and class is shown on the engine data plate. If a new part number or class plug is used, you must write (scribe) the new part number and class on the engine data plate.

(3) Make a EEC programming plug selection as follows:

(a) See SB PW4ENG 73−203 for the necessary Engine Programming Plug (EPP) for the engine model and hardware configuration that was tested. Confirm that the appropriate EPP part number was installed during acceptance testing.

NOTE: If the incorrect program plug (EPP) was installed during acceptance testing, contact Pratt & Whitney for assistance in correcting data/or rerun with the correct program plug.

(b) EPR class modifiers are used to make sure that the engine pressure ratio sent to the aircraft is less than the given limits. This will make sure that the engine will always give rated thrust at all possible take−off settings. The EPR limit is called "MAX EPR" and is shown in Table 1308.

NOTE: A PW4152 (−1C/−1E) engine must only use the Bands A, B, and C points for the EPR Modifier classification. The PW4156A (−1C/−1E) and PW4158 (−1C/−1E) engines can use the Bands A, B, C and D points in the calculations.

(c) Use EPR-0 and Corrected Net Thrust from the four performance calibration points to find the EPR modifier class. Find the EPR modifier class which gives the highest EPR value and does not go more than the MAX EPR LIMIT specified by Table 1308. Make a straight line curve to fit between the points shown on Table 1308.

NOTE: To calculate EPR-0, go to Paragraph G.(1), Acceptance Test General Specifications.

NOTE: Make sure that the Stage 2.5 bleed valve is in the closed location. Do not use any data points (D band point) where the Stage 2.5 bleed valve starts to open to calculate the modifier class.

(d) To calculate EPR, use the EPR class defined above where EPR = EPR-0 + EPR Modifier. EPR is the value used in Paragraph Q. Check For Engine Acceptance, to check for engine acceptance and to calculate engine margin to the limits.

(e) If multiple ratings are desired, testing need only be performed to the highest rating desired and with a 3rd order curve fit of the four point acceptance data, other "A" band rating EPR-0 values can be found for EPR classification purposes as follows:

1 Use the four point acceptance data to find the 3rd order fit of thrust EPR-0.

2 Find the value of EPR-0 at the rating desired (use the minimum band thrust from Figure 1304).

3 Use the value of the EPR-0 and thrust value calculated in step 2 above as the "A band point. Find the EPR class requirement following the procedure outlined the above step (c). (Use the calculated A band point, with B, C, and D band from the data.)

(f) An example of the EPR class calculation (for a PW4158 (-1C/-1E) configuration) is shown in Table 1309.

FOR THESE CONFIGURATIONS: PW4152 (−1C/−1E), PW4156A (−1C/−1E), PW4158 (−1C/−1E)

CORRECTED NET THRUST LBS (N)	MAXIMUM EPR
34000 lbf (151239.5 N)	1.2632
35000 lbf (155687.8 N)	1.2743
36000 lbf (160136.0 N)	1.2854
37000 lbf (164584.2 N)	1.2965
38000 lbf (169032.4 N)	1.3076
39000 lbf (173480.7 N)	1.3189
40000 lbf (177928.9 N)	1.3302
41000 lbf (182377.1 N)	1.3417
42000 lbf (186825.3 N)	1.3534
43000 lbf (191273.5 N)	1.3652
44000 lbf (195721.8 N)	1.3773
45000 lbf (200170.0 N)	1.3896
46000 lbf (204618.2 N)	1.4022
47000 lbf (209066.4 N)	1.4152
48000 lbf (213514.7 N)	1.4285
49000 lbf (217962.9 N)	1.4421
50000 lbf (222411.1 N)	1.4561
51000 lbf (226859.3 N)	1.4706
52000 lbf (231307.5 N)	1.4856
53000 lbf (235755.8 N)	1.5013
54000 lbf (240204.0 N)	1.5175
55000 lbf (244652.2 N)	1.5346
56000 lbf (249100.4 N)	1.5524
57000 lbf (253548.7 N)	1.5710
58000 lbf (257996.9 N)	1.5906
59000 lbf (262445.1 N)	1.6112
60000 lbf (266893.3 N)	1.6328

MAXIMUM EPR
Table 1308

EXAMPLE OF CALCULATING EPR MODIFIER CLASS FOR PW4158 (-1C/-1E) ENGINE CONFIGURATIONS

Step 1.
Start with the four performance calibration points from engine test.

CORRECTED NET THRUST

LBS (N)	(EEC EPR) EPR-028	TLRA	DELTA EPR MOD [SEE PARA. G. (1)]	= EPR-0
58125 lbf (258552.9 N)	1.555	79.8	.028	1.583
51500 lbf (229083.4 N)	1.444	74.2	.028	1.472
46209 lbf (205547.9 N)	1.376	70.1	.026	1.402
41066 lbf (182670.7 N)	1.317	65.7	.022	1.339

Step 2.
At the Corrected Net Thrust level of the four performance calibration points, find the Maximum EPR as shown in Table 1308. Make a straight line curve to fit between the points shown on Table 1308.

CORRECTED NET THRUST

LBS (N)	EPR-MAX
58125 lbf (258552.9 N)	1.5932
51500 lbf (229083.4 N)	1.4781
46209 lbf (205547.9 N)	1.4049
41066 lbf (182670.7 N)	1.3425

Step 3.
Find the delta EPR value for each point of Maximum EPR:

CORRECTED NET THRUST

LBS (N)	EPR-MAX	EPR-0	DELTA EPR

EXAMPLE OF CALCULATING EPR MODIFIER FOR PW4158 (-1C/-1E) ENGINES
Table 1309

EXAMPLE OF CALCULATING EPR MODIFIER CLASS
FOR PW4158 (-1C/-1E) ENGINE CONFIGURATIONS

58125 lbf (258552.9 N)	1.5932	1.583	.0102
51500 lbf (229083.4 N)	1.4781	1.472	.0061
46209 lbf (205547.9 N)	1.4049	1.402	.0029
41066 lbf (182670.7 N)	1.3425	1.339	.0035

Step 4.
To find the EPR Class Number, use the delta EPR value from Step 3. above, and go to Table 1303.

DELTA EPR	CLASS NUMBER	EPR MODIFIER
0.0102	7	+0.008
0.0061	8	+0.004
0.0029	9	+0.000
0.0035	9	+0.000

Step 5.
The EPR Modifier Class 9 will give the highest possible EPR and will not be more than the EPR-Max limit, (highest class number from above). Make a Class 9 modifier selection and then calculate EPR.

EPR-0	EPR MODIFIER	EPR
1.583	0	1.583
1.472	0	1.472
1.402	0	1.402
1.339	0	1.339

EXAMPLE OF CALCULATING EPR MODIFIER FOR PW4158 (-1C/-1E) ENGINES
Table 1309 (Continued)

Q. Check For Engine Acceptance

CAUTION: MAKE SURE THAT THE STAGE 2.5 BLEED VALVE IS IN THE CLOSED LOCATION. DO NOT USE ANY DATA POINTS TO CALCULATE ACCEPTANCE TO THE LIMITS WHERE THE STAGE 2.5 BLEED VALVE STARTS TO OPEN (D BAND POINT).

(1) The steady state values of corrected N2, N1 and TT4.95 (EGT) versus modified engine pressure ratio (EPR = EPR-0 + EPR Modifier) must be below the limits of Figure 1310 (Sheets 1 through 3), Figure 1311 (Sheest 1 and 2) and Figure 1312 (Sheets 1 and 2). All the calibration points (A Band through D Band) must be examined relative to the limit lines. A large difference between the calibration points and the limit line can indicate instrumentation or engine problems. Use A Band thrust levels for NH and NL acceptance. Use A Band and B Band thrust levels for EGT acceptance. Calculate the EGT margin to the limit line, the engine is acceptable if the average of the A Band and B Band margins is positive (greater than zero).

(a) Figure 1312 (Sheet 1) and Figure 1312 (Sheet 2) shows two maximum EGT limit curves. The upper EGT limit curve applies in all cases except when an engine is tested immediately following high turbine refurbishment. The lower EGT limit curve is to be used only after a high turbine refurbishment (turbine clearances restored) and before engine has flown with turbine cooling air system on.

(b) The N1 rotor speed limits are shown in Figure 1311 (Sheet 1), Figure 1311 (Sheet 2).

(c) Do an N2 Speed Limit Analysis. Figure 1310 (Sheet 1), Figure 1310 (Sheet 2) and Figure 1310 (Sheet 3) presents the corrected rotor speed limits for engines with either SVS 29 N2 BIAS or SVS 29-2 N2 BIAS. Refer to Table 1304 through Table 1306 to determine which SVS N2 limit line to use. Refer to the calculation procedures shown in Figure 1302 (Sheet 2), Item 5. Choose the correct calculation procedure based on the control version that is installed at the time of the test.

NOTE: The EEC incorporates a N2 biased stator vane schedule (SVS). This schedule closes the HPC variable stator vanes 5 degrees for observed N2 rotor speeds less than 9550 N2 RPM, and 9830 N2 RPM for RCC. The SVS transitions linearly to either the original OPEN schedule (SVS 29) or a closed (SVS 29-2) 2 degree schedule (HPC RCC post SB 72-756) at N2 rpm's above 10250. Since the N2 Limit Curve Figure 1310 (Sheet 1), Figure 1310 (Sheet 2) is based on the original OPEN schedule, an adjustment must be made to the N2 data points before they are compared to this N2 Speed Limit Curve, Figure 1310 (Sheet 1), Figure 1310 (Sheet 2) and Figure 1310 (Sheet 3).

(d) Figure 1310 (Sheet 1), Figure 1310 (Sheet 2) and Figure 1310 (Sheet 3) includes the more restrictive speed limits that are necessary for post SB PW4ENG 72-557 engines, (with redesigned 5th stage compressor blade). For simplicity, the more restrictive limits (if they are different) are to be used for both pre and post SB PW4ENG 72-557 engine configurations.

(e) For an example of a N2 Speed Limit Analysis, see Table 1310A for engines running SVS 29 N2 BIAS or see Table 1310B for engines running SVS 29-3 N2 BIAS. An example of a calculation for an engine running SVS 29 N2 BIAS is shown in Table 1311.

EXAMPLE - PROCEDURE TO DO AN N2 SPEED LIMIT ANALYSIS FOR ENGINES RUNNING WITH SVS 29 N2 BIAS

Step 1. Calculate the Corrected Observed N2:

Corrected Observed N2 = Observed N2/SQRT (THETA T2)

Step 2. Calculate FACTOR (Percent difference in N2, SVS 29-5 deg relative to SVS 29):

FACTOR = 1.11244 - 3.93387 x P4.95Q2 + 2.82184 x $P4.95Q2^2$

Where P4.95Q2 = PT4.95/PT2

Step 3. Calculate N2Rcl (Corrected N2 adjusted to SVS 29-5 deg):

If Observed N2 <= 9550 rpm, N2Rcl = Corrected Observed N2

If 9550 < Observed N2 < 10250

N2Rcl = Corrected Observed N2 x [1 + (FACTOR x [Observed N2-9550])/70000]

If Observed N2 >= 10250 rpm, go to step 4b

Step 4. Calculate N2Rop (Corrected N2 adjusted to SVS 29):

(a) If Observed N2 < 10250 rpm, N2Rop = N2Rcl/(1+ FACTOR/100)

(b) If Observed N2 >= 10250 rpm, N2Rop = Corrected Observed N2

Step 5. Calculate Corrected High Rotor Speed - RPM:

Corrected High Rotor Speed = N2Rop/KHN2 + delta N2 (See Figure 1302, (Sheet 4) NOTE 4.

Where KHN2 is found from Figure 1308.

PROCEDURE FOR CALCULATING CORRECTED HIGH ROTOR SPEED (N2) FOR LIMIT ANALYSIS FOR ENGINES RUNNING WITH SVS 29 N2 BIAS
Table 1310A

EXAMPLE − PROCEDURE TO DO AN N2 SPEED LIMIT ANALYSIS FOR ENGINES RUNNING WITH SVS 29−3 N2 BIAS

ENGINES RUNNING WITH SVS 29−3 N2 BIAS NOT APPLICABLE TO THIS CONFIGURATION

PROCEDURE FOR CALCULATING CORRECTED HIGH ROTOR SPEED (N2) FOR LIMIT ANALYSIS FOR ENGINES RUNNING WITH SVS 29−3 N2 BIAS
Table 1310B

EXAMPLE − PROCEDURE TO DO AN N2 SPEED LIMIT ANALYSIS FOR ENGINES RUNNING WITH SVS 29−5 N2 BIAS

ENGINES RUNNING WITH SVS 29−5 N2 BIAS NOT APPLICABLE TO THIS CONFIGURATION

PROCEDURE FOR CALCULATING CORRECTED HIGH ROTOR SPEED (N2) FOR LIMIT ANALYSIS FOR ENGINES RUNNING WITH SVS 29−5 N2 BIAS
Table 1310C

EXAMPLE − PROCEDURE TO DO AN N2 SPEED LIMIT ANALYSIS
FOR ENGINES RUNNING WITH SVS 29−2 N2 BIAS

Step 1. Calculate the Corrected Observed N2:

Corrected Observed N2 = Observed N2/SQRT (THETA T2)

Step 2. Calculate FACTOR (Percent difference in N2, SVS 29−5 deg relative to SVS 29):

FACTOR = 1.11244 − 3.93387 x P4.95Q2 + 2.82184 x
P4.95Q2^2 −
Where P4.95Q2 = P4.95/P2

Step 3. Calculate N2Rcl (Corrected N2 adjusted to SVS 29−5 deg):

If Observed N2 <= 9830 rpm, N2Rcl = Corrected Observed N2

If 9830 < Observed N2 < 10250

N2Rcl = Corrected Observed N2 x [1 + (FACTOR x 0.6 x [Observed N2−9830])/42000]

If Observed N2 >= 10250 rpm, go to step 4(b)

Step 4. Calculate N2Rop (Corrected N2 adjusted to SVS 29):

(a) If Observed N2 < 10250 rpm, N2Rop = N2Rcl/(1+ FACTOR/100)

(b) If Observed N2 >= 10250 rpm, N2Rop = (Corrected Observed N2) / [1+0.4 X (FACTOR)/100]

Step 5. Calculate Corrected High Rotor Speed − RPM:

Corrected High Rotor Speed = N2Rop/KHN2 + delta N2
(See Figure 1302 (Sheet 4) NOTE 4.

Where KHN2 is found from Figure 1308 .

PROCEDURE FOR CALCULATING CORRECTED HIGH ROTOR SPEED (N2) FOR
LIMIT ANALYSIS FOR ENGINES RUNNING WITH SVS 29−3 N2 BIAS
Table 1310D

EXAMPLE - N2 SPEED LIMIT ANALYSIS - PW4158 (-1C/-1E) ENGINE RUNNING WITH SVS 29 N2 BIAS

Step 1. Calculate the Corrected Observed N2:

Parameter Point	1	2	3	4
Observed N2	9694	9467	9287	9135
T2, deg R	529.4	529.4	529.4	529.4
Sqrt Theta T2	1.010	1.010	1.010	1.010
Corrected Observed N2	9597	9373	9194	9044
P4.95/P2	1.583	1.472	1.402	1.340
FACTOR	1.956	1.4361	1.1438	0.908
N2Rcl	9636	9373	9194	9044
N2Rop	9450	9240	9090	8951
KHN2	1.0019	1.0019	1.0019	1.0019
N2Rop/KHN2	9432	9222	9072	8934

Corrected High Rotor Speed	9523	9283	9118	8968
EPR	1.583	1.472	1.402	1.339
N2 Speed Limit (See Figure 1310 (Sheet 2)	10029	9686	9462	9270
Margin (RPM)	506	403	344	302

EXAMPLE - N2 SPEED LIMIT ANALYSIS - PW4158 (-1C/-1E) ENGINE
Table 1311

R. Procedures Necessary After Testing

(1) Oil consumption.

NOTE: When you do the visual inspection for leaks, it is possible to see a small quantity of remaining oil in the area of the spinner, at the bottom of the fan case, or at the HPC variable vane attach bolts at the bottom of the engine. The source of this oil is either the No. 1 bearing carbon seal assembly or the No. 2 bearing rear carbon seal assembly. After the engine windmills or after a long start procedure (conditions where carbon seal pressure differences are very low or negative), a small quantity of oil can get through the carbon seals and go to the external parts of the engine. This condition is satisfactory and is permitted. All other conditions of the inspection must be satisfactory. A limit for the quantity of oil that is permitted is not given. The limits that should be used when you make an estimate of the quantity of oil is oil consumption level.

(a) Between 10 and 15 minutes after engine shutdown, fill the oil tank manually as shown in the procedures of 72-00-00 Servicing-02 (Task 72-00-00-610-002) or 72-00-00 Servicing-03 (Task 72-00-00-610-003). Use a graduated measuring device and make a record of the quantity of engine oil that is added.

(b) Make a record of the engine oil consumption in gal/hr (l/hr) in the engine logs.

(c) If there is more oil in the oil tank after the Acceptance Test than before (such as oil that comes out the scupper drain), the oil must be checked for fuel by a laboratory.

(2) Seal Leakage Limits.

(a) Measure the quantity of leakage in each seal drain collection bottle. The leakage limits for each seal drain are shown in 71-00-00 Power Plant General - Testing-00, Engine Operation Limits, (Task 71-00-00-990-007).

(3) Check Filters.

(a) Remove the main oil filter and seals. Examine the filter for pieces of unwanted material (chips) and contamination. Record the results in the engine logs. Install a new main oil filter and seals.

(b) Remove the fuel filters and seals. Examine the filter for pieces of unwanted material (chips) and contamination. Record the results in the engine logs. Install new fuel filters and seals.

R R R 1 Look for bronze colored particles. If you find bronze contamination, you must replace the fuel metering unit and the fuel pump.

(4) Preservation.

(a) For engine preservation refer to 72-00-00, Storage/Transport-03, Accomplish Engine Preservation, (Task 72-00-00-620-001).

CORRECTION OF OBSERVED READINGS (SHEET 1 OF 4)

NOTE: For the Following Calculations:

- THETA T2 = $\theta T2 = \left(\frac{TT2^{o}C + 273.16}{288.16}\right)$
- DELTA T2 = $\delta T2 = \frac{PT2\ (IHGA)}{29.92}$
- Note 1 through Note 11 ..... See Sheet 4 Definitions

Item (1) Corrected Net Thrust − lbs

$$\frac{Total\ (FN)}{\delta T2} = \left(\frac{Observed\ Thrust}{\delta T2}\right) + Delta\ FN_{Note\ 1}$$

Item (2) Corrected Fuel Flow − lbs/hr

$$\frac{WF}{(\delta T2)\ (KC)\ (KHWF)} = \left(\frac{Observed\ Fuel\ Flow}{(\delta T2)\ (KC)\ (KHWF)}\right) \times \left(\frac{LHV}{18400}\right) + Delta\ WF_{Note\ 2}$$

KC is defined as $(\theta T2)^{0.59}$

KHWF is determined as follows:

(a) Obtain a value of KH' (min) which is a function of specific humidity (lbs moisture per lb of dry air) from Figure 1307. This value is a minimum correction and will be compared with that obtained in the following step.

(b) Using recorded ambient temperature and Corrected Net Thrust from Item (1) above, obtain values of C1 (Figure 1305), C2, and C3 (Figure 1306). Calculate KH' using the following equation:

$KH' = C1(SH + C2) + C3$, where SH = specific humidity (lbs moisture/lb dry air)

(c) Set KHWF equal to the greater of the values of KH' calculated above in Item (2) (a) and (b).

(d) LHV = Lower Heating Value of fuel in BTU/LBM.

PW V

Correction Of Observed Data
Figure 1302 (Sheet 1)
(Task 71−00−00−760−060)

CORRECTION OF OBSERVED READINGS (SHEET 2 OF 4)

Item (3) Corrected Thrust Specific Fuel Consumption (TSFC) – lbs/hr/lb

$$\left(\frac{\text{TSFC}}{(\text{KC})\ (\text{KHWF})}\right) = \left(\frac{\text{Corrected Fuel Flow}}{\text{Corrected Net Thrust}}\right) = \left\{\frac{\left[\frac{\text{WF}}{(\delta\text{T2})(\text{KC})(\text{KHWF})}\right]}{\left[\frac{\text{FN}}{\delta\text{T2}}\right]}\right\}$$

Item (4) Corrected Low Rotor Speed – RPM

$$\left[\frac{\text{N1}}{\sqrt{\theta\text{T2}}\ (\text{KHN1})}\right] = \left(\frac{\text{Observed N1}}{\sqrt{\theta\text{T2}}\ (\text{KHN1})}\right) + \text{Delta N1}_{\text{Note 3}}$$

where KHN1 is found from Figure 1308.

Item (5) Corrected High Rotor Speed – RPM

Engines running with SVS 29 N2 BIAS:
See calculation procedure outlined in Table 1310 A.
Engines running with SVS 29-2 N2 BIAS:
See calculation procedure outlined in Table 1310 D.
Note 1: For an example calculation procedure for SVS 29 N2 BIAS configuration see Table 1311.
Note 2: Refer to Tables 1304 through1306 determine which SVS N2 BIAS is used.

Item (6) Corrected Exhaust Gas Temperature (EGT) – °C

$$\left[\frac{\text{TT4.95}^{\circ}\text{C}}{(\theta\text{T2})^{1.0}\quad(\text{KHT4.95})}\right] = \left[\frac{\text{Observed TT4.95}^{\circ}\text{C} + 273.16}{(\theta\text{T2})^{1.0}\quad(\text{KHT4.95})}\right] - (273.16) + \text{Delta TT4.95}_{\text{Note 5}}$$

where KHT4.95 is found from Figure 1308.

Item (7) Corrected Station 3 Temperature – °C

$$\left[\frac{\text{TT3}^{\circ}\text{C}}{(\theta\text{T2})^{0.932}}\right] = \left[\frac{\text{Observed TT3}^{\circ}\text{C} + 273.16}{(\theta\text{T2})^{0.932}}\right] - (273.16) + \text{Delta TT3}_{\text{Note 6}}$$

POWER PLANT GENERAL − TESTING−09

Task 71−00−00−760−062:

1. Test No. 9 − Engine Acceptance Test

A. Test Procedure

(1) Testing−09, CONFIG−4 Is Not Used For Airbus Installations

POWER PLANT GENERAL − TESTING−09

Task 71−00−00−760−063:

1. Test No. 9 − Engine Acceptance Test

A. Prerequisite Procedure

CAUTION: ENGINE CONFIGURATION IDENTIFIER MUST BE CAREFULLY DETERMINED. FAILURE TO CORRECTLY IDENTIFY CONFIGURATION COULD RESULT IN RED LINE EXCEEDANCE AND/OR THRUST SHORTFALL

(1) Use Table 1301 to get the necessary Testing−09 configuration. Get the engine configuration from the engine identification data plate. Look for a configuration identification suffix marked after the engine model in the model field.

(a) EXAMPLE 1:

1 If "PW4158 (−3)" is marked on the engine identification plate, the configuration identifier suffix is "(−3)". This corresponds to a Phase 3 configuration as specified in Table 1301. Use TESTING−09, CONFIG−2 to do the acceptance test.

(b) EXAMPLE 2:

1 If "PW4158" is marked on the engine identification plate with no configuration identifier suffix, the configuration is Pre Phase 3 as specified in Table 1301. Use TESTING−09, CONFIG−1 to do the acceptance test.

(c) EXAMPLE 3:

1 If "PW4158 (−3A)" is marked on the engine identification plate, the configuration identifier suffix is "(−3A)". This corresponds to a Phase−3 configuration engine that is to be installed in a non Phase−3 nacelle. Use TESTING−09, CONFIG−5 to do the acceptance test

TESTING−09 CONFIGURATION	ENGINE CONFIGURATION	CONFIGURATION IDENTIFICATION SUFFIX
Config−1	Pre Phase 3	None

TESTING−09 CONFIG/ENGINE CONFIGURATION
Table 1301

TESTING-09 CONFIGURATION	ENGINE CONFIGURATION	CONFIGURATION IDENTIFICATION SUFFIX
Config-2	Phase 3 (Reference SB PW4ENG 72-572)	(-3)
Config-3	Intermix (-1C or -1E) (Reference SB PW4ENG 72-516)	(-1C/-1E)
Config-4	NOT AVAILABLE for Airbus installations	
Config-5	Intermix (-3A) (Reference SB PW4ENG 73-150)	(-3A)

TESTING-09 CONFIG/ENGINE CONFIGURATION
Table 1301 (Continued)

(2) Use this procedure to test the engine for satisfactory performance after one or more components or modules have been replaced or repaired. This test is also used after the engine was fully disassembled, repaired and assembled.

NOTE: It is recommended that you not install large quantities of blended blades, vanes and airseals in one engine. If these parts are blended to the maximum limits in many areas, the result will be low engine performance.

(3) It is possible that other tests are necessary before you do this test, see 71-00-00 Power Plant General - Testing-00, Test Requirements After Engine/Module/Component Repair or Replacement, Task 71-00-00-990-003. This procedure will also give the sequence for the necessary tests.

(4) Special instrumentation must be installed on the engine before the engine is operated for this test.

(5) The engine testing must be done in a test configuration and test cell that has been calibrated. Calibrate to the specifications shown in P&W Publication Report No. 544. All test data must be corrected to the special test cell correction factors before you use the limits and curves in this procedure.

(6) For general safety information, see 71−00−00, Power Plant General − Testing−00, Engine Safety Precautions, Task 71−00−00−990−004.

(7) For safe engine operation, see 71−00−00, Power Plant General − Testing−00, Precautions And Procedures For Safe And Correct Engine Operation, Task 71−00−00−760−002.

(8) For engine operation limits, see 71−00−00, Power Plant General − Testing−00, Engine Operation Limits, Task 71−00−00−990−007.

B. Equipment And Materials Necessary

Standard Tools (See 71−00−00, Power Plant General − Testing−00, Prepare The Engine For Test In A Cell, Task 71−00−00−480−001

(1) Fuel pump drain hose and collection bottle.

(2) Stator vane drain hose and collection bottle.

(3) Station 2.5 compressor bleed actuator drain hose and collection bottle.

(4) Air/oil cooler modulating valve drain hose and collection bottle.

(5) IDG air/oil cooler modulating valve drain hose and collection bottle.

(6) TCC actuator modulating valve drain hose and collection bottle.

(7) Accessory drive fluid power pump drain hose and collection bottle.

(8) Starter drive drain hose and collection bottle.

(9) IDG drain hose and collection bottle.

(10) Accessory drive EEC generator seal drain hose and collection bottle.

(11) Fuel/oil heat exchanger IDGS core drain hose and collection bottle.

(12) Fuel/oil heat exchanger engine oil core drain hose and collection bottle.

(13) Fuel/oil heat exchanger IDG center tube drain hose and collection bottle.

(14) Bypass valve drain hose and collection bottle.

(15) Hydraulic pump drain hose and collection bottle.

C. Test Instrumentation And Test Cell Connections.
Install the special instrumentation and equipment that follows:

(1) PT2 and PS2 (8 locations) − (optional)

(2) PT2/TT2 Rosemount probe − (PWA 85523)

(3) TT2 − Compressor inlet total temperature (8 locations)

(4) Fuel flow (observed)

(5) T Fuel

(6) N1 RPM − (NL)

(7) N2 RPM − (NH)

(8) PT2.5*

(9) PS3

(10) PS4I (Optional)

(11) PT4.95

(12) Main Oil Pressure

(13) Main Oil Temperature

(14) Oil Filter Differential Pressure

(15) Fuel Pump Inlet Pressure

(16) Fuel Pump Pressure

(17) PAMB

(18) TT2.5*

(19) TT3*

(20) Vibration, fan case flange A (vertical)

(21) TT4.95 Harness Average (stand reading) If EEC T49 value is used, adjustment to T4.95 (real without shunt) must be made.

(22) Thrust - (observed)

(23) Thrust Lever and Fuel Select Switch

(24) Ignition Switch

(25) Test Cell Fuel Supply Pressure

(26) ARINC 429 transceiver.

(27) No. 3 Bearing Compartment Breather Pressure

* - A necessary parameter for the module analysis program MAPNET System. Optional unless a MAPNET System analysis is necessary.

D. Thrust Rating and Operation Limits

(1) Ratings at static sea level standard conditions are shown in Table 1302.

ENGINE MODEL	THRUST SETTING	JET THRUST LBS. (N)	TSFC *
PW4152 (-3A)	TAKEOFF	51110 (227348)	0.3353
PW4152 (-3A)	MAX CONTINUOUS	47160 (209778)	0.3284
PW4152 (-3A)	90% Max. Continuous	42450 (188827)	0.3219
PW4152 (-3A)	70% Max. Continuous	34200 (152129)	0.3154
PW4156A (-3A)	TAKEOFF	55950 (248878)	0.3457
PW4156A (-3A)	91% TAKEOFF	51000 (226859)	0.3351
PW4156A (-3A)	MAX CONTINUOUS	45730 (203417)	0.3262
PW4156A (-3A)	90% MAX CONTINUOUS	40940 (182110)	0.3202

THRUST AND TSFC RATINGS AT SEAL LEVEL STANDARD CONDITIONS
Table 1302

ENGINE MODEL	THRUST SETTING	JET THRUST LBS. (N)	TSFC *
PW4158 (-3A)	TAKEOFF	57610 (256262)	0.3498
PW4158 (-3A)	88% TAKEOFF	51000 (226859)	0.3351
PW4158 (-3A)	MAX CONTINUOUS	45490 (202349)	0.3259
PW4158 (-3A)	90% MAX CONTINUOUS	40770 (181354)	0.3201

*NOTE: TSFC (Thrust Specific Fuel Consumption) is for reference only for a new engine and is not necessary for the engine Acceptance Test.

THRUST AND TSFC RATINGS AT SEAL LEVEL STANDARD CONDITIONS
Table 1302 (Continued)

(2) The engine speed limits are shown in 71-00-00, Power Plant General - Testing-00, Engine Operation Limits, Task 71-00-00-990-007.

(3) The engine exhaust gas temperature (EGT) limits for Station 4.9 are shown in 71-00-00, Power Plant General - Testing-00, Engine Operation Limits, Task 71-00-00-990-007.

E. Seal Drain Leakage Limits

(1) During the Acceptance Test, the seal leakage must be measured. See 71-00-00, Power Plant General - Testing-00, Engine Operation Limits, Task 71-00-00-990-007.

(2) Attach a hose to each seal drain connection and put the other end of the hose in a collection bottle. Each bottle must be identified.

F. Multi-Point Instrumentation

(1) Multi-point instrumentation is necessary and is measured during the acceptance test for some parameters. To get satisfactory data, there is a limit for sampling points that do not operate. The necessary multi-point instrumentation and points that do not operate are listed as follows:

(a) TT2 - Eight sampling points are necessary with a maximum limit of two points that do not operate.

(b) Bellmouth pitot static probes (PT2 and PS2) − This parameter is optional. If it is used, eight sampling points are necessary with a maximum limit of two points that do not operate.

(c) Pitot static probes must be installed for test cell correlation testing. See the specifications shown in P&W publication Report No. 544.

(d) PT2 can be calculated for post test cell correlation testing without pitot static probes. Do a correlation of PT2 (pitot static) to: PT2 Rosemount probe, P cell or (PT2/Pamb vs N1 corrected).

G. Acceptance Test General Specifications

(1) Use the definitions that follow during the acceptance test.

(a) EPR−0 = Engine Pressure Ratio from the EEC (Electronic Engine Control) instrumentation system with a zero delta EPR modified (Class 09) Engine Program Plug (EPP) installed in the Electronic Engine Control (EEC).

OR

EPR−0 can be calculated by adding the necessary EPR Modification (delta EPR) used during the test run to the EPR output from the Engine Control (Engine Electronic Control EPR therefore EECEPR).

In the Airbus Engine Control logic EPR modification (delta EPR) is a function of TRA (throttle lever resolver angle). To correctly calculate EPR−0 from EECEPR, EPR class and TRA are necessary.

The Control logic removes the EPR modification (delta EPR) at low power to align the right and left wing engines. This logic is unique to Airbus installations and controls because it occurs in sea level test range, (below "C" band point when the TRA is less than 72 degrees).

Calculation of EPR-0. Because the recommended test configuration is with a class 16/ -0.028 delta EPR modifier, the calculation is shown as follows:

EECEPR = EPR-028

If TRA is equal or greater than 72 degrees,
EPR-0 = EPR-028 + .028

If TRA is between 40.5 and 72 degrees,
EPR-0 = EPR-028 + (1-(72-TRA)/31.5) x .028

If TRA is equal or less than 40.5 degrees,
EPR-0 = EPR-028

For other EPR class modifiers (other than class 16), see Table 1303 for values.

(b) EPR-028 = Engine Pressure Ratio form the EEC (Electronic Engine Control) instrumentation system with a class 16 (-0.028 delta) EPR modifier Engine Programming Plug (EPP) installed in the EEC.

(c) EPR = Engine Pressure Ratio From the EEC (Electronic Engine Control) instrumentation system with a class EEC programming plug to be calculated. To calculate EPR, (EPR-0 + delta EPR modifier). EPR is the value used in Paragraph Q. Check For Engine Acceptance to check for engine acceptance and to calculate engine margin to the limits.

(d) TRA = Throttle Resolver Angle, position of the EEC thrust control lever as specified by the electrical signal from the EEC.

EPR CLASS	EPR MODIFICATION (DELTA EPR)
01	+ .032
02	+ .028
03	+ .024

16	- .028

EEC PROGRAMMING PLUG (EPP) CLASSIFICATION
Table 1303 (Continued)

(2) All Acceptance Test specifications are from the test cell instrumentation except the EPR (Engine Pressure Ratio) which is the EPR value from the EEC. The EEC values for Tt2, N1, N2 can be used if it is shown they are consistent and equal to the stand readings. This must be done during the test cell correlation testing. The EEC values must be within the limits and tolerances of 71-00-00 Testing-00 Table 1305 of Test Instrumentation Calibration (Task 71-00-00-990-002). Any exceptions to this rule will be specified in the test procedure or correction to the observed section.

CAUTION: IF YOU USE AN INCORRECT EPP PLUG DURING ENGINE TEST, YOU WILL CAUSE ERRORS IN SETTING THE EPR RATING CLASSIFICATION AND IN DETERMINING ENGINE ACCEPTANCE TO LIMITS OF PARAGRAPHS Q. AND R. RESPECTIVELY.

(3) For standardization for all PW4000 engine models and to make sure that the engine will make Takeoff thrust, it is recommended that the Acceptance Testing be done with a class 16 EEC Programming Plug (EPP) installed in the EEC. Refer to SB PW4ENG 73-203 for EEC Programming Plug (EPP) part number for testing.

(4) After the Acceptance Test, the necessary class and part number of EEC programming plug must be selected. You must calculate the necessary class and get the part number from SB PW4ENG 73-203. After you select the necessary EEC programming plug, install it in the EEC. See the Component Maintenance Manual (CMM), - EEC Data Entry Plug, PN 50A450. This manual has the procedure for setting the plug classification.

(5) The EEC has logic for operation in two modes:

   (a) EPR = This is the primary mode.

   (b) N1 = This is the alternate mode which is the backup mode (default) for the EPR mode.

   (c) The Acceptance Test must be done in the EPR mode.

Table 1306B

H. Procedures To Prepare For Test

(1) Check that all the test instrumentation is calibrated and that there are no leaks.

(2) Service the engine oil system as shown in the procedures of 72-00-00 Servicing-02 (Task 72-00-00-610-002) or 72-00-00 Servicing-03 (Task 72-00-00-610-003).

(3) Prime the engine. See 71-00-00 Power Plant General-00, Oil and Fuel Systems Priming Procedure, (Task 71-00-00-760-003).

(4) Do the EEC static test. See 71-00-00 Test No. 7 - EEC Static Test, (Task 71-00-00-760-038).

I. Testing Prior to Acceptance Test

(1) Do the EEC idle test. See 71-00-00 Test No. 6 - EEC Idle Test, (Task 71-00-00-760-037).

NOTE: Start the engine with one Igniter A only.

(2) Do the idle leak test. See 71-00-00 Test No. 3 - Idle Power Test, (Task 71-00-00-760-030). Check for leaks, if necessary do an engine shutdown and repair any leaks.

NOTE: You can do Test No. 6 and 3 at the same time.

(3) Let the engine become stable for five minutes at MINIMUM IDLE.

(4) Make sure all the engine parameters are in the permitted limits. See Power Plant General - Testing-00, Engine Operation Limits, (Task 71-00-00-990-007).

(a) Make sure that the main oil pressure is in limits. The oil pressure must also be in the acceptance band shown in 71-00-00, Test No. 13, (Task 71-00-00-760-047).

(b) Make sure that the No. 1 - 2 bearing compartment breather pressure is in limits.

(c) Make sure that the No. 3 bearing compartment breather pressure is in limits.

(d) Make sure that the No. 3 bearing compartment scavenge temperature (T3 SCAV) is in limits.

(e) If the optional PS4I instrumentation is installed, make sure that the turbine cooling air pressure ratio (TCAR) is in the operator's historical range.

NOTE: The turbine cooling air ratio (TCAR) check is removed from all PW4000 engine manuals. Field experience shows that the assembly instructions and TOBI flow checks are sufficient to make sure that the engine will operate correctly. You must obey the assembly and check procedures specified in the engine manual and service bulletins.

(5) Make a record of N1 RPM, N2 RPM, T4.95 (EGT), oil pressure and temperature. Check the EEC for fault messages.

NOTE: It is recommended that a complete set of data be taken at this time to check the data system. The data system must be checked before the Engine Acceptance Test.

(6) Do an engine shutdown by the Normal Shutdown Procedure, (Task 71-00-00-760-005).

(7) Check the EEC status for fault messages. Do any maintenance that is necessary.

(8) Between 5 and 35 minutes after shutdown, fill the oil tank manually as shown in the procedures of 72-00-00 Servicing-02 (Task 72-00-00-610-002) or 72-00-00 Servicing-03 (Task 72-00-00-610-003). This oil fill step will be used to calculate the engine oil consumption. The oil consumption will be calculated in gallons per hour after the Acceptance Test.

NOTE: Do not use a remote engine oil fill system during the Acceptance Test. You must not add engine oil during the Acceptance Test.

J. Acceptance Test Data Records

(1) Make a record on the engine log sheet of the general information and data as follows:

(a) Date of the Acceptance Test.

(b) Engine serial number.

(c) Serial number of modules and major components.

(d) Fuel grade and specific gravity.

(e) Engine oil specification and brand.

(f) Ambient atmospheric conditions (true barometer, wet and dry bulb temperatures).

(g) Total time of the Acceptance Test.

(h) Reasons for any engine shutdowns that are not on the schedule.

(i) Any repairs that were necessary during the Acceptance Test.

(j) If it is applicable, the reason the engine was rejected after the Acceptance Test.

(k) The test operator must sign the engine log.

(l) The test inspector must sign the log.

(2) Make a record of the engine parameters shown in Paragraph C. "Test Instrumentation And Test Cell Connections", during the Acceptance Test. Make a record at each thrust lever position during the test, (except oil consumption).

K. Initial Running

NOTE: The INITIAL RUNNING is for the LPC/HPC break−in cycle and is only necessary if the LPC or HPC or both were replaced, repaired or are new. If the LPC/HPC break−in cycle is not necessary, go to the next testing step, Engine Acceptance Test.

(1) Use the run schedule specified in Figure 1301.

(2) Start the engine by the Engine Start Procedure (Normal), (Task 71−00−00−760−004). Start engine using Igniter B. Determine and record overall time from pressurization until MINIMUM IDLE speed is reached. Record data after five minutes at MINIMUM IDLE.

(a) Record data for all stabilized test points prior to moving thrust lever to the next requirement.

(b) Verify that the main oil pressure and the No. 3 bearing compartment breather pressure are within the limits shown under Testing-00, Operating Limits, (Task 71-00-00-990-007).

(c) If the optional PS4I instrumentation is installed, make sure that the turbine cooling air pressure ratio (TCAR) is in the operator's historical range.

(d) Check EEC status and maintenance words for faults. See 71-00-00, Fault Isolation-00 (Task 71-00-00-810-001).

(3) The acceleration in this section is to be done with reverse TRA. Verify in simulated deployed position that the 2.5 bleed is 100 percent open (88 percent of actuator stroke) throughout reverse operation.

CAUTION: IF AN ENGINE STALL OCCURS DURING THIS TEST, YOU MUST MOVE THE THRUST LEVER TO MINIMUM IDLE WITHIN ONE SECOND OF THE STALL. DO THE PROCEDURES SHOWN IN TESTING-00 "PROCEDURE AFTER ENGINE SURGE OR STALL" (TASK 71-00-00-760-009) AND DO THE "START PROCEDURE AFTER AN EMERGENCY SHUTDOWN" (TASK 71-00-00-760-006). IF YOU DO NOT DO THESE PROCEDURES, YOU CAN DAMAGE THE TURBINE TIP SEALS.

(a) Make a slow acceleration (30 - 60 seconds) to 8000 N2. Stabilize for two minutes at 8000 N2. Record data at the end of the stabilization period.

(b) Continue slow acceleration to 8500 N2. Stabilize for two minutes at 8500 N2. Record data at the end of the stabilization period.

(c) Continue slow acceleration to 8800 N2. Stabilize for two minutes at 8800 N2. Record data at the end of the stabilization period.

NOTE: At cold inlet temperature maximum reverse scheduling (fN1C), may restrict the engine from achieving 9000 rpm target.

(d) Continue slow acceleration to 9000 N2. Stabilize for two minutes at 9000 N2. Record data at the end of the stabilization period.

(e) Continue slow acceleration to max reverse TRA. Stabilize for five minutes at fixed TRA. Record data at the end of the stabilization period.

NOTE: At low inlet temperatures, high N2 speeds may result in high thrusts. DO NOT EXCEED 50000 LBS FN/ST2.

(f) Make a slow deceleration (30 - 60 seconds) to MINIMUM IDLE. Stabilize at MINIMUM IDLE for 0 - 30 seconds. Take the engine out of the simulated reverse position.

(g) Continue normal acceptance running.

L. Engine Acceptance Test (to be run following initial break in running for refurbished engines and all other engines).

(1) The Acceptance Testing-09 cycle is shown in the Engine Run Schedule, Figure 1301.

(2) Start the engine by the Engine Start Procedure (Normal), (Task 71-00-00-760-004).

NOTE: Start the engine with one Igniter B only.

NOTE: Monitor the main oil pressure, (MOP), during the start procedure. If you do not see any oil pressure, you must immediately and quickly stop the start procedure.

(3) Make a record of the time from fuel pressurization to MINIMUM IDLE speed.

(4) Let the engine become stable at MINIMUM IDLE.

(5) Make sure all the engine parameters are in the permitted limits. See Power Plant General - Testing-00, Engine Operation Limits, (Task 71-00-00-990-007).

(6) Operate the engine at MINIMUM IDLE for five minutes.

(7) If the optional PS4I instrumentation is installed, make sure that the turbine cooling air pressure ratio (TCAR) is in the operator's historical range.

(8) Check EEC status and maintenance words for faults. See 71-00-00, Fault Isolation-00 (Task 71-00-00-810-001).

(9) Continue slow acceleration (90 - 120 seconds) from MINIMUM IDLE to the thrust of Band A shown in Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3). Stabilize for three minutes. Record data and install TRA stop.

(10) Do the decel vibration survey as follows.

CAUTION: IF AN ENGINE STALL OCCURS DURING THIS TEST, YOU MUST MOVE THE THRUST LEVER TO MINIMUM IDLE WITHIN ONE SECOND OF THE STALL. DO THE PROCEDURES SHOWN IN TESTING-00 "PROCEDURE AFTER ENGINE SURGE OR STALL" (TASK 71-00-00-760-009) AND DO THE "START PROCEDURE AFTER AN EMERGENCY SHUTDOWN" (TASK 71-00-00-760-006). IF YOU DO NOT DO THESE PROCEDURES, YOU CAN DAMAGE THE TURBINE TIP SEALS.

(a) Make a slow deceleration (60 - 120 seconds) to MINIMUM IDLE, surveying engine vibration.

(b) At each speed where peaks have shown during the deceleration, record the mean vibration level of each pickup after 30 second stabilization.

(c) Check that the engine vibration values are in the permitted limits. See Testing-00, Engine Operation Limits, (Task 71-00-00-990-007).

(d) For engines that are more than the permitted vibration limits, do Testing-19, Trim Balance Procedure And Test, (Task 71-00-00-760-043), (Task 71-00-00-760-052) or (Task 71-00-00-760-057).

(11) Select APPROACH IDLE. Stabilize for 15 minutes. At the end of the stabilization period, record data.

(12) Do the snap acceleration/deceleration test cycle shown in 71-00-00, Testing-04 (Task 71-00-00-760-031) and perform step B.(9)(b) through B.(9)(i) for acceleration/deceleration test). Also see Engine Run Schedule shown in Figure 1301.

NOTE: The snap acceleration/deceleration must be done after the compressor break in cycle shown in above.

(13) Vibration Survey (Acceleration).

(a) An engine vibration survey shall be conducted on an engine that has been thermally stabilized. Completion of step L.(12) above without shutdown will result in a stabilized engine. If shutdown occurs, the engine must be run at thrust Band C, Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3) or higher for three minutes and then run for six minutes at MINIMUM IDLE prior to conducting the vibration survey.

(b) Make a slow acceleration (90 - 120 seconds) from MINIMUM IDLE to thrust Band A Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3).

(c) At each speed where peaks have shown during the acceleration, record the mean vibration level of each pickup after 30 second stabilization.

(d) Check the engine vibration levels during this test to make sure that the allowable limits are not exceeded. See 71-00-00, Testing-00, Vibration Limits, (Task 71-00-00-990-007).

(e) For engines that exceed the vibration limits, see 71-00-00, Testing-19 (Task 71-00-00-760-043), (Task 71-00-00-760-052) or (Task 71-00-00-760-057).

(14) Performance Calibration.

(a) Stabilize at thrust Band A Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3) for five minutes. At the end of the stabilization period, record data.

(b) Stabilize at thrust Band B Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3) for three minutes. At the end of the stabilization period, record data.

(c) Stabilize at thrust Band C Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3) for three minutes. At the end of the stabilization period, record data.

(d) Stabilize at thrust Band D Figure 1304 (Sheet 1), Figure 1304 (Sheet 2) or Figure 1304 (Sheet 3) for three minutes. At the end of the stabilization period, record data.

(e) Decelerate slowly (60 − 120 seconds) to APPROACH IDLE. Stabilize for 20 minutes.

(15) Engine shutdown procedure.

(a) Do an engine shutdown by the Normal Shutdown Procedure, (Task 71−00−00−760−005).

(b) Check the EEC status for fault messages. Do any maintenance that is necessary.

M. Procedures After Engine Shutdown − Corrections Of Observed Readings.

(1) Correct the observed data collected in thrust Bands A, B, C, and D of the performance calibration. Use the procedure defined in Figure 1302 (Sheet 1), Figure 1302 (Sheet 2), Figure 1302 (Sheet 3) and Figure 1302 (Sheet 4).

N. Engine Configuration Determination

(1) Based on the engine configuration identifier suffix in Table 1301, make sure that you are in the appropriate Testing−09 CONFIG section to use to class and check the engine for acceptance.

O. Check Corrected Data

(1) If the optional PS4I instrumentation is installed, make sure that the turbine cooling air pressure ratio (TCAR) is in the operator's historical range.

(2) Values of Corrected Net Thrust versus PT4.95/PT2 corrected N1, corrected N2, and corrected EGT, should fall within the requirements of Figure 1309 (Sheet 1), Figure 1309 (Sheet 2), Figure 1309 (Sheet 3), and Figure 1309 (Sheet 4). The lines on these figures are guidelines only and are not acceptance limits. Points outside these values can suggest that there is a instrumentation and/or other problem that must be identified.

(a) Definitions of terms used in Figure 1309 are as follows:

(b) Complete Refurbishment: Bands are for engines that had all modules repaired or replaced to new engine clearances and airfoil condition.

(c) Minor or No Refurbishment: Bands are for high time service engines that are fully deteriorated without any or only a small quantity of gaspath repair.

(3) Values of corrected PT2.5/PT2 and PS3/PT2.5 versus PT4.95/PT2 should fall within the guidelines of Figure 1309 (Sheet 5) and Figure 1309 (Sheet 6). The lines of these figures are guidelines only and not acceptance limits. Points outside these values can suggest that there is a instrumentation and/or other problem that must be identified.

(4) If a review of the test high power (points generally above 52000 lbf (231307.5 N) thrust, or 1.45 PT4.95/PT2) indicate a change in level relative to the check line shape as shown in Table 1307 below, this can be an indication of abnormal fan operation. This abnormal operation is also accompanied by a noticeable tone change in the engine. This change is triggered at high power by dirty and/or severely eroded fan blade leading edges. Corrective action must be taken. Refer to 72-00-31, Repair-01 (Task 72-00-31-300-001).

(5) Corrected Thrust Specific Fuel Consumption (TSFC) must be compared with the values listed in Table 1302. These values are included for reference to new engine levels only and are not intended as an acceptance requirement.

ABNORMAL FAN OPERATION

Delta P4.95/PT2	approximately +0.015 to 0.020	at Fn = K
Delta N1C	approximately +80 to +100 RPM	at Fn = K
Delta N2C	approximately −40 RPM	at Fn = K
Delta EGT	approximately −4°C	at Fn = K
Delta PT2.5/PT2	approximately +0.14 ratios	at P4.95/PT2 = K
Delta PS3/PT2.5	approximately −0.5 ratios	at P4.95/PT2 = K

PARAMETER SHIFT WITH ABNORMAL FAN OPERATION
Table 1307

P. Engine Pressure Ratio (EPR) Rating Classification

(1) The necessary EEC programming plug is specified by a part number and EPR class system. The programming plug part number is specified by the engine model and thrust rating. For the necessary EEC programming plug part number, see Table 1304, Table 1305, Table 1306. The necessary EPR Class must be selected by Engine Pressure Ratio (EPR), see SB PW4ENG 73-203.

(2) The plug part number and class is shown on the engine data plate. If a new part number or class plug is used, you must write (scribe) the new part number and class on the engine data plate.

(3) Make a EEC programming plug selection as follows:

(a) See SB PW4ENG 73-203 for the necessary Engine Programming Plug (EPP) for the engine model and hardware configuration that was tested. Confirm that the appropriate EPP part number was installed during acceptance testing.

NOTE: If the incorrect program plug (EPP) was installed during acceptance testing, contact Pratt & Whitney for assistance in correcting data/or rerun with the correct program plug.

(b) EPR class modifiers are used to make sure that the engine pressure ratio sent to the aircraft is less than the given limits. This will make sure that the engine will always give rated thrust at all possible take-off settings. The EPR limit is called "MAX EPR" and is shown in Table 1308 or Table 1309.

NOTE: A PW4152 (-3A) engine must only use the Bands A, B, and C points for the EPR Modifier classification. The PW4156A (-3A) and PW4158 (-3A) engines can use the Bands A, B, C and D points in the calculations.

(c) Use EPR-0 and Corrected Net Thrust from the four performance calibration points to find the EPR modifier class. Find the EPR modifier class which gives the highest EPR value and does not go more than the MAX EPR LIMIT specified by Table 1308 or Table 1309. Make a straight line curve to fit between the points shown on Table 1308 or Table 1309.

NOTE: To calculate EPR-0, go to Paragraph G.(1), Acceptance Test General Specifications.

NOTE: Make sure that the Stage 2.5 bleed valve is in the closed location. Do not use any data points (D band point) where the Stage 2.5 bleed valve starts to open to calculate the modifier class.

(d) To calculate EPR, use the EPR class defined above where EPR = EPR-0 + EPR Modifier. EPR is the value used in Paragraph Q. Check For Engine Acceptance, to check for engine acceptance and to calculate engine margin to the limits.

(e) If multiple ratings are desired, testing need only be performed to the highest rating desired and with a 3rd order curve fit of the four point acceptance data, other "A" band rating EPR-0 values can be found for EPR classification purposes as follows:

1 Use the four point acceptance data to find the 3rd order fit of thrust EPR-0.

2 Find the value of EPR-0 at the rating desired (use the minimum band thrust from Figure 1304).

3 Use the value of the EPR-0 and thrust value calculated in step 2 above as the "A band point. Find the EPR class requirement following the procedure outlined the above step (c). (Use the calculated A band point, with B, C, and D band from the data.)

(f) An example of the EPR class calculation (for a PW4158 (-3A) configuration) is shown in Table 1310.

FOR THESE CONFIGURATIONS: PW4152 (-3A), PW4156A (-3A), PW4158 (-3A) WITH SB PW4ENG 72-256 (AERO 2.5 LPT) AND SB PW4ENG 72-262 (RECAMBERED FEGV)

CORRECTED NET THRUST LBS (N)	MAXIMUM EPR
34000 lbf (151239.5 N)	1.2620

MAXIMUM EPR
Table 1309

EXAMPLE OF CALCULATING EPR MODIFIER CLASS FOR PW4158 (-3A) ENGINE CONFIGURATIONS

Step 1.
Start with the four performance calibration points from engine test.

CORRECTED NET THRUST

LBS (N)	(EEC EPR) EPR-028	TLRA	DELTA EPR MOD [SEE PARA. G. (1)]	= EPR-0
58125 lbf (258552.9 N)	1.555	79.8	.028	1.583
51500 lbf (229083.4 N)	1.444	74.2	.028	1.472
46209 lbf (205547.9 N)	1.376	70.1	.026	1.402
41066 lbf (182670.7 N)	1.317	65.7	.022	1.339

Step 2.
At the Corrected Net Thrust level of the four performance calibration points, find the Maximum EPR as shown in Table 1308 or Table 1309. Make a straight line curve to fit between the points shown on Table 1308 or Table 1309.

CORRECTED NET THRUST

LBS (N)	EPR-MAX
58125 lbf (258552.9 N)	1.5890
51500 lbf (229083.4 N)	1.4811
46209 lbf (205547.9 N)	1.4106
41066 lbf (182670.7 N)	1.3449

Step 3.
Find the delta EPR value for each point of Maximum EPR:

CORRECTED NET THRUST

LBS (N)	EPR-MAX	EPR-0	DELTA EPR

EXAMPLE OF CALCULATING EPR MODIFIER FOR PW4158 (-3A) ENGINES CONFIGURATION WHERE SERVICE BULLETINS SB PW4ENG 72-256 AND SB PW4ENG 72-262 ARE BOTH INCORPORATED
Table 1310

EXAMPLE OF CALCULATING EPR MODIFIER CLASS
FOR PW4158 (-3A) ENGINE CONFIGURATIONS

58125 lbf (258552.9 N)	1.5890	1.583	.0006
51500 lbf (229083.4 N)	1.4811	1.472	.0091
46209 lbf (205547.9 N)	1.4106	1.402	.0086
41066 lbf (182670.7 N)	1.3449	1.339	.0059

Step 4.
To find the EPR Class Number, use the delta EPR value from Step 3. above, and go to Table 1303.

DELTA EPR	CLASS NUMBER	EPR MODIFIER
0.006	8	+0.004
0.0091	7	+0.008
0.0086	7	+0.008
0.0059	8	+0.004

Step 5.
The EPR Modifier Class 9 will give the highest possible EPR and will not be more than the EPR-Max limit, (highest class number from above). Make a Class 9 modifier selection and then calculate EPR.

EPR-0	EPR MODIFIER	EPR
1.583	.004	1.587
1.472	.004	1.476
1.402	.004	1.406
1.339	.004	1.343

EXAMPLE OF CALCULATING EPR MODIFIER FOR PW4158 (-3A)
ENGINES CONFIGURATION WHERE SERVICE BULLETINS SB PW4ENG
72-256 AND SB PW4ENG 72-262 ARE BOTH INCORPORATED
Table 1310 (Continued)

Q. Check For Engine Acceptance

CAUTION: MAKE SURE THAT THE STAGE 2.5 BLEED VALVE IS IN THE CLOSED LOCATION. DO NOT USE ANY DATA POINTS TO CALCULATE ACCEPTANCE TO THE LIMITS WHERE THE STAGE 2.5 BLEED VALVE STARTS TO OPEN (D BAND POINT).

(1) The steady state values of corrected N2, N1 and TT4.95 (EGT) versus modified engine pressure ratio (EPR = EPR-0 + EPR Modifier) must be below the limits of Figure 1310 (Sheets 1 and 2), Figure 1311 (Sheets 1 and 2) and Figure 1312 (Sheets 1 and 2). All the calibration points (A Band through D Band) must be examined relative to the limit lines. A large difference between the calibration points and the limit line can indicate instrumentation or engine problems. Use A Band thrust levels for NH and NL acceptance. Use A Band and B Band thrust levels for EGT acceptance. Calculate the EGT margin to the limit line, the engine is acceptable if the average of the A Band and B Band margins is positive (greater than zero).

(a) Figure 1312 (Sheet 1) and Figure 1312 (Sheet 2) shows two maximum EGT limit curves. The upper EGT limit curve applies in all cases except when an engine is tested immediately following high turbine refurbishment. The lower EGT limit curve is to be used only after a high turbine refurbishment (turbine clearances restored) and before engine has flown with turbine cooling air system on.

(b) The N1 rotor speed limits are shown in Figure 1311 (Sheet 1), Figure 1311 (Sheet 2).

(c) Do an N2 Speed Limit Analysis. Figure 1310 (Sheet 1), Figure 1310 (Sheet 2) presents the corrected rotor speed limits for engines with SVS 29 N2 BIAS, SVS 29-3 N2 BIAS, SVS 29-5 N2 BIAS, or SVS 29-2 N2 BIAS. Refer to Table 1304 through Table 1306 to determine which SVS N2 limit line to use. Refer to the calculation procedures shown in Figure 1302 (Sheet 2), Item 5. Choose the correct calculation procedure based on the control version that is installed at the time of the test.

NOTE: The EEC incorporates for this engine configuration a fixed SVS 29-5 or a N2 biased stator vane schedules (SVS). For the N2 biased configurations, the schedule closes the HPC variable stator vanes 5 degrees for observed N2 rotor speeds less than 9550 N2 RPM and 9830 N2 RPM for RCC. The SVS transitions linearly to either the original OPEN schedule (SVS 29) or a closed (SVS 29-2) 2 degree schedule (HPC RCC Post SB 72-756 or 72-759) at N2 rpm's above 10250, the SVS 29-5 configuration engines, hold SVS schedule at SVS 29-5 for all N2's. Since the N2 Limit Curve Figure 1310 (Sheet 1), Figure 1310 (Sheet 2) and Figure 1310 (Sheet 3) is based on the original OPEN schedule, an adjustment must be made to the N2 data points before they are compared to this N2 Speed Limit Curve, Figure 1310 (Sheet 1), Figure 1310 (Sheet 2) and Figure 1310 (Sheet 3).

(d) Figure 1310 (Sheet 1) and Figure 1310 (Sheet 2) includes the more restrictive speed limits that are necessary for post SB PW4ENG 72-557 engines, (with redesigned 5th stage compressor blade). For simplicity, the more restrictive limits (if they are different) are to be used for both pre and post SB PW4ENG 72-557 engine configurations.

(e) For an example of a N2 Speed Limit Analysis, see Table 1311A for engines running SVS 29 N2 BIAS or see Table 1311B for engines running SVS 29-3 N2 BIAS. An example of a calculation for an engine running SVS 29 N2 BIAS is shown in Table 1312.

EXAMPLE - PROCEDURE TO DO AN N2 SPEED LIMIT ANALYSIS FOR ENGINES RUNNING WITH SVS 29 N2 BIAS

Step 1. Calculate the Corrected Observed N2:

Corrected Observed N2 = Observed N2/SQRT (THETA T2)

Step 2. Calculate FACTOR (Percent difference in N2, SVS 29-5 deg relative to SVS 29):

FACTOR = 1.11244 - 3.93387 x P4.95Q2 + 2.82184 x $P4.95Q2^2$

Where P4.95Q2 = PT4.95/PT2

Step 3. Calculate N2Rcl (Corrected N2 adjusted to SVS 29-5 deg):

If Observed N2 <= 9550 rpm, N2Rcl = Corrected Observed N2

If 9550 < Observed N2 < 10250

N2Rcl = Corrected Observed N2 x [1 + (FACTOR x [Observed N2-9550])/70000]

If Observed N2 >= 10250 rpm, go to step 4b

Step 4. Calculate N2Rop (Corrected N2 adjusted to SVS 29):

(a) If Observed N2 < 10250 rpm, N2Rop = N2Rcl/(1+ FACTOR/100)

(b) If Observed N2 >= 10250 rpm, N2Rop = Corrected Observed N2

Step 5. Calculate Corrected High Rotor Speed - RPM:

Corrected High Rotor Speed = N2Rop/KHN2 + delta N2 (See Figure 1302, (Sheet 4) NOTE 4.

Where KHN2 is found from Figure 1308.

PROCEDURE FOR CALCULATING CORRECTED HIGH ROTOR SPEED (N2) FOR LIMIT ANALYSIS FOR ENGINES RUNNING WITH SVS 29 N2 BIAS
Table 1311A

EXAMPLE - PROCEDURE TO DO AN N2 SPEED LIMIT ANALYSIS
FOR ENGINES RUNNING WITH SVS 29-3 N2 BIAS

Step 1. Calculate the Corrected Observed N2:

Corrected Observed N2 = Observed N2/SQRT (THETA T2)

Step 2. Calculate FACTOR (Percent difference in N2, SVS 29-5 deg relative to SVS 29):

FACTOR = 1.11244 - 3.93387 x P4.95Q2 + 2.82184 x P4.95Q2^2
Where P4.95Q2 = P4.95/P2

Step 3. Calculate N2Rcl (Corrected N2 adjusted to SVS 29-5 deg):

If Observed N2 <= 9550 rpm, N2Rcl = Corrected Observed N2

If 9550 < Observed N2 < 10250

N2Rcl = Corrected Observed N2 x [1 + (FACTOR x 0.4 x [Observed N2-9550])/70000]

If Observed N2 >= 10250 rpm, go to step 4(b)

Step 4. Calculate N2Rop (Corrected N2 adjusted to SVS 29):

(a) If Observed N2 < 10250 rpm, N2Rop = N2Rcl/(1+ FACTOR/100)

(b) If Observed N2 >= 10250 rpm, N2Rop = (Corrected Observed N2) / [1+0.6(Factor)/100]

Step 5. Calculate Corrected High Rotor Speed - RPM:

Corrected High Rotor Speed = N2Rop/KHN2 + delta N2
(See Figure 1302 (Sheet 4) NOTE 4)

Where KHN2 is found from Figure 1308.

PROCEDURE FOR CALCULATING CORRECTED HIGH ROTOR SPEED (N2) FOR LIMIT ANALYSIS FOR ENGINES RUNNING WITH SVS 29-3 N2 BIAS
Table 1311B

EXAMPLE − PROCEDURE TO DO AN N2 SPEED LIMIT ANALYSIS
FOR ENGINES RUNNING WITH SVS 29−5 N2 BIAS

Step 1. Calculate the Corrected Observed N2:

Corrected Observed N2 = Observed N2/SQRT (THETA T2)

Step 2. Calculate FACTOR (Percent difference in N2, SVS 29−5 deg relative to SVS 29):

FACTOR = 1.11244 − 3.93387 x P4.95Q2 + 2.82184 x P4.95Q2^2
Where P4.95Q2 = P4.95/P2

Step 3. Calculate N2Rop (Corrected N2 adjusted to SVS 29):

N2Rop = (Corrected Observed N2)/(1+ FACTOR/100)

Step 4. Calculate Corrected High Rotor Speed − RPM:

Corrected High Rotor Speed = N2Rop/KHN2 + delta N2 (See Figure 1302 (Sheet 4) NOTE 4)

Where KHN2 is found from Figure 1308.

PROCEDURE FOR CALCULATING CORRECTED HIGH ROTOR SPEED (N2) FOR
LIMIT ANALYSIS FOR ENGINES RUNNING WITH SVS 29−5 N2 BIAS
Table 1311C

EXAMPLE - PROCEDURE TO DO AN N2 SPEED LIMIT ANALYSIS
FOR ENGINES RUNNING WITH SVS 29-2 N2 BIAS

Step 1. Calculate the Corrected Observed N2:

Corrected Observed N2 = Observed N2/SQRT (THETA T2)

Step 2. Calculate FACTOR (Percent difference in N2, SVS 29-5 deg relative to SVS 29):

FACTOR = 1.11244 - 3.93387 x P4.95Q2 + 2.82184 x $P4.95Q2^2$
Where P4.95Q2 = P4.95/P2

Step 3. Calculate N2Rcl (Corrected N2 adjusted to SVS 29-5 deg):

If Observed N2 <= 9830 rpm, N2Rcl = Corrected Observed N2

If 9830 < Observed N2 < 10250

N2Rcl = Corrected Observed N2 x [1 + (FACTOR x 0.6 x [Observed N2-9830])/42000]

If Observed N2 >= 10250 rpm, go to step 4(b)

Step 4. Calculate N2Rop (Corrected N2 adjusted to SVS 29):

(a) If Observed N2 < 10250 rpm, N2Rop = N2Rcl/(1+ FACTOR/100)

(b) If Observed N2 >= 10250 rpm, N2Rop = (Corrected Observed N2) / [1+0.4 X (FACTOR)/100]

Step 5. Calculate Corrected High Rotor Speed - RPM:

Corrected High Rotor Speed = N2Rop/KHN2 + delta N2
(See Figure 1302 (Sheet 4) NOTE 4)

Where KHN2 is found from Figure 1308.

EXAMPLE - N2 SPEED LIMIT ANALYSIS - PW4158 (-3A) ENGINE
Table 1312

R. Procedures Necessary After Testing

(1) Oil consumption.

NOTE: When you do the visual inspection for leaks, it is possible to see a small quantity of remaining oil in the area of the spinner, at the bottom of the fan case, or at the HPC variable vane attach bolts at the bottom of the engine. The source of this oil is either the No. 1 bearing carbon seal assembly or the No. 2 bearing rear carbon seal assembly. After the engine windmills or after a long start procedure (conditions where carbon seal pressure differences are very low or negative), a small quantity of oil can get through the carbon seals and go to the external parts of the engine. This condition is satisfactory and is permitted. All other conditions of the inspection must be satisfactory. A limit for the quantity of oil that is permitted is not given. The limits that should be used when you make an estimate of the quantity of oil is oil consumption level.

(a) Between 10 and 15 minutes after engine shutdown, fill the oil tank manually as shown in the procedures of 72-00-00 Servicing-02 (Task 72-00-00-610-002) or 72-00-00 Servicing-03, (Task 72-00-00-610-003). Use a graduated measuring device and make a record of the quantity of engine oil that is added.

(b) Make a record of the engine oil consumption in gal/hr (l/hr) in the engine logs.

(c) If there is more oil in the oil tank after the Acceptance Test than before (such as oil that comes out the scupper drain), the oil must be checked for fuel by a laboratory.

(2) Seal Leakage Limits.

(a) Measure the quantity of leakage in each seal drain collection bottle. The leakage limits for each seal drain are shown in 71-00-00 Power Plant General - Testing-00, Engine Operation Limits, (Task 71-00-00-990-007).

(3) Check Filters.

(a) Remove the main oil filter and seals. Examine the filter for pieces of unwanted material (chips) and contamination. Record the results in the engine logs. Install a new main oil filter and seals.

(b) Remove the fuel filters and seals. Examine the filter for pieces of unwanted material (chips) and contamination. Record the results in the engine logs. Install new fuel filters and seals.

R 1 Look for bronze colored particles. If you find
R bronze contamination, you must replace the fuel
R metering unit and the fuel pump.

(4) Preservation.

(a) For engine preservation refer to 72-00-00, Storage/Transport-03, Accomplish Engine Preservation, (Task 72-00-00-620-001).

Engine Run Schedule
Figure 1301
(Task 71-00-00-760-063)

CORRECTION OF OBSERVED READINGS (SHEET 1 OF 4)

NOTE: For the Following Calculations:

- THETA T2 = $\theta T2 = \left(\frac{TT2\,^{\circ}C + 273.16}{288.16}\right)$
- DELTA T2 = $\delta T2 = \frac{PT2\ (IHGA)}{29.92}$
- Note 1 through Note 11 ..... See Sheet 4 Definitions

Item (1) Corrected Net Thrust - lbs

$$\frac{\text{Total (FN)}}{\delta T2} = \left(\frac{\text{Observed Thrust}}{\delta T2}\right) + \text{Delta FN}_{\text{Note 1}}$$

Item (2) Corrected Fuel Flow - lbs/hr

$$\frac{WF}{(\delta T2)\ (KC)\ (KHWF)} = \left(\frac{\text{Observed Fuel Flow}}{(\delta T2)\ (KC)\ (KHWF)}\right) \times \left(\frac{LHV}{18400}\right) + \text{Delta WF}_{\text{Note 2}}$$

KC is defined as $(\theta T2)^{0.59}$

KHWF is determined as follows:

(a) Obtain a value of KH' (min) which is a function of specific humidity (lbs moisture per lb of dry air) from Figure 1307. This value is a minimum correction and will be compared with that obtained in the following step.

(b) Using recorded ambient temperature and Corrected Net Thrust from Item (1) above, obtain values of C1 (Figure 1305), C2, and C3 (Figure 1306). Calculate KH' using the following equation:

$KH' = C1(SH + C2) + C3$, where SH = specific humidity (lbs moisture/lb dry air)

(c) Set KHWF equal to the greater of the values of KH' calculated above in Item (2) (a) and (b).

(d) LHV = Lower Heating Value of fuel in BTU/LBM.

PW V

Correction Of Observed Data
Figure 1302 (Sheet 1)
(Task 71-00-00-760-063)

CORRECTION OF OBSERVED READINGS (SHEET 2 OF 4)

Item (3) Corrected Thrust Specific Fuel Consumption (TSFC) – lbs/hr/lb

$$\left(\frac{\text{TSFC}}{(\text{KC})\ (\text{KHWF})}\right) = \left(\frac{\text{Corrected Fuel Flow}}{\text{Corrected Net Thrust}}\right) = \left\{\frac{\left[\frac{\text{WF}}{(\delta \text{T2})(\text{KC})(\text{KHWF})}\right]}{\left[\frac{\text{FN}}{\delta \text{T2}}\right]}\right\}$$

Item (4) Corrected Low Rotor Speed – RPM

$$\left[\frac{\text{N1}}{\sqrt{\theta \text{T2}}\ (\text{KHN1})}\right] = \left(\frac{\text{Observed N1}}{\sqrt{\theta \text{T2}}\ (\text{KHN1})}\right) + \text{Delta N1}_{\text{Note 3}}$$

where KHN1 is found from Figure 1308.

Item (5) Corrected High Rotor Speed – RPM
Engines running with SVS 29 N2 BIAS:
See calculation procedure outlined in Table 1311 A.
Engines running with SVS 29-3 N2 BIAS:
See calculation procedure outlined in Table 1311 B.
Engines running with SVS 29-5 N2 BIAS:
See calculation procedure outlined in Table 1311C.
Engines running with SVS 29-2 N2 BIAS:
See calculation procedure outlined in Table 1311 D.
Note 1: For an example calculation procedure for SVS 29 N2 BIAS configuration see Table 1312.
Note 2: Refer to Tables 1304 through 1306 to determine which SVS N2 BIAS is used.

Item (6) Corrected Exhaust Gas Temperature (EGT) – °C

$$\left[\frac{\text{TT4.95}^{o}\text{C}}{(\theta \text{T2})^{1.0}\quad (\text{KHT4.95})}\right] = \left[\frac{\text{Observed TT4.95}^{o}\text{C} + 273.16}{(\theta \text{T2})^{1.0}\quad (\text{KHT4.95})}\right] - (273.16) + \text{Delta TT4.95}_{\text{Note 5}}$$

where KHT4.95 is found from Figure 1308.

Item (7) Corrected Station 3 Temperature – °C

$$\left[\frac{\text{TT3}^{o}\text{C}}{(\theta \text{T2})^{0.932}}\right] = \left[\frac{\text{Observed TT3}^{o}\text{C} + 273.16}{(\theta \text{T2})^{0.932}}\right] - (273.16) + \text{Delta TT3}_{\text{Note 6}}$$

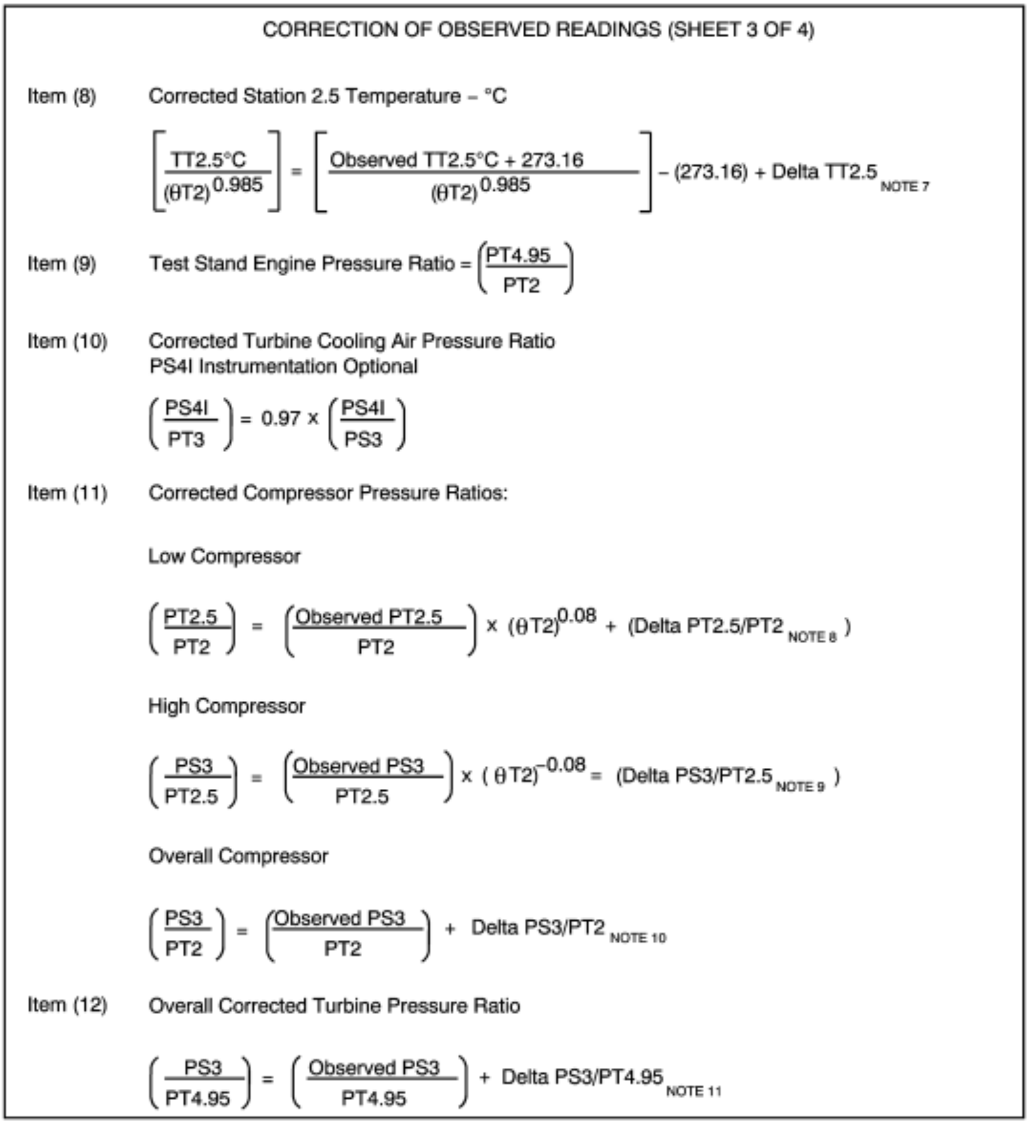
Correction Of Observed Data
Figure 1302 (Sheet 2)
(Task 71-00-00-760-063)



CORRECTION OF OBSERVED READINGS (SHEET 3 OF 4)

Item (8) Corrected Station 2.5 Temperature – °C

$$\left[\frac{TT2.5°C}{(\theta T2)^{0.985}}\right] = \left[\frac{\text{Observed } TT2.5°C + 273.16}{(\theta T2)^{0.985}}\right] - (273.16) + \text{Delta } TT2.5_{\text{NOTE 7}}$$

Item (9) Test Stand Engine Pressure Ratio $= \left(\frac{PT4.95}{PT2}\right)$

Item (10) Corrected Turbine Cooling Air Pressure Ratio
PS4I Instrumentation Optional

$$\left(\frac{PS4I}{PT3}\right) = 0.97 \times \left(\frac{PS4I}{PS3}\right)$$

Item (11) Corrected Compressor Pressure Ratios:

Low Compressor

$$\left(\frac{PT2.5}{PT2}\right) = \left(\frac{\text{Observed } PT2.5}{PT2}\right) \times (\theta T2)^{0.08} + (\text{Delta } PT2.5/PT2_{\text{NOTE 8}})$$

High Compressor

$$\left(\frac{PS3}{PT2.5}\right) = \left(\frac{\text{Observed } PS3}{PT2.5}\right) \times (\theta T2)^{-0.08} = (\text{Delta } PS3/PT2.5_{\text{NOTE 9}})$$

Overall Compressor

$$\left(\frac{PS3}{PT2}\right) = \left(\frac{\text{Observed } PS3}{PT2}\right) + \text{Delta } PS3/PT2_{\text{NOTE 10}}$$

Item (12) Overall Corrected Turbine Pressure Ratio

$$\left(\frac{PS3}{PT4.95}\right) = \left(\frac{\text{Observed } PS3}{PT4.95}\right) + \text{Delta } PS3/PT4.95_{\text{NOTE 11}}$$

Task 71-00-00-720-003:

1. Test No. 12 - Engine Oil System Vacuum Test

A. General

(1) Use this procedure to measure the airflow leakage into the bearing compartments.

B. Equipment And Materials Necessary
Standard Tools:

(1) Fluid drain collector/container capacity 5 US gal (18.93 liter)

(2) CTE 6075 Vacuum Cart

(3) Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

(4) Protection covers

Special Tools:
PWA 85498 Adapter
PWA 85843 Adapter
PWA 85845 Adapter
PWA 85978 Plug

Consumable Materials:

	Item No.	Designation
	P03-001	Engune Oil (PWA 521B)
	P05-289	Lockwire, (AS3214-02)
	P05-291	Cable, Safety (Optional)
	P05-292	Ferrule, Safety Cable (Optional)
R	P06-054	Paste, Antiseize (PWA 36246)

C. Procedure

(1) Find the airflow leakage limits into the bearing compartments. See Table 1301.

BEARING COMPARTMENT	MAXIMUM AIRFLOW PERMITTED
No. 1, 1.5, 2, 3 (Front And Rear) And Angle Gearbox	44 Lb/hour (19.96 kg/hour)
No. 4	10 Lb/hour (4.54 kg/hour)

Bearing Compartment Airflow Limits
Table 1301

CAUTION: INSTALL PROTECTION COVERS OVER ALL OPENINGS AS SOON AS POSSIBLE TO PREVENT ENGINE DAMAGE.

(2) Disconnect and loosen the No. 4 bearing oil scavenge tube assembly (LR06) as follows:

(a) Remove the bolt, nut and clamp which holds the spray shield to Flange M bracket at approximately the 7 o'clock position. Remove the hose clamp from the forward end of the spray shield and remove the shield from the engine. Remove the lockwire and disconnect the tube nut from the tube coupling. See Figure 1301 (Sheet 1), Figure 1301 (Sheet 2), Figure 1301 (Sheet 3) and Figure 1301 (Sheet 4).

(b) Remove the lockwire and disconnect the tube elbow from the exhaust case internal tube nut at approximately the 10 o'clock position.

(c) Remove the bolts, nuts and clamps which hold the tube to the Flange N and P brackets. Install tube protective covers.

(d) Remove the bolt, spacer, nut and clamp which holds the tube to the adjacent scavenge tube.

(3) Install the PWA 85843 Adapter into the tube coupling nut.

(4) Remove the No. 4 bearing strainer housing.

(a) Remove the hose clamp which holds the spray shield to the rear tube connection on the exhaust case at approximately the 10:30 o'clock position. Remove the shield from the engine. Remove the lockwire and disconnect the tube nut from the strainer housing.

(b) Remove the lockwire and disconnect the strainer housing from the exhaust case internal tube nut at approximately the 10:30 o'clock position.

(c) Close the tube openings for protection.

(5) Install PWA 85978 Plug into the tube coupling nut.

(6) Attach the vacuum hose and the pressure line to the CTE 6075 Vacuum Cart.

(7) For this test, set the vacuum cart pressure at Pamb minus 10 psi (−68.9 kPa) or Pamb minus 20 inches (−508 mm) Hg. At sea level this is 5.0 psia (34.5 kPa absolute). Make a record of the airflow leak rate into the No. 4 bearing compartment.

NOTE: For this vacuum test, (unless specified in this procedure) all the oil supply tubes, breather tubes, and scavenge tubes must be installed. Also, the gearbox pad covers for the integrated drive generator and hydraulic pumps must be installed.

(8) Remove PWA 85843 Adapter from the coupling nut. Close the tube openings with standard shop fittings.

(9) Remove the cover installed on the gearbox port. Install PWA 85498 Adapter on the boss using the detail bolts. Install the adapter so that the larger threaded opening is pointed away from the engine. If the deoiler outlet tube is still attached, use PWA 85845 Adapter. Attach CTE 6075 Vacuum Cart.

(10) For this test set the vacuum cart pressure at PAMB minus 10 psi (69 kPa), or PAMB minus 20 inches (508 mm) HG. At sea level this is 5.0 psia (34.5 kPa absolute). Find the airflow leak rate into the 1, 1.5, 2 and 3 bearing compartment and the angle gearbox.

(11) Disconnect vacuum cart hoses and remove PWA 85845 Adapter or PWA 85498 Adapter and remove vacuum check PWA 85978 Plug.

(12) Install the No. 4 bearing strainer housing.

(a) Install the strainer housing, threads lubricated with Engine Oil P03−001, to the exhaust case internal tube nut at approximately the 10:30 o'clock position, tighten by hand

(b) Install the (LP16) No. 4 bearing oil pressure tube assembly to the strainer housing. Install the tube, threads lubricated with Engine Oil P03−001, to the strainer housing on the exhaust case, tighten by hand.

(13) Connect and clamp the (LR06) No. 4 bearing oil scavenge tube assembly as follows:

(a) Remove protection and install tube elbow with
R nut threads lubricated with Antiseize Paste
R P06−054, to the exhaust case internal tube nut at
approximately the 10 o'clock position, and to the
tube coupling forward of Flange M at approximately
R the 7 o'clock position, tighten by hand. Remove
R unwanted paste.

(b) Install the clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts securing the tube to Flanges N and P brackets. Torque the clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Install the clamp, bolt, threads lubricated with Engine Oil P03−001, spacer, and nuts to hold the (LR06) tube to the adjacent (LP16) No. 4 bearing oil pressure tube assembly.

(d) Torque the tube nut at the exhaust case connection to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(e) Torque the tube nut at Flange N connection to 475 − 525 lb−in. (53.668 − 59.317 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(f) (Reference 2151) Install the spray shield to the inboard side of Flange N connection and attach the forward end of the shield with a hose clamp. Torque the hose clamp to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(g) Install the clamp to the rear end of the shield and Flange M bracket with bolt, threads lubricated with Engine Oil P03−001, and nut. Torque bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(14) Torque the (LP16)(LP16) No. 4 bearing oil pressure tube nut to the strainer housing. Torque the tube nut to 450 − 500 lb−in. (50.843 − 56.492 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(15) Torque the exhaust case internal tube nut to the last chance strainer housing to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(16) (Reference 2151) Install the spray shields to the inboard side of the front and rear connections and attach with hose clamps. Torque the hose clamps to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(17) Refer to the Test Reference Table, Testing−00, Task 71−00−00−990−003.

Task 71-00-00-760-047:

1. Test No. 13 - Main Oil Pressure Test And Adjustment

A. General

(1) Use this procedure to check the engine main oil pressure and if necessary, to adjust the oil pressure to the necessary limits.

(2) Acceptable main oil pressure readings at high rotor speeds (N2) are provided in this procedure. Main oil pressure is oil supply pressure (LP-1) minus No. 1 and 2 breather pressure (LB-6).

(3) Main oil pressure readings not within specified limits must be adjusted by replacing the external oil tube metering nipple with one of a different class.

B. Equipment And Tools Necessary

Standard Tools:

Bergen Mechanical Crimper (Optional)Model M303, M305 or M307

Consumable Materials

Item No.	Designation
P05-289	Lockwire, (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P06-021	Compound, Antigalling (PWA 550)
P06-036	Compound, Antigalling (PWA 36065)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Nipple, Metering Tube - See Note 1	1	79-21-00/8/230

Note 1: Specific class must be calculateded by the Testing-13 procedure.

C. Test Procedure

POWER PLANT GENERAL − TESTING−13

CAUTION: IF YOU SEE UNUSUALLY HIGH MAIN OIL PRESSURE OVER THE TRIM BAND, DO AN ENGINE SHUTDOWN. UNUSUALLY HIGH OIL PRESSURE CAN BE CAUSED BY PARTIAL BLOCKAGE OF THE OIL PASSAGEWAYS. EXAMINE THE OIL SYSTEM FOR BLOCKAGE. IF YOU DO NOT SHUTDOWN QUICKLY, DAMAGE TO THE ENGINE WILL OCCUR.

NOTE: Unusually high main oil pressure can be caused by partial blockage of the oil system passageways. Several instances have occurred where a bolt was dropped in the fuel/oil cooler and traveled into the oil pressure manifold. The bolt blocked the oil flow to the Number 3 bearing compartment. This will cause oil starvation to the Number 3 bearing and much engine damage.

(1) Make sure there are no leaks per Testing−03 Task 71−00−00−760−030 prior to testing for main oil pressure.

(2) Start the engine by the Engine Start Procedure (Normal) Task 71−00−00−760−004.

(3) Let the engine become stable for five minutes at MINIMUM Idle.

(4) Make sure all the engine parameters are in the permitted limits. Make a record of the N2 speed, oil pressure and breather pressure readings.

(5) Slowly move the thrust lever forward to 1.3 EPR. Let the engine become stable. Make a record of the N2 speed, oil pressure and breather pressure readings.

(6) Slowly move the thrust lever forward to 1.4 EPR. Let the engine become stable. Make a record of the N2 speed, oil pressure and breather pressure readings.

(7) Slowly move the thrust lever to MINIMUM IDLE and operate the engine for five minutes.

(8) Do an engine shutdown by the Normal Shutdown Procedure, Task 71−00−00−760−005.

(9) Examine the record of the oil pressure and N2 speed data. The limits are shown in Figure 1301 (Sheet 1) and Figure 1301 (Sheet 2). If the oil pressure data for the engine is in the permitted limits, this test is complete.

NOTE: Subtract No. 1 and 2 breather pressure (LB−6) reading from oil supply pressure (LP−1) reading.

D. Adjustment Procedure

(1) If the oil pressure data is not in the permitted limits, the the oil pressure must be adjusted as follows:

(a) For engines prior to SB PW4ENG 72−114 select new class oil tube metering nipple. See Figure 1302 and Table 1301.

(b) For engines incorporating SB PW4ENG 72−114 select new class oil tube metering nipple. See Figure 1303 and Table 1301.

WARNING: TAKE NECESSARY PRECAUTIONS TO AVOID POSSIBLE BURNS DUE TO CONTACT WITH HOT OIL.

(2) Replace the tube metering nipple as follows:

CAUTION: YOU MUST USE THE WRENCHING FLATS ON THE TUBE METERING NIPPLE WHEN YOU LOOSEN OR TIGHTEN THE TUBE NUTS. THIS WILL PREVENT ANY TWIST DAMAGE TO THE TUBES.

(a) Remove the lockwire from the tube nuts. While you hold the tube metering nipple with a wrench, loosen and disconnect the tube nuts from the nipple. Remove the nipple. See Figure 1304.

(b) Lubricate the back of the ferrules of the two tube nuts that attach to the nipple with Antigallant Compound P06−036. See Figure 1305. Install the new class nipple, threads lubricated with Antigalling Compound P06−021, to the tube nuts and tighten by hand.

CAUTION: YOU MUST USE THE WRENCHING FLATS ON THE TUBE METERING NIPPLE WHEN YOU LOOSEN OR TIGHTEN THE TUBE NUTS. THIS WILL PREVENT ANY TWIST DAMAGE TO THE TUBES.

(c) While you hold the nipple with a wrench, torque the tube nuts to 675 − 750 lb−in. (76.265 − 84.739 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(3) If the tube metering nipple was replaced, it will be necessary to do the engine test procedure again to make sure the oil pressure is in the specified limits. Also check that the new metering nipple does not have an oil leak.

NOTE: Variation in main oil pressure readings from engine to engine is acceptable provided readings are within specified limits.

(Task 71−00−00−760−047)

CHANGE IN MAIN OIL PRESSURE RESULTING FROM TRIM CHANGE
ENGINES PRIOR TO SERVICE BULLETIN PW4ENG-72-114

- INCREASE IN OIL PRESSURE REQUIRES DECREASE IN TRIM ORIFICE DIAMETER.
- DECREASE IN OIL PRESSURE REQUIRES INCREASE IN TRIM ORIFICE DIAMETER.
- APPLIES FOR ENGINE OIL-OUT TEMPERATURE (MOT) ABOVE 200°F(93.3°C).

Task 71-00-00-760-050:

1. Test No. 14 - P2/T2 Probe And P2 Supply Tube Leak Check

A. General

(1) Use this procedure to check the engine P2/T2 probe and P2 supply tubes for leaks. The PT2 system is pressurized from the EEC PT2/TT2 probe, located in the inlet cowl or bellmouth, to (and including) the EEC.

(2) No leaks in the system are acceptable. Any leaks found must be corrected.

(3) This PT2 system leak check must be performed following inlet cowl installation. See Testing-00, Test Reference Table, Task 71-00-00-990-003, for additional information.

B. Equipment And Tools Necessary

Standard Tools:

(1) A regulated air supply source that can supply air pressure between atmospheric and 10 psig (68.9 kPa). The gage must be accurate to ± 10 percent. The system must have an isolation shutoff valve. The air must be clean and dry.

(2) Tygon flexible tubing, 0.250 inch (6.350 mm) inside diameter.

Consumable Materials:

Item No.	Designation
P05-007	Leak Check Fluid (PMC 9569 or PMC 2277)

C. Procedure

(1) Find the P2/T2 probe and the EEC. The P2/T2 probe is found in the engine intake. The EEC is found on the outside of the fan case at approximately the 7 o'clock position. Figure 1301 (Sheet 1).

NOTE: This procedure supplies low pressure air to the P2 system to test for leaks. Leaks are not permitted for the P2 system. If the P2 system has leaks, they must be repaired.

(2) Get the regulated air pressure supply.

  (a) The air pressure must be accurately set between atmospheric and 10 psig (68.9 kPa) maximum.

  (b) The pressure must be checked with a gage with an accuracy of ± 10 percent.

  (c) The air must be clean and dry.

  (d) The supply system must have an isolation shutoff valve.

CAUTION: DO NOT LET THE AIR PRESSURE SUPPLY GO MORE THAN 15 PSIG (103.4 kPa) TO THE P2 SYSTEM. HIGHER PRESSURE CAN CAUSE DAMAGE TO THE EEC.

(3) Pressurize the PT2 system to 10 psig (68.9 kPa) maximum, holding flexible tubing (Tygon tubing 0.250 inch (6.350 mm) ID or equivalent) to PT2 inlet port of probe. Figure 1301 (Sheet 2).

(4) Turn the shutoff valve to the off position to isolate the P2 system. If the pressure decreases there is a leak in the P2 system.

(5) Use Leak Check Fluid P05−007 to find the leak.

(6) Repair the leaks as necessary.

(7) After the leaks are repaired, do the P2 pressure check again to make sure all the leaks are repaired.

(8) Remove the air supply from the engine.

Task 71-00-00-790-001:

1. Test No. 18 - Oil System Leak Test (Dye Method)

A. General

(1) Use the Oil System Leak Test to find the leaks in the oil system with a blue dye that is applied to the engine oil before the test. Use of blue dye is optional for detection of leaks. After this test, the oil with the dye must be drained from the engine. This will permit a distinction between a nuisance leak (from engine assembly oil weeping from seams) and a true leak from the engine lube system.

B. Equipment And Materials Necessary

Consumable Materials:

Item No.	Designation
P03-001	Lubricant, Engine Oil (PWA 521)
P05-459	Dye, Blue (PMC 4513)

C. Prepare The Oil System For The Leak Test

WARNING: BEFORE YOU REMOVE THE OIL TANK CAP, YOU MUST WAIT A MINIMUM OF FIVE MINUTES AFTER SHUTDOWN TO LET THE OIL PRESSURE BLEED OFF. THE HOT OIL CAN BURN YOUR EYES AND SKIN.

(1) Drain the oil system fully with the existing procedures.

(2) Mix the Blue Dye P05-459 with the Engine Oil Lubricant P03-001 by Solutions-01 (Task 70-22-00-980-001-197). Refer to Section 70-22-00 in the Standard Practices Manual, PN 585005.

(3) Add the SP 197 Blue dye solution in the oil system at the engine oil tank to refill the system by the applicable procedures. Refer to Section 72-61-00, Disassembly-01 and Assembly-05 for the removal and installation of the oil tank cap.

(4) Clean all the remaining oil from the engine external surfaces, tubes, components and accessories by SPOP 1 (Task 70-21-00-110-047) or SPOP 208 (Task 70-21-00-110-040). Refer to Section 70-21-00 in the Standard Practices Manual, PN 585005.

D. Test Procedure (Idle Only)

(1) Start the engine by the Normal Engine Start Procedure (Task 71−00−00−760−004).

(2) Let the engine become stable for five minutes at minimum idle.

(3) Make sure all the engine parameters are in the permitted limits. The oil temperature must be at the operating limits. See Engine Operation Limits (Task 71−00−00−990−007).

(4) Do an engine shutdown by the Normal Shutdown Procedure (Task 71−00−00−760−005).

E. Procedure After Idle Testing

(1) Do a visual inspection of the engine for oil leaks. The leak location will be identified by the blue fluid at the tube joints or component.

NOTE: Amber color leaks are the result of assembly fluids. Blue leaks are the result of engine oil.

(2) Check the seal drains for signs of the blue fluid.

(3) If necessary, repair the joints or components with leaks. After all the leaks are repaired, clean the dye by SPOP 1 (Task 70−21−00−110−047) or SPOP 208 (Task 70−21−00−110−040) and then check the oil system again for leaks. Refer to Section 70−21−00 in the Standard Practices Manual, PN 585005.

NOTE: It is possible that more running time is necessary at high power to get wetting of the leak area. Running time should be kept to a minimum to prevent too much leakage.

NOTE: If a satisfactory leak check is done, go to Step H (1) after all the leaks are repaired.

F. Optional Test Procedure (TAKE−OFF power)

NOTE: This testing is not necessary if you find all the leaks by the first testing (idle only) procedure.

(1) Start the engine by the Normal Engine Start Procedure (Task 71−00−00−760−004).

(2) Let the engine become stable for five minutes at minimum idle.

(3) Make sure all the engine parameters are in the permitted limits. The oil temperature must be at the operating limits. See Engine Operation Limits (Task 71−00−00−990−007).

(4) Operate the engine at TAKE−OFF Power for one minute.

(5) Reduce the engine power to 1.3 EPR. Stay at this power for two to three minutes.

(6) Do an engine shutdown by the Normal Shutdown Procedure (Task 71−00−00−760−005).

G. Procedure After Optional Testing

R NOTE: For engines in test cell, Item (3) thru Item (6) are
R not applicable.

(1) Do a visual inspection of the engine for oil leaks. The leak location will be identified by the blue fluid at the tube joints or component.

NOTE: Amber color leaks are the result of assembly fluids. Blue leaks are the result of engine oil.

(2) Check the seal drains for signs of the blue fluid.

(3) If necessary repair the joints or components with leaks. After all the leaks are repaired, clean the dye by SPOP 1 (Task 70−21−00−110−047) or SPOP 208 (Task 70−21−00−110−040) and then check the oil system again for leaks. Refer to Section 70−21−00 in the Standard Practices Manual, PN 585005.

H. Procedure After All Leaks Are Repaired

(1) After all the leaks are repaired, drain the dyed oil from the oil system. Drain the oil from the oil tank, main gearbox, angle gearbox, magnetic chip detectors and remove the main oil filter element. Refer to Section 72−00−00, Servicing−03 (Task 72−00−00−610−003).

(2) Remove the main oil filter element and replace with a new one.

NOTE: Make sure you service the oil system before you return the engine to service.

(3) Fill the oil system with new oil and install a new main oil filter element. Refer to Section 72-00-00, Servicing-03 (Task 72-00-00-610-003).

(4) Start the engine by the Normal Engine Start Procedure (Task 71-00-00-760-004).

(5) Operate the engine for three minutes minimum time at minimum idle.

(6) Do an engine shutdown by the Normal Shutdown Procedure (Task 71-00-00-760-005).

(7) Drain the oil from the oil system. Drain the oil from the oil tank, main gearbox, angle gearbox, magnetic chip detectors and remove the main oil filter element. Refer to Section 72-00-00, Servicing-03 (Task 72-00-00-610-003).

(8) Fill the oil system with new oil and install a new main oil filter element. Refer to Section 72-00-00, Servicing-03 (Task 72-00-00-610-003).

Previous Pageblock Return to Previous Menu Next Pageblock

Task 71−00−00−760−043:

1. Test No. 19 − Trim Balance Procedure and Test

A. General

(1) See Test No. 19 − Sommervaille Three Weight Method Task 71−00−00−760−052 for optional procedure.

(2) See Test No. 19 − Optional "P" Flange Location For Low Rotor (N1) Trim Balance Procedure, Task 71−00−00−760−057 for optional procedure.

(3) If the N1 rotor vibration amplitude and/or phase angle values are not stable from one test run to the next test run, lubrication of the Stage 1 LPC (fan) blades can be necessary. The fan blade root lubrication procedure, (Task 71−00−00−380−002), follows this trim balance task.

B. Equipment And Materials

Standard Tools:

Vibro Tool Marker	Used for marking counterweights
Analyzer, Vibration	Spectral Dynamics Model SD119 or Endevco 68101A or Mechanical Technology Inc. Model 4000, PBS 4100 or equivalent.
Generator, Optical	Endevco 35389 or equivalent phase reference tachometer.
Amplifier, Isolation	100K ohms − Endevco or equivalent (may not be required − dependent on analyzer model/type used)
Amplifier, Charge	Endevco or Mechanical

Standard Tools:

(CONTINUED)

Technology Inc., or
equivalent

Counterweight, LPC Fan Hub	As Necessary	72-31-00/4/40
Counterweight, LPC Fan Hub	As Necessary	72-31-00/4/50
Rivet, Fan Counterweight	As Necessary	72-31-00/4/60
Counterweight, LPT Clip-On	0 - 10	72-53-00/6/100
Packing	1	72-32-00/2/30

C. General Trim Balance Specifications

NOTE: If vibration occurred after fan blade replacement, the replaced blades should be inspected to verify that the moment weight pairs do not exceed 1.0 oz-in. (720. g.mm) difference. The moment weight is marked on the concave airfoil surface inboard of the mid-span shroud. If necessary, replace with a different set of moment weight fan blade pair.

CAUTION: TRIM BALANCE SHOULD NOT BE USED TO CORRECT VIBRATION CAUSED BY MECHANICAL PROBLEMS. EXAMPLES OF THIS TYPE OF PROBLEM ARE:

CAUTION: INCORRECT ASSEMBLY - INCORRECT ASSEMBLY DURING ENGINE OVERHAUL OR REPAIR CAN BE SHOWN BY VIBRATION LEVELS LARGER THAN TWICE THE VIBRATION LIMIT. SEE 71-00-00, TESTING-00, Task 71-00-00-990-007.

CAUTION: DAMAGE TO ROTOR PARTS - PART DAMAGE MUST BE REPAIRED BEFORE ENGINE TRIM BALANCE.

(1) Trim balance can decrease engine vibration. The trim balance procedure adds a small amount of weight to correct unbalance. The weight(s) are installed on the compressor front balance plane and the turbine rear balance plane. The trim balance procedure is done on the engine while it is in the test stand.

(2) Trim balance is only used to correct stable low rotor related (1EL) vibration.

(3) It is recommended that you do a fan plane balance first for two reasons:

  (a) Because a fan plane balance will cause the vibration values to decrease at both the "A" and "P" flange (LPT) pickups.

  (b) Because it is easier to install fan plane trim balance counterweights than the LPT counterweights.

(4) The total vector sum of the trim balance weights and the weights installed for component (LPC) balance must not be more than the limits that follow:

  (a) Fan plane: 50 oz−in. (36,000 g.mm)

  (b) LPT: 48 oz−in. (34,560 g.mm)

  (c) Engines that require more correction weight than allowed should be inspected for incorrect assembly and/or part damage.

(5) Identify all the trim balance weights permanently with the letters "TB".

  NOTE: The balance weights installed on the fan hub during LPC balance are not identified with the letters "TB".

(6) If the sum of the low rotor and the high rotor vibration does not equal the total vibration, then some N1 or N2 related vibration harmonics can be present. The total vibration limit applies to the square root of the sum of the N1 vibration squared plus the N2 vibration squared.

(7) Trial balance weights are identified as CW1, CW2, CW3, etc.

(8) Definitions:

  (a) 1EL: The low rotor related vibration.

(b) Vibration Units: Measure vibration displacement in mils (mm) or vibration velocity in inches per second (mm per second).

1 mil = 0.001 inch (0.025 mm)

(c) Phase Angle Lag: The angle the low rotor turns during the time the "heavy point" goes by the vibration transducer and the effect of this is shown.

NOTE: This procedure uses phase measurement equipment that measures from the N1 speed pulse to the vibration pulse (maximum). Measure positive angles, in this coordinate system, in the opposite direction from the direction in which the engine turns. Some phase measurement equipment, such as MTI equipment, measure positive angles in the direction in which the engine turns (lead angle).

(d) Phase Angle: The angle between the signal from the vibration transducer and the signal from the once per revolution N1 speed reference.

(e) Sensitivity: The moment weight that causes 1.0 mil (0.025 mm) of vibration.

(f) Once Per Revolution N1 Speed Reference: The short tooth of the tachometer gear on the turbine shaft coupling makes a signal to the N1 speed transducer once each revolution. As an alternative method, use an optical tachometer for the once per revolution N1 speed reference.

(g) N1 Reference Blade: Fan blade ink marked for reference to short tooth location.

(h) Stable Vibration: Stable vibration is a vibration of which the maximum does not change by more than one quarter of the average (vibration) during 30 seconds of engine operation.

(i) Vibration Survey: The process of acquiring and recording engine vibration data versus rotational speed during an engine acceleration/deceleration. This is used to document that an engine is within vibration limits or to identify peak vibration levels at certain engine speeds which are not within vibration limits.

(j) Trim Balance Survey: The process of acquiring and recording at each peak vibration level the steady state (1EL) low rotor engine vibration amplitude and phase angle data used to make the correction weight calculations.

D. Procedure

(1) Install the accelerometers (vibration transducers). See Figure 1301 (Sheet 1) and (Sheet 2).

NOTE: Install accelerometer leads along tubes and harnesses, and attach every 12 − 16 inches (305. − 406. mm). Do not install on tubes which contain hot bleed air. Install accelerometer leads so that they will not touch the closed nacelle doors.

(a) Install a PWA 86137 Bracket and a PWA 85703 Accelerometer And Lead Assembly to the bracket on Flange A, in bolt hole No. 3 location from 12:00 o'clock position. See Figure 1301 (Sheet 1).

(b) Install a PWA 85774 Bracket and a PWA 85703 Accelerometer And Lead Assembly on Flange P in bolt holes No. 18 and 19 locations from 12:00 o'clock position. See Figure 1301 (Sheet 2).

(2) Find the mark (recess) that refers to the once per revolution N1 speed signal.

(a) Remove the compressor inlet cone. See 72−00−31, Removal−02 Task 72−00−31−020−001.

(b) Remove the key washer retaining ring and the retaining nut key washer which holds the turbine shaft plug, at the front of the coupling. Use a PWA 85306 Puller to remove the plug. Discard the packing. See Figure 1302.

(c) Find the small recess on the end of the turbine shaft coupling assembly. This recess shows the location of the short tooth which makes the signal for the N1 speed transducer. Mark the fan blade which is aligned with this recess, using Ink P05−026, in an easily seen location. If an optical tachometer is used, install a 4 inch (101.600 mm) by 5 inch (127.000 mm) piece of Tape P05−135 on a fan blade.

NOTE: When the optical method is used the ink marked fan blade and rub strip must still be aligned before you install any trim balance weights.

(d) Install a new packing lubricated with Petrolatum White P06−002, to the turbine shaft plug. Install the plug to the coupling ID and install the key washer and the retaining ring.

NOTE: Make sure retaining ring is fully inserted in the retaining nut groove, all around, and ring end gap is 0.010 inch (0.254 mm).

(e) Examine the hub flange for installed counterweights. Check each counterweight for the letters "TB" marked on the inner diameter face. Remove all the counterweights marked "TB"

NOTE: Remove only those counterweights marked "TB".

(f) Install the compressor inlet cone. See 72−00−31, Install−02 Task 72−00−31−420−001.

(g) Make a mark on the fan blade rubstrip, with Silver Pencil P05−018, at the N1 transducer location which is at the seven o'clock position (when seen from the front).

(3) Install the trim balance equipment. See Figure 1303 or Figure 1304.

NOTE: If the N1 speed transducer is used: N1 signal comes from the N1 speed transducer on either the Channel A connector J19 pins "1" and "2" or the Channel B connector J19 pins "4" and "5".

(a) Install a PWA 86140 Harness Assembly to the N1 probe connector and plug it into the isolation amplifier/vibration analyzer equipment.

NOTE: An isolation amplifier may not be required dependent upon the model/type of the vibration analyzer used.

(b) Attach Flanges A and P vibration PWA 85703 Accelerometer Wire Leads, at two places, into the charge amplifier/vibration analyzer equipment

NOTE: The N1 signal characteristics are: The minimum, no load, equals one volt. The maximum, no load, equals 30 volts. The frequency (Hz) equals N1 rpm (from the short tooth signal).

(4) Operate the engine in it's "as is" (before trim balance) condition. See 71-00-00 Testing-08, Task 71-00-00-760-032.

(a) Make sure the trim balance equipment operates correctly during engine operation. Make sure that the N1 speed shown on the trim balance analyzer and test stand agree. Make sure that the phase angle becomes stable as the engine becomes stable.

(b) Make a graph of the vibration and the N1 speed. Find the N1 speed that causes the maximum 1EL. Return the engine to idle.

(c) Wait five minutes at idle and find four to six steady state speeds; above, below and at the problem N1 speed, 100 rpm apart, and at the maximum allowable operating speed. See Power Plant General - Testing-00, Engine Operation Limits Task 71-00-00-990-007.

(d) Start of the lowest N1 speed found in the step above. Accelerate to each steady state speed, and record Flanges A and P 1EL and phase angle.

(e) Shut down engine as described for normal engine shutdown.

(5) Find which low rotor plane (the fan or the LPT) will be trim balanced. A vibration maximum at an approximate N1 speed of 2000 rpm for Flange A and 2800 rpm for Flange P is caused by LPT plane unbalance. A vibration maximum at an approximate N1 speed of 2500 rpm for Flange A and/or a high vibration at TAKEOFF (1.4 EPR) on Flanges A and P is caused by unbalance in the fan plane.

NOTE: These speeds are estimates and they come from test stand data. As your data base increases, you can adjust these estimates to make them more accurate.

(6) Find the angular location and the amount of 1EL, at each of the N1 speeds, at which a maximum vibration occurs. Make a polar graph of the results. Install CW1 by one of the methods that follows.

(a) If the polar graph shows a group of different points at which correction is necessary; then install CW1 at the center of the area which contains most of these points. This area must be within a 60 degrees angle and the moment weight quantity of the points within this area will vary by a maximum ratio of two to one.

(b) If no group of correction points exists, then install CW1 to reduce the maximum 1EL.

(7) Calculate the moment weight and the location of the first trial balance weight (CW1).

(a) Find the moment weight of CW1 by multiplying the value of the "as is" unbalance, Vector A (1EL), by the sensitivity (fan or LPT).

CW1 = sensitivity x 1EL

The sensitivity used for estimating the moment weight of CW1 is:

Fan 15 oz−in/mil (10800 g.mm/0.025 mm) Flange A
LPT 20 oz−in/mil (14400 g.mm/0.025 mm) Flange P

Example: If maximum Flange P vibration is 2 mils (0.051 mm) at 2800 rpm then an unbalance in the LPT plane is shown. Calculate the moment weight of CW1 as follows:

CW1 = 20 oz−in/mil (14400 g.mm/0.025 mm) x 2.0 mils (0.051 mm)

CW1 = 40 oz−in. (28800 g.mm)

(b) Align the ink marked fan blade (which shows the location of the short tooth) with the ink mark on the fan blade rubstrip (which shows the location of the N1 speed transducer).

(c) The correct location of CW1 is unknown if the phase angle lag is unknown. If a data base for the phase angle lag is available it can be used to find the location of CW1 (see optional procedure). If a data base for the phase angle lag is not available, then install CW1 at any angular location.

(8) Turn the low rotor and align the ink marked fan blade (reference for the short tooth) with the N1 speed transducer. Install the trail balance weight and record the location.

(9) Install the trial balance weight on the fan plane.

(a) Use an engine weight for the trial balance weight.

1 Use a Silver Pencil P05−018 and mark the inlet cone front segment and the inlet cone (rear) segment for alignment during installation.

2 Remove the six bolts and washers which hold the compressor inlet cone front segment to the compressor inlet cone (rear) segment.

3 Install an engine weight and use a cotter pin, or a rivet with a piece of tape, to hold the weight in position. See Table 1301.

RIVETED LPC FAN HUB COUNTERWEIGHTS

PART NUMBER/ CLASS	MOMENT WEIGHT WITH RIVET PN 534494	MOMENT WEIGHT WITH COTTER PIN PN MS9245−45
534493 CLS 1	2.0 oz−in. (1440 g.mm)	2.2 oz−in. (1584 g.mm)
534493 CLS 2	2.4 oz−in. (1728 g.mm)	2.5 oz−in. (1800 g.mm)
534493 CLS 3	2.8 oz−in. (2016 g.mm)	2.9 oz−in. (2088 g.mm)

Table 1301

RIVETED LPC FAN HUB COUNTERWEIGHTS

PART NUMBER/ CLASS	MOMENT WEIGHT WITH RIVET PN 534494	MOMENT WEIGHT WITH COTTER PIN PN MS9245-45
534495 CLS 1	4.9 oz-in. (3528 g.mm)	5.0 oz-in. (3600 g.mm
534495 CLS 2	5.3 oz-in. (3816 g.mm)	5.4 oz-in. (3888 g.mm)
534495 CLS 3	5.7 oz-in. (4104 g.mm)	5.8 oz-in. (4176 g.mm)
534495 CLS 4	6.1 oz-in. (4392 g.mm)	6.2 oz-in. (4464 g.mm)
534495 CLS 5	6.5 oz-in. (4680 g.mm)	6.6 oz-in. (4752 g.mm)
1B4294	12.8 oz-in. (9216 g.mm)	12.9 oz-in. (9288 g.mm)

Table 1301 (Continued)

4 Align the pencil mark on the inlet cone front segment with the pencil mark on the inlet cone (rear) segment. Install the cone front segment with six washers and bolts, lubricated with Engine Oil P03-001. Tighten and torque bolts to 45 - 50 lb-in. (5.084 - 5.649 N.m).

(10) Install the trial balance weight on the LPT plane.

(11) Do the vibration survey, see 71-00-00 Testing-08, Task 71-00-00-760-032 with the trial balance weight installed. Make a graph of the vibration and the N1 speed.

(12) If the vibration is less than the recommended guidelines, then go to the step that follows, and install the permanent counterweight(s).

(13) If the vibration is not within the recommended guidelines, then perform another trim balance survey. Calculate and install a second trial balance weight (CW2). If necessary, a third trial balance weight (CW3) can be installed.

NOTE: This calculation is done for each N1 speed and for each of the accelerometer locations.

(a) Make a polar graph of the "as is" 1EL and the phase angle. This is Vector A.

(b) Make a line for Vector R, which is equal and opposite (180 degrees) from Vector A. Vector R shows the effect that CW2 should cause.

(c) Make a line for Vector C, which shows the effect caused by CW1.

(d) Make a line for Vector D, which shows the vector difference between Vectors A and C. Subtract Vector C from Vector A and make Vector D with the arrow pointed to Vector C. Move Vector D to the origin of the polar graph.

(e) Calculate the moment weight and the location of the second trial balance weight (CW2).

1 CW2 = CW1 x A/D

2 Find the angle from Vector D to Vector R. Turn from CW1 by this same angle and direction for the location of CW2.

(f) An example of vector balance method follows.

1 A high level of 1EL at TAKEOFF (1.4 EPR) on Flanges A and P shows unbalance in the fan plane.

2 Make a polar graph of the "as is" 1EL and the phase angle. 1EL equals 2.6 mils (0.066 mm) at 60 degrees. This is Vector A. See Figure 1305.

3 Make a line for Vector R, which is equal and opposite (180 degrees) from Vector A. Vector R equals 2.6 mils (0.066 mm) at 240 degrees.

4 Calculate the moment weight of trial balance weight.

CW1 = Sensitivity x 1 EL

39 oz−in. (28080 g.mm) = 15 oz−in./mil
(10800 g.mm)/(0.025 mm) x 2.6 mils (0.066 mm)

5 Install CW1 at 10 degrees. Make a mark on the polar graph equal to 2.6 mils (0.066 mm) at 10 degrees.

NOTE: The correct location of CW1 is unknown if the phase angle lag is unknown. In this example, 10 degrees is used arbitrarily.

6 Operate the engine with the trial balance weight installed. Make a vibration survey. Make a graph of the vibration and the N1 speed. 1EL equals 2.0 mils (0.051 mm) at 340 degrees. This is Vector C.

7 Subtract Vector C from Vector A and make Vector D with the arrow pointed to Vector C. Move Vector D to the origin of the polar graph. Vector D equals 3.0 mils (0.076 mm) at 281 degrees.

8 Calculate the correct moment weight of CW2.

CW2 = CW1 x A/D

33.8 oz−in. (24336 g.mm) = 39 oz−in. (28080 g.mm) x 2.6 mils (0.066 mm)/3.0 mils (0.076 mm)

NOTE: Sensitivity can be calculated, at any speed point, by dividing the moment weight by the measured response. In this example 39 oz−in. (28080 g.mm)/3.0 mils (0.076 mm) = 13.0 oz−in. (9360. g.mm) per mil (0.025 mm).

9 Find the correct location for CW2. The angle between Vector D (281 degrees) and Vector R (240 degrees) is 41 degrees. Install CW2 at 41 degrees from the location of CW1, in the direction of Vector R. Remove CW1. Install CW2 at 329 degrees. This will cause Vector D to align with Vector R.

10 Find the phase angle lag, which is the angle between CW1 and effect of Vector D, measured in the opposite direction from which the engine turns. Phase angle lag in this example is 89 degrees

(g) This data can be used for increased accuracy on future trim balance attempts, see optional procedure.

(14) Remove the trial balance weights and install the permanent counterweight(s).

(a) Install the counterweights on the fan plane.

1 Use a Silver Pencil P05−018 and mark the inlet cone front segment and the inlet cone (rear) segment for alignment during installation.

2 Install the counterweight(s) with a rivet. Use a PWA 85234 Riveter to make a 0.125 inch (3.175 mm) diameter head on the rivet. See Figure 1306.

NOTE: Vibro peen the letters "TB" on the inner diameter face of all the trim balance counterweights.

3 Align the pencil mark on the inlet cone front segment with the pencil mark on the inlet cone (rear) segment. Install the cone front segment with six washers and bolts, lubricated with Engine Oil P03−001. Tighten and torque bolts to 45 − 50 lb−in. (5.084 − 5.649 N.m).

(b) Install the counterweights on the LPT plane. See Figure 1307.

1 Determine the quantity of LPT blade clip−on counterweights. See Table Table 1302.

LPT BLADE COUNTERWEIGHT

PART NUMBER	ATTACHMENT METHOD	MOMENT WEIGHT oz−in (g−mm)
50N401	CLIP−ON TYPE	4.30 oz−in. (3096 g.mm)

NOTE: The clip−on weight (50N401) attaches to the LPT 6th stage blade shroud. The quantity is as required with a maximum number of 10 clip−on weights per engine.

Table 1302

CAUTION: MAKE SURE THAT ALL LOOSE COUNTERWIEGHTS THAT ARE REMOVED FROM THE 6TH STAGE LPT BLADES ARE REMOVED FROM THE ENGINE. IF THEY ARE NOT REMOVED FORM THE ENGINE, DAMAGE TO THE ENGINE CAN OCCUR WHEN THE ENGINE IS STARTED.

(c) If it is necessary by the computer balance solution, first remove the old LPT clip on counterweights from the 6th stage blades with a PWA 101024 Drift as follows:

1 Put the chisel tip end of the PWA 101024 Drift under the hook tab of the counterweight at the leading edge of the 6th stage blade.

2 Push on the handle end of the Drift to unbend the counterweight from the leading edge of the blade.

3 Remove the loose counterweight from the 6th stage blade with mechanical fingers.

4 Take all the removed counterweights and tools out of the engine. Discard the used counterweights.

(d) Install the clip−on counterweight(s) to the 6th stage turbine shroud. See Figure 1307 (Sheet 1) and Table 1302. Two methods are provided for the installation of the clip−on counterweight:

1 Attach the counterweights with a PWA 86302 Hydraulic Bender and a PWA 76855 Hydraulic Pump. See Figure 1307 (Sheet 2).

2 Attach the counterweights with a PWA 102335 Mechanical Bender as follows. See Figure 1307 (Sheet 3) and Figure 1307 (Sheet 4).

a Put the counterweight on the counterweight holder of the PWA 102335 Mechanical Bender.

CAUTION: DO NOT BEND THE COUNTERWEIGHT TABS WHEN YOU HOLD THE COUNTERWEIGHT IN THE MECHANICAL BENDER. IF YOU BEND THE TABS, YOU WILL NOT BE ABLE TO INSTALL THE COUNTERWEIGHT ON THE 6TH STAGE TURBINE BLADE.

b Operate the quick grip handle to lightly hold the counterweight. Do not squeeze the quick grip handle too much so that you bend the counterweight tabs.

c Put the PWA 102335 Mechanical Bender with the counterweight on the airfoil section of the designated 6th stage turbine blade(s).

d With the counterweight still installed in the bender, slide the counterweight along the airfoil onto the blade outer shroud. Make sure the counterweight hook goes around the leading edge of the blade.

e To attach the counterweight to the blade, operate the quick grip handle to bend the tab. Operate the quick grip handle until it hits the bar stop.

f Release the quick grip handle and remove the PWA 102335 Mechanical Bender from the engine.

(15) Remove the test equipment from the engine.

(16) Install two bolts and nuts, lubricated with Engine Oil P03−001 to Flange P at the accelerometer bracket location. Torque the nuts to 180 − 200 lb−in 22.597 N.m).

NOTE: Install the bolts with the heads toward the front of the engine.

(17) Optional procedure.

(a) Record the phase angle lag and the sensitivity data and refer to it during subsequent trim balance. Instead of an arbitrary location for the installation of the first counterweight (CW1), phase angle lag data can be used.

(b) For example, if the data base shows phase angle lag of 90 degrees, then locate CW1 90 degrees from Vector R (240 degrees), in the direction of rotation. This results in a CW1 location which is as good as CW2 location, in the previous example.

CW1 = Data trend sensitivity X 1EL

NOTE: Sensitivity can be calculated, at any speed point, by dividing the moment weight by the measured response. In this example 39 oz−in. (28080 g.mm)/3.0 mils (0.076 mm) = 13.0 oz−in. (9360 g.mm) per mil (0.025 mm).

POWER PLANT GENERAL - TESTING-19

Task 71-00-00-760-052:

2. Test No. 19 - Sommervaille Three Weight Method

A. General

(1) See Test No. 19 - Trim Balance, Task 71-00-00-760-043 for optional procedure.

(2) See Test No. 19 - Optional "P" Flange Location For Low Rotor (N1) Trim Balance Procedure, Task 71-00-00-760-057 for optional procedure.

B. Equipment And Materials

Standard Tools:

Standard N1 Tachometer

Standard Vibration Monitoring Equipment	CEC 4-123 Pickup and PWA 156-4 Meter or equivalent. GR 1564-A Wave Analyzer to determine 1EL vibration amplitudes. or equivalent.

Special Tools:
PWA 85234 Riveter, Hand (For LPC counterweights)
PWA 85703 Accelerometer And Lead Assembly (2 Required)
PWA 85774 Bracket, Accelerometer (P Flange)

C. General Trim Balance Specifications

(1) Engines whose rotating parts are balanced as required by subassembly section of this manual will normally have some residual unbalance which will result in detectable vibration at engine operating conditions. This vibration may be minimized by trim balancing, which entails addition of weight positioned to offset residual unbalance in compressor front balance plane. Trim balancing can be accomplished on engine as mounted in test cell.

(2) Engines that experience stable overall vibration levels which are within limits of this section may be trim balanced in order to further reduce low rotor oriented (1EL) outputs. Stable vibration is defined as any vibration whose peak amplitude after thirty (30) seconds of stabilized running does not vary more than 0.5 mils (0.0127 mm).

(3) Trim balance should not be used to mask fundamental engine problems.

(4) The total vector sum of the trim balance weights and the weights installed for component (LPC) balance must not be more than the limits that follow:

  (a) Fan plane: 50 oz−in. (36,000 g.mm)

  (b) LPT: 48 oz−in. (34,560 g.mm)

  (c) Engines that require more correction weight than allowed should be inspected for incorrect assembly and/or part damage.

(5) For ease of identification in the field, all trim weights should be permanently identified with the letters "TB".

D. Procedure

(1) The Sommervaille three weight method requires four trial runs of the engine. An "As−Is" run and three "Calibration" runs (using a trial weight). The responses measured in all cases are 1EL vibration amplitudes (in mils (mm)), at selected N1 speed points. Balance weights available for this procedure are listed by part number and class in Table 1303. This procedure may be used to determine the amount and location of the unbalance, and the amount and location of the corrective weight. In this procedure, the word amplitude means balance displacement in mils (mm).

Trim Balance Weights
Fan Balance Flange Radius is 13.342 Inches (338.887 mm)

PART NUMBER	MOMENT WEIGHT
584944 Class 1	5.163 oz−in. (3717 g.mm)
584944 Class 2	5.617 oz−in. (4044 g.mm)
584944 Class 3	6.071 oz−in. (4371 g.mm)

Table 1303

Trim Balance Weights
Fan Balance Flange Radius is 13.342 Inches (338.887 mm)

PART NUMBER	MOMENT WEIGHT
(CONTINUED)	
584944 Class 4	6.498 oz−in. (4679 g.mm)
584944 Class 5	6.951 oz−in. (5005 g.mm)
584944 Class 6	5.550 oz−in. (3996 g.mm)
534493 Class 1	1.9 oz−in. (1368 g.mm)
534493 Class 2	2.3 oz−in. (1656 g.mm)
534493 Class 3	2.6 oz−in. (1872 g.mm)
534495 Class 1	4.7 oz−in. (3384 g.mm)
534495 Class 2	5.1 oz−in. (3672 g.mm)
534495 Class 3	5.6 oz−in. (4032 g.mm)
534495 Class 4	6.0 oz−in. (4320 g.mm)
534495 Class 5	6.4 oz−in. (4608 g.mm)

NOTE: The above weights can be installed on the fan hub balance flange to trim balance engine. These are permanent weights, but can be temporarily attached to the balance flange by using a cotter key (HG 34−1).

Table 1303 (Continued)

(a) Choose at least three N1 speeds with a fair amount of unbalance for the "As−Is" run. Record 1EL vibration amplitudes and N1 speeds. Using the "As−Is" 1EL amplitude as the radius, plot a entered circle on a polar coordinate chart. Use separate polar charts for each pickup (Flange A and Flange P) and speed combination.

(b) Arbitrarily ink−mark the rotor. The rotor is now indexed, and all references will be made from TDC. Choose three trial weight locations on the rotor approximately 120 degrees apart, and identify them serially as No. 1, 2, and 3. Locate and mark these three locations on the polar chart "As−Is" circumference.

(c) Place the trial weight (22 oz−in. (15840 g.mm) at the No. 1 location. Run the engine and record 1EL vibration amplitudes at the same speeds as in the "As−Is". From location No. 1 on the polar chart, swing an arc equal in radius to the vibration amplitude.

(d) Relocate the trial weight to location No. 2, and repeat (c) using No. 2 position and amplitude.

(e) Relocate the trial weight to location No. 3, and repeat (c) using No. 3 position and amplitude.

(f) Draw a vector from the polar chart origin to the center of the triangle formed by the three arcs. (Or the common intersection of the three arcs.) This vector indicates the angular location of the correcting weight. Its magnitude is inversely proportional to the magnitude of the correcting weight. To determine the magnitude of the correcting weight, use the formula:

$$M = \frac{MoV}{T}$$

Where: M = Balancing Weight or moment required.
Mo = Moment or Test weight.
V = Initial (As−Is) vibration amplitude
T = Resultant vector

M and Mo may be in grams, ounces, oz−in.
V and T are in mils (mm)

(g) The correct trim balance weight(s), see Table 1304, should be permanently installed on the fan balance flange at the correct angular location as determined in step (f). Record the quantity and part number of weights installed. Secure weights using PN 534494 rivet. Rivet counterweights using PWA 85234 Riveter. See 70−43, Standard Practices Manual, PN 585005.

NOTE: Trial weights may be placed on balance flanges using cotter key (HG 34−1).

(2) The following example describes a detailed procedure to illustrate the Sommervaille method. See Figure 1308.

(a) Three N1 speeds, with the most significant amounts of unbalance, are selected for "As−Is" run. The "As−Is" 1EL amplitude is used as the radius of a circle (1308/A) centered on a polar−coordinate chart. In this example, the 1EL vibration amplitude is 3.3 mils (0.084 mm), and the speed for this run is designated Speed 1.

(b) Arbitrarily ink mark the rotor at three equally spaced locations (120 degrees apart), and identify as 1, 2, and 3.

(c) Trial weight 22 oz−in. (15840 g.mm) is placed at Location 1. Run engine at same speeds as chosen in "As−Is" run. From Location 1 on polar chart, swing an arc equal in radius to vibration amplitude (1308/B). In this example, vibration amplitude equals 7.3 mils (0.185 mm), with weight at Location 1. Remove trial weight.

NOTE: Trial weight may be several engine weights whose total equal approximately 22 oz−in. (15840 g.mm).

(d) Repeat step (c), but apply procedure to Location 2. In this example, vibration amplitude equals 5.5 mils (0.140 mm), with weight at Location 2 (1308/C).

(e) Repeat step (c), but apply procedure to Location 3. In this example, vibration amplitude equals 2.8 mils (0.071 mm), with weight at Location 3 (1308/D).

(f) Three arcs drawn on polar coordinate chart form a triangle or share a common intersection. Draw a vector from origin to either center of triangle or point of common intersection. In this example, resultant vector equals 4.4 mils (0.112 mm). This vector indicates the necessary correction. Vector magnitude is inversely proportional to moment magnitude, use formula:

$$M = \frac{MoV}{T}$$

Where: M = Moment Required
Mo = Moment or Test weight.
V = Initial (As−Is) vibration amplitude
T = Resultant vector

In this example:

Mo = 22 oz−in. (15840 g.mm)
V = 3.3 mils (0.084 mm)
T = 4.4 mils (0.112 mm)

POWER PLANT GENERAL − TESTING−19

$$M = \frac{(22)(3.3)}{(4.4)} \quad \frac{(15840)(0.084)}{(0.112)}$$

M = 16.5 oz−in. (11,880 g.mm)

The correction weight must produce a moment equal to 16.5 oz−in. (11,880 g.mm), when installed.

(g) Referring to polar chart, position the correction weight at 35 degrees from Location 3 toward Location 2. Correct weight should be permanently installed on fan hub balance flange, located behind compressor inlet cone, using PWA 85234 Riveter .

NOTE: If a module balance weight is installed at the same location as that determined for trim balance weight, then install trim balance weight as close as possible to this location.

(3) During trim balance, a correction weight for vibration at one speed may adversely affect the vibration at another speed. If these vibration modes require corrective balance at different angular locations and magnitudes, a compromise trim balance may be attempted. This procedure consists of determining the required weight (magnitude and location) and sensitivity for each point under consideration, using normal trim balance procedure. This data is then plotted to determine a compromise vector representing the optimum correction. See Figure 1309. The following example describes a detailed procedure to illustrate compromise balance procedure. See Figure 1309.

(a) After engine trim balance, the data is found as follows in Table 1304:

EXAMPLE − TRIM BALANCE DATA

N1 SPEED	REQUIRED BALANCE WEIGHT	ANGLE	MODE SENSITIVITY
1300	2.0 oz−in. (1440 g.mm)	150	1.11 oz−in./mil (799 g.mm/ 0.025 mm)
2000	3.2 oz−in. (2304 g.mm)	130	1.45 oz−in./mil (1044 g.mm/0.025 mm)

Table 1304

EXAMPLE - TRIM BALANCE DATA

N1 SPEED	REQUIRED BALANCE WEIGHT	ANGLE	MODE SENSITIVITY
2400	2.6 oz-in. (1872 g.mm)	70	1.30 oz-in./mil (936 g.mm/0.025 mm)
3400	4.0 oz-in. (2880 g.mm)	160	2.50 oz-in./mil (1800 g.mm/0.025 mm)

Table 1304 (Continued)

(b) On a polar chart, plot vectors representing the required weight (magnitude and angle) for each speed point. These are the correction vectors for each speed point.

(c) Multiply the sensitivity of each point (oz-in./mil or g.mm/mm) by vibration limit (mils or mm). This figure represents the moment weight required to cause a vibration equal to vibration limit. Each correction vector (tip) on polar chart is the point at which that mode is perfectly balanced. Draw a circle from vector tip, whose radius is equal to mode sensitivity times vibration limit. A compromise vector falling anywhere within this circle area will cause a response within the vibration limit. A compromise vector closer to the circle's center will result in a vibration response closer to zero, for that speed. In this example, the vibration limit will be 1.5 mils (0.038 mm) 1EL and the data is found as follows in Table 1305:

EXAMPLE - COMPROMISE TRIM BALANCE DATA

N1 SPEED	SENSITIVITY	VIBRATION LIMIT	MOMENT WEIGHT
1300	1.11 oz-in./mil (799 g.mm/ 0.025 mm)	X 1.5 mils (0.038 mm)	= 1.7 oz-in. (1224 g.mm)
2000	1.45 oz-in./mil (1044 g.mm/0.025 mm)	X 1.5 mils (0.038 mm)	= 2.2 oz-in. (1584 g.mm)
2400	1.30 oz-in./mil (936 g.mm/0.025 mm)	X 1.5 mils (0.038 mm)	= 2.0 oz-in. (1440 g.mm)
3400	2.50 oz-in./mil (1800 g.mm/0.025 mm)	X 1.5 mils (0.038 mm)	=3.8 oz-in. (2736 g.mm)

Table 1305

(d) Draw a compromise vector that begins at polar chart origin and ends at center of area of common intersection for all circles. This compromise vector represents location and magnitude of compromise balance weight. In this example, 2.00 oz−in. (1440 g.mm) at 110 degrees.

NOTE: If no common area of intersection exists for all circles, then no weight can be added to lower all modes below vibration limit.

Task 71−00−00−760−057:

3. Test No. 19 − Optional "P" Flange Location For Low Rotor (N1) Trim Balance Procedure

A. General

(1) This Trim Balance installs vibration accelerometers on "P" flange at optional locations of 3:30 or 9:00 o'clock in addition to the accelerometer on A flange. See Task 71−00−00−760−043 for all other information.

(2) See Test No. 19 − Trim Balance − Task 71−00−00−760−043 for optional procedure.

(3) See Test No. 19 − Sommervaille Three Weight Method, Task 71−00−00−760−052 for optional procedure.

B. Equipment And Materials

Special Tools:
PWA 85703 Accelerometer And Lead Assembly (2 Required)
PWA 85774 Bracket, Accelerometer (P Flange)
PWA 86140 Harness Assembly

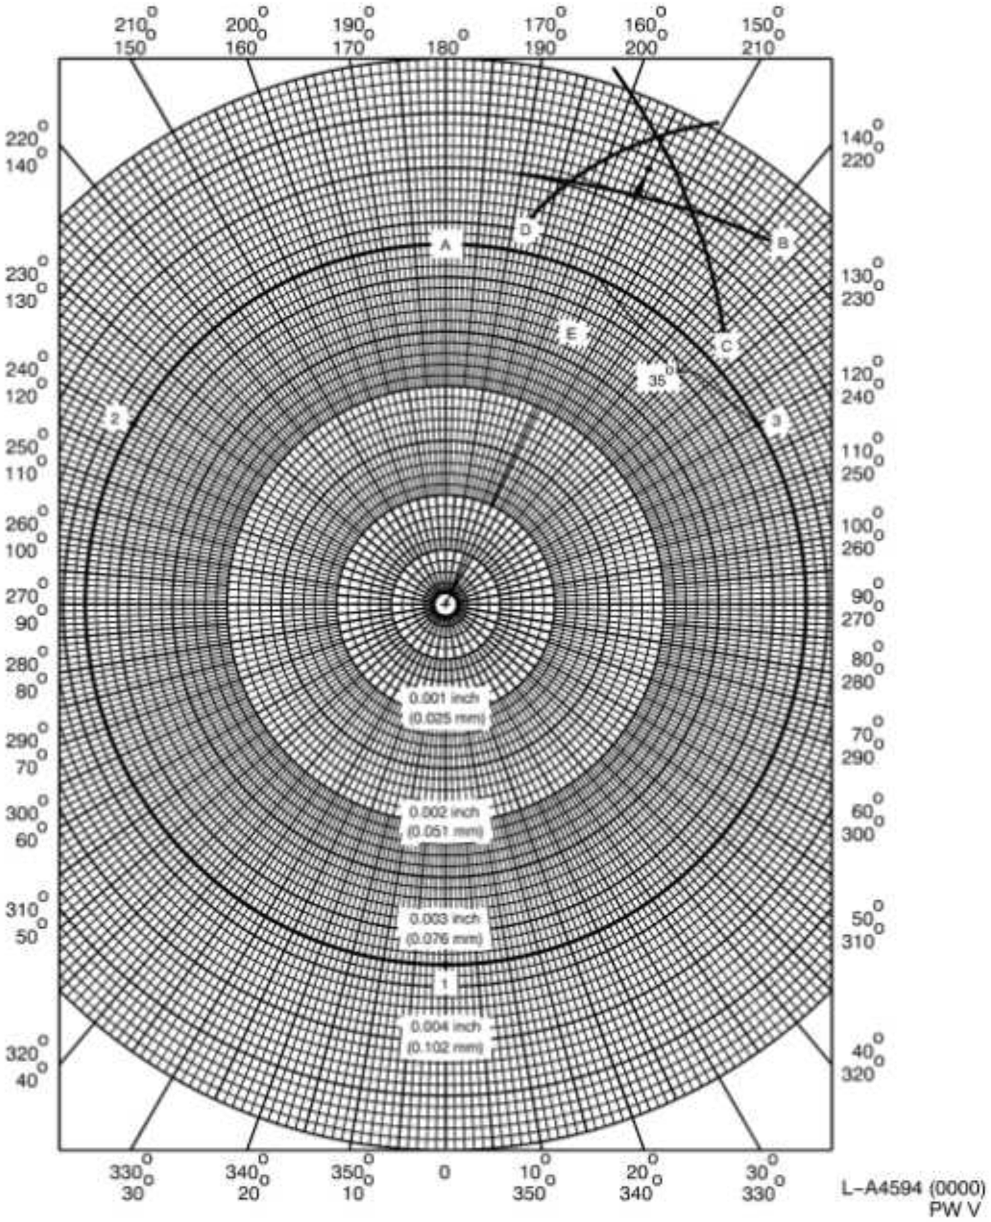
Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)

C. Procedure

(1) Install the accelerometers (vibration transducers) on Flange "P" as follows:

(a) Flange A bracket: See Task 71−00−00−760−043.



Sommervaille Three Weight Method

Figure 1309
(Task 71-00-00-760-052)

(b) Flange "P" bracket for Post SB PW4ENG 79−76 (rerouting of the No. 4 bearing pressure and oil tubes) engines: Install a PWA 85774 Bracket on Flange "P" at the 3:30 o'clock position as viewed from the rear of the engine. Install on the rear side of flange in bolt holes No. 38 and 39 located clockwise from the 12:00 o'clock position. Bolt hole No. 38 is the first bolt hole location below the existing 8 bolt nut plate bracket at the 3:00 o'clock position as viewed from the rear. See Figure 1310 (Sheet 1).

(c) Flange "P" bracket for Pre SB PW4ENG 79−76 engines: Install a PWA 85774 Bracket on Flange "P" at the 9:00 o'clock position as viewed from the rear of the engine. Install on the rear side of flange in bolt holes No. 33 and 34 located counterclockwise from the 12:00 o'clock position. See Figure 1310 (Sheet 2).

NOTE: As an option you can install the vibration bracket at the 3:30 o'clock location for pre SB PW4ENG 79−76 engines. See the paragraph (c) above for bracket installation

(d) Install a PWA 85703 Accelerometer And Lead Assembly to the PWA 85774 Bracket on Flange P.

(e) Install accelerometer leads along tubes and harnesses, and attach every 12 − 16 inches (305. − 406. mm). Do not install on tubes which contain hot bleed air. Install accelerometer leads so that they will not touch the closed nacelle doors.

(2) Install the trim balance equipment. See Figure 1311.

NOTE: The P Flange transducer is located at the 3:30 or 9:00 o'clock position and the Flange A transducer is located at the 12:30 o'clock position as viewed from the rear of the engine. If the N1 speed transducer is used: N1 signal comes from the N1 speed transducer on either the Channel A connector J19 pins "1" and "2" or the Channel B connector J19 pins "4" and "5".

(a) Install a PWA 86140 Harness Assembly to the N1 probe connector and plug it into the isolation amplifier/vibration analyzer equipment.

NOTE: An isolation amplifier may not be required dependent upon the model/type of the vibration analyzer used.

(b) Attach Flanges A and P vibration PWA 85703 Accelerometer Wire Leads, at two places, into the charge amplifier/vibration analyzer equipment

NOTE: The N1 signal characteristics are: The minimum, no load, equals one volt. The maximum, no load, equals 30 volts. The frequency (Hz) equals N1 rpm (from the short tooth signal).

(3) Do the trim balance procedure as shown in Task 71−00−00−760−043.

(4) After the trim balance procedure, remove the test equipment from the engine.

(5) Install two bolts and nuts, lubricated with Engine Oil P03−001 to Flange P at the accelerometer bracket location. Torque the nuts to 180 − 200 lb−in. (20.337 − 22.597 N.m).

(a) Install the bolts, with the heads toward the front of the engine.

(b) Torque the nuts to 180 − 200 lb−in. (20.337 − 22.597 N.m).

Task 71−00−00−380−002:

4. Test No. 19 − Lubrication Of The Stage 1 LPC (Fan) Blade Roots To Reduce N1 Vibration

A. General

(1) Use this procedure to decrease a small quantity of N1 rotor unbalance that is not stable in the test cell. This type of vibration changes from engine run to engine run at the same N1 speeds when no change in balance weight or rotor parts has been made.

(2) If the N1 rotor vibration amplitude and/or phase angle is not stable, lubrication of the Stage 1 LPC (fan) blades (called fan blades) roots (dovetail areas) can be necessary.

(3) Lubrication of the fan blades roots can also be necessary if the fan blades operational time or cycles is more than the recommended lubrication interval.

B. Equipment And Materials Necessary

Standard Tools:
Brush Used For The Application Of Lubricant P06−005

Consumable Materials:

Item No.	Designation
P06−005	Lubricant (Optional To P06−044)
P06−044	Compound, Antigallant (Optional To P06−005)

C. Procedure To Lubricate The Fan Blade Roots To Reduce N1 Vibration

(1) Remove the compressor inlet cone by 72−00−31 Removal−02 (Task 72−00−31−020−001).

(2) Choose one of the two antigallant compounds that are available for this procedure.

(a) A cure time is not necessary for Lubricant P06−005. The fan blades can be removed one at a time for the application of the lubricant or the complete set of fan blades can be removed for the application.

(b) A 4 hour cure time is necessary for Antigallant Compound P06−044. You must remove the complete set of fan blades for the application so that the compound can cure before reinstallation.

CAUTION: YOU MUST REMOVE THE FAN BLADES TO APPLY THE LUBRICANT CORRECTLY. IF YOU DO NOT, YOU CAN MAKE THE VIBRATION WORSE.

(3) Apply Lubricant P06-005 (Optional to P06-044) to each fan blade root, one blade at a time, as follows:

NOTE: A cure time is not necessary for Lubricant P06-005.

(a) Remove the No. 1 fan blade from the hub. See 72-00-31 Removal-03 (Task 72-00-31-020-002-001).

(b) Use a cloth and remove any dirt or grit from the fan blade root area and the hub blade slot. As an option, clean the blade root area and the hub blade slot by SPOP 208 (Task 70-21-00-110-040), see the Standard Practices Manual, PN 585005 and see Figure 1312.

1 Do not try to remove the existing coating.

2 Do not try to polish the metal.

(c) Use a clean brush and apply Lubricant P06-005 to the dovetail area only on the fan blade root. See Figure 1312.

1 Do not apply lubricant to the fan hub slots.

2 Do not apply lubricant to the fan blade fairing seal areas (flowpath lines). Lubricant is not permitted on the fairing seal areas.

3 Do not apply lubricant to the bottom face of the fan blade root. Lubricant is not permitted on the bottom face of the fan blade root.

4 Some lubricant is permitted on the area between the dovetail area and the flowpath line.

5 Remove the excess lubricant.

(d) Install the No. 1 fan blade to the hub. See 72-00-31 Install-03 (Task 72-00-31-420-002-001).

(e) Continue to remove, lubricate and reinstall one at a time, all of the remaining fan blades.

(4) Apply Lubricant P06-005 (Optional to P06-044) to the fan blade roots, with all the fan blades removed first, as follows:

NOTE: A cure time is not necessary for Lubricant P06-005.

(a) Make a mark and record the location of each fan blade and fairing in the hub as shown in the procedure 72-00-31 Removal-03 (Task 72-00-31-020-002-001). See Standard Practices Manual, PN 585005 Section 70-11-00 for approved temporary markers.

(b) Remove all the fan blades and fairings from the hub as shown in the procedure 72-00-31 Removal-03 (Task 72-00-31-020-002-002).

(c) Use a cloth and remove any dirt or grit from the fan blade root area and the hub blade slot. See Figure 1312.

1 Do not try to remove the existing coating.

2 Do not try to polish the metal.

(d) Use a clean brush and apply Lubricant P06-005 to the dovetail area only on the fan blade root. See Figure 1312.

1 Do not apply lubricant to the fan hub slots.

2 Do not apply lubricant to the fan blade fairing seal areas (flowpath lines). Lubricant is not permitted on the fairing seal areas.

3 Do not apply lubricant to the bottom face of the fan blade root. Lubricant is not permitted on the bottom face of the fan blade root.

4 Some lubricant is permitted on the area between the dovetail area and the flowpath line.

5 Remove the excess lubricant.

(e) Install all the fan blades and fairings to their correct slot locations in the hub. See 72-00-31 Install-03 (Task 72-00-31-420-002-002).

(5) Apply Antigallant Compound P06-044 (Optional to P06-005) to each fan blade root as follows:

NOTE: A 4 hour cure time is necessary for Antigallant Compound P06-044.

(a) Make a mark and record the location of each fan blade and fairing in the hub as shown in the procedure 72-00-31 Removal-03 (Task 72-00-31-020-002-002). See Standard Practices Manual, PN 585005 Section 70-11-00 for approved temporary markers.

(b) Remove all the fan blades and fairings from the hub as shown in the procedure 72-00-31 Removal-03 (Task 72-00-31-020-002-002).

(c) Use a cloth and remove any dirt or grit from the fan blade root area and the hub blade slot. See Figure 1312.

1 Do not try to remove the existing coating.

2 Do not try to polish the metal.

(d) Apply the spray-on Antigallant Compound P06-044 to the dovetail area only on the fan blade root. See Figure 1312.

1 Do not apply antigallant compound to the fan hub slots.

2 Do not apply antigallant compound to the fan blade fairing seal areas (flowpath lines). Antigallant compound is not permitted on the fairing seal areas.

3 Do not apply antigallant compound to the bottom face of the fan blade root. Antigallant compound is not permitted on the bottom face of the fan blade root.

4 Some antigallant compound is permitted on the area between the dovetail area and the flowpath line.

(e) Let the antigallant compound cure for 4 hours minimum at 70°F (21.1°C) minimum before installation of the fan blades in the hub.

(f) Install all the fan blades and fairings to their correct slot locations in the hub. See 72-00-31 Install-03 (Task 72-00-31-420-002-002).

(6) Install the compressor inlet cone by 72-00-31 Install-02 (Task 72-00-31-420-001).

(7) Continue the 71-00-00 Test No. 19 - Trim Balance Procedure and Test (Task 71-00-00-760-043).

POWER PLANT GENERAL - TESTING-20

Task 71-00-00-760-034:

1. Test No. 20 - Cold Engine Fuel Spike Stability Test

A. General

NOTE: This procedure has been deleted, refer to Testing-21, (Task 71-00-00-760-065) for the Cool Engine Fuel Spike Stability Test.

Previous Pageblock Return to Previous Menu Next Pageblock

Task 71-00-00-760-065:

1. Test No. 21 - Cool Engine Fuel Spike Stability Test

A. General Specifications and Requirements

NOTE: PW4000-94 Engines incorporating HPC Cutback Stator configuration per SB PW4ENG 72-704, that have not been converted to HPC non-Cutback Stator configuration, are not required to do Testing-21.

(1) Use this procedure to verify that the engine has satisfactory high pressure compressor surge margin for return to service. Refer to 71-00-00, Testing-00, the Test Requirements After Engine/Module/Component Repair or Replacement (Task 71-00-00-990-003) and look at the Test Reference Table 1302, to determine if the engine workscope during this shop visit requires Testing-21. This test can also be used for an engine just removed from the wing for a high pressure compressor surge margin verification. This test must not be used to return an engine to service that was confirmed to have experienced a Group 3 surge event.

(2) Before the special PWA Tool Surge Margin Analysis Control (SMAC-2) can be used, the test cell data system must be modified and validated by Pratt & Whitney.

(a) For most test cell configurations, these changes will be limited to software changes to the test cell computer.

(b) The necessary changes must be done by a person familiar with the specific test cell computer that will be modified and familiar with the ARINC 429 specification.

(c) The test cell modification includes three basic Tasks as follows, Refer to Figure 1301 for Block Diagram and Figure 1302 for Input/Output Spike EEC Control.

1 Task 1: Test cell computer update to ARINC data bus TCC(AI)/TMC or FMC(TBC)/FCC(MD).

2 Task 2: "Spiker Control Panel/User Interface" selects content of additional ARINC labels that control SMAC-2 functions that are necessary for the cool engine fuel spike stability test. Based on the computer test cell configuration, the implementation of this function can vary greatly.

3 Task 3: Monitoring of SMAC-2 feedback status word OL 277 to make sure control is functioning correctly. Refer to Figure 1305.

(3) The operation of the Cool Engine Fuel Spike Stability Test system must be periodically checked to verify correct operation. P&W will support the initial checkout of the test cell and computer software changes to make sure that the system is working correctly and that the engine test results are satisfactory in order to validate a test cell for Testing-21.

(4) Once the test cell has been modified and qualified as "Testing-21" capable, the requirements for this test must be accomplished on all engines that are required to do this test by the Test Reference Table 1302 of 71-00-00 Testing-00.

(5) Fan Thrust Deterioration Mode Testing-21 Requirement

NOTE: For engines with Phase 0/FB2T or Phase 1/FB2B fan blade configurations, the engine must be tested in the non-Fan Thrust Deterioration Mode (non-FTDM). To demonstrate that the fan does not have FTDM, do the steps that follow before you do Testing-21.

(a) Do the steps necessary in the PW4152 Series Engine Manual, PN 50A443 Engine Acceptance Test, 71-00-00, Testing-09 (Task 71-00-00-760-020), Paragraph M, in order to determine if the engine fan operation is normal or abnormal in accordance with the procedures shown in step 1. O. "Check Corrected Data". Parameter shifts shown in 71-00-00, Testing-09 step 1. O. (3) are used to determine if engine fan operation is normal or abnormal. If parameters are abnormal, FTDM exists and action must be taken with one of the procedures in step (5) (c), to correct fan condition before you do Testing-21. Repeat this step to demonstrate that Fan corrective action resulted in non-FTDM condition.

(b) Alternate 2-Point Calibration Procedure to Test for Fan Thrust Deterioration Mode (Alternate to Step (5), (a))

NOTE: The purpose of this procedure is to establish an alternate method to determine if an engine has or has not developed fan Thrust Deterioration Mode (FTDM). Current Engine Manual procedures for identifying FTDM require that a 4-point acceptance calibration be performed. Refer to Engine Acceptance Test, 71-00-00, Testing-09 (Task 71-00-00-760-020), requirements (with station 2.5 instrumentation) followed by analysis. This alternate procedure allows a shorter/simplified 2-point data method.

1 Data requirements

NOTE: Use the procedures in the Engine Manual, 71-00-00, Testing-09 (Task 71-00-00-760-020), Paragraph M., "Engine Acceptance Test" to get two steady state performance points at power levels of 1.55+/-0.01 and 1.45 +/-0.01 PT4.95/PT2.

a Accelerate engine to 1.55, stabilize for 5 minutes, take data point.

b Decelerate engine to 1.45, stabilize for 3 minutes, take data point.

c The parameters as follows are required as a minimum:

PT4.95/PT2
N1
N2
TT2

2 Analysis requirements

NOTE: Use the procedures defined in the Engine Acceptance Test, 71−00−00, Testing−09 (Task 71−00−00−760−020) "Correction Of Observed Data". Refer to Figure 1302 to calculate the data that follows:

a Corrected Low Rotor Speed (N1C), then calculate %N1C=N1C/36.

b Corrected High Rotor Speed (N2C), then calculate %N2C=N2C/99.

c Calculate %N1C/%N2C for both points.

d Calculate %N1C/%N2C baseline levels for each point with the equation that follows:

$$\%N1C/\%N2C\ \text{baseline}=(-0.49762) \times (PT4.95/PT2)^2 + (1.83988) \times (PT4.95/PT2) - (0.64163).$$

e Calculate % Delta relative to baseline (for 1.45 and 1.55 points).

$$\%\text{Delta}=(100) \times (\%N1C/\%N2C - \%N1C/\%N2C\ \text{baseline})/(\%N1C/\%N2C\ \text{baseline}).$$

f Assess data for FTDM condition using % Delta parameter.

Compare 1.45 and 1.55 PT4.95/PT2 power points.
If 1.55 power point is 1.5 percent or greater than the 1.45 power point, engine has FTDM. Refer to Figure 1308 for example of the upward shift expected when FTDM is present at high power.
If the engine demonstrates it has FTDM, corrective action must be taken with one of the procedures in step A. (5)(c) to correct problem before you do the fuel spike test sequence shown in Testing−21.
Following corrective action for FTDM, Steps 5. (b)1 and 2 must be repeated to verify that the corrective action taken was effective in eliminating the FTDM condition.

(c) Repair fan leading edge contour of Fan Blades with one of the methods: Engine Manual 72-00-31, Repair-01 (Task 72-00-31-300-001); or Engine Cleaning, Inspection, and Repair Manual 72-31-82, Repair-13 PW4000 Series CIR, PN 51A357; or Service Bulletin No. PW4ENG 72-732, as applicable based on fan blade part number; or Service Bulletin No. PW4ENG 72-655, as applicable based on fan blade part number.

(6) The engine need not have any special thermal history (i.e. specific shutdown period or engine operation that establishes a cold engine or warm engine thermal condition) prior to start of Testing-21.

(7) The Bill Of Material EEC (Electronic Engine Control) and EEC programming plug are removed from the engine for this test. A special PWA Tool Surge Margin Analysis Control (SMAC-2) with a special tool EEC programming plug is installed.

(8) It is possible that other tests are necessary before you do this test. Refer to 71-00-00 Power Plant General - Testing-00, Test Requirements After Engine/Module/Component Repair or Replacement, (Task 71-00-00-990-003). This procedure will also give the sequence for the necessary tests.

(9) If the Engine Acceptance Test - Testing-09 is necessary, you must do Testing-09 before you do Testing-21 or do Testing-21 in the correct sequence within Testing-09. Refer to the "Engine Run Schedule" in Testing-09, Figure 1301 for the necessary sequence.

(a) Testing-21 can only be run after the engine has passed the initial engine operational limits (oil system, vibration and secondary limits) shown in Testing-09. It must also be done after the necessary LPC/HPC break in testing shown in Figure 1301, Testing-09.

(b) To minimize control changes, it is possible to run the initial testing shown in Testing-09 with the SMAC-2 in the unarmed configuration and with the applicable PWA 103469 EEC Programming Plug as shown in step B., Equipment and Materials Necessary.

(c) After the successful completion of Testing−21 requirements, it is recommended that the engine be shutdown, the SMAC−2 be removed and the Bill of Material EEC and EEC Programming Plug be installed. Repeat Testing−07, −03, and −06 again to make sure the operation of the Bill of Material EEC is satisfactory. Continue with the remaining requirements of Testing−09. This procedure would result in the Acceptance Test being run with the same control that the engine will be returned to service with. Although running with the Bill of Material EEC is the recommended procedure, as an option the remainder of Testing−09 can be run with the SMAC−2 if set in the unarmed configuration. The SMAC−2 has the same logic (if set in the unarmed configuration) as the Bill of Material EEC.

(10) During Testing−21, Pratt & Whitney recommends that the test be documented. The purpose for documentation is to allow review of any Testing−21 test to confirm it was properly conducted.

(a) Make a record and keep these records of the data that follows:

1 Engine Serial Number, Model/Suffix

2 Engine Configuration, (NBS HPC (A1Ox or ZrOx), HPT 1st Vane Cutback, Phase I or Phase III Fan, etc.)

3 HPC Serial Number and Hours/Cycles Since New or Since Last Overhaul

4 FMU Part Number and Serial Number

5 Fuel Pump Part Number and Serial Number and Hours Since Last Overhaul

6 Testing−21 Test Date

7 Test Cell (for facilities with more than one test cell)

8 Test Cell Fan Duct Set Number/CONF (MAPNET setup parameter)

9 P Nozzle (MAPNET setup parameter)

10 TT2 and P (barometer) at start of test

11 EEC Programming Plug PN and suffix

(b) For each of the three Testing−21 fuel spikes (if all three conducted), provide the data that follows:

1 Time at Idle (xx Min:xx Sec)

2 Time to Fuel Spike (xx.x Sec)

3 EPR at Fuel Spike Initiate (1.xxx)

4 Goodness Bit Status (Octal Label 277, Bit 19) − Good/Bad

(c) Make a record of ARINC transient time history data (for those cells having this capability) for the ARINC parameters (Octal Label in parentheses) from the Channel−in−Control as follows:

1 EPRI (340), EPRCOM (341), N2A (344), N2DOT (300), P5I (132), P2E (131), WFRLRQ (334), T2E (130), PB (264), SVA (325), B25 (335), N2C25 (336), T5 (345), TRASL (133), N1A (346)

B. Equipment And Materials Necessary

Special Tools:

To do the cool engine spike test you will need one PWA 105321 SMAC−2 Control and one PWA 103469 EEC Programming Plug that is matched for the specific engine model/suffix that will be tested.

PWA 105321	Control, Surge Margin Analysis (SMAC−2)

The EEC Programming Plug utilized for Testing−21 for all PW4152 engine model/suffix configurations will allow the SMAC−2 control to command thrust operation above their respective rated thrust. This condition is acceptable during Testing−21 as these engines are capable of operating at a higher thrust level with no detrimental effect. No post−Testing−21 actions are required for these engine configurations after completing Testing−21.

PWA 103469−18	Plug, EEC Programming (For PW4152, PW4156A, PW4158)

Special Tools:

(CONTINUED)

PWA 103469-19	Plug, EEC Programming (For PW4152-3A, PW4156A-3A, PW4158-3A)
PWA 103469-20	Plug, EEC Programming (For PW4152-1E/1C, PW4156A-1E/1C, PW4158-1E/1C)
PWA 103469-21	Plug, EEC Programming (For PW4152-3, PW4156A-3 , PW4158-3)

The engine fuel system must be capable of delivering the required Fuel Spike. Certain FMU's can limit the fuel spike capability. Only use FMU PN's 55T423 or 50U150, or subsequent, during testing. Do not use low flow FMU PN's 51T217, or 53T419, or 53T510, or 55T678, or 53T335, or 50U149.

C. Procedures To Prepare For Test

(1) Disconnect the engine EEC programming plug and remove the engine EEC (Electronic Engine Control). Refer to 72-00-33, Removal-04, (Task 72-00-33-050-001).

(a) The EEC programming plug will stay attached to the engine by its lanyard and will not be used for this test. Install a protective cover on the EEC programming plug. Attach the EEC programming plug tightly to the engine with safety wire or wire ties so it will not be damaged during the test.

(2) Install the PWA 105321 Surge Margin Analysis Control-2 in place of the engine EEC on the fan case. See 72-00-33, Installation-04, (Task 72-00-33-450-001). Do not install the engine EEC programming plug.

(3) Make a selection for a PWA 103469 EEC Programming Plug. To make the selection go to the engine identification plate and get the engine model and suffix (if any). Go to the Special Tool list and find the necessary PWA 103469 EEC Programming Plug for the engine model/suffix that you are testing.

(a) EXAMPLE 1:

1 If "PW4152 (-3)" is marked on the engine identification plate, the configuration identifier suffix is "(-3)". Make a selection of a PWA 103469-21 EEC Programming Plug.

(b) EXAMPLE 2:

1 If "PW4158" is marked on the engine identification plate with no configuration identifier suffix, the configuration is Pre Phase 3. Make a selection of a PWA 103469-18 EEC Programming Plug.

D. Testing Prior to Stability Test

(1) Do the EEC static test. See 71-00-00, Test No. 7, EEC Static Test, (Task 71-00-00-760-038).

(2) You cannot do Testing-21 above the ambient temperature levels shown in Table 1301 due to the Testing-21 1.50 EPR target requirement exceeding the sea-level takeoff rating defined by the specified EEC programming Plug. If temperatures are above the levels shown in Table 1301, you cannot do the test until the temperatures are cooler.

EEC Programming Plug	Tamb Upper Limit
PWA 103469-18 Plug	106.7° F (41.5° C)
PWA 103469-19 Plug	106.7° F (41.5° C)
PWA 103469-20 Plug	106.7° F (41.5° C)
PWA 103469-21 Plug	106.7° F (41.5° C)

NOTE: Hot day ambient temperature limits to make allowance to get 1.50 target EPR.

Tamb Upper Limit For Testing-21
Table 1301

(3) Before the test with the engine not running, set the throttle to the target 1.50 EPR setting as follows:

NOTE: It is recommended that setting the 1.50 EPR TLA mark should be done as close in time as possible to the actual running of Testing-21 in order to minimize the chance of a change in the EPR versus TLA relationship due to the ambient temperature and pressure effects.

NOTE: In certain conditions where ambient temperature or ambient pressure are changing rapidly, it may be necessary to reset the target for a 1.50 EPR setting for each separate fuel spike event.

(a) Turn the ground test power on to the SMAC-2.

(b) If T2 < 30 degrees C, continue to (3)(d).

(c) If Tamb <= 30 degrees C and T2EEC indicates > 30 degrees C; Dry motor the engine until T2EEC < 30 degrees C and then continue to (3)(d). If however, Tamb > 30 degrees C do not dry motor and go to step (3)(f).

(d) Move the throttle forward until 1.50 EPR Reference is shown. Mark the angular location or set the throttle stop.

(e) This indexing procedure will work in setting the 1.50 EPR power requirements of the stability test if the PWA 105321 Surge Margin Analysis Control SMAC-2 is run in the "EPR" mode.

(f) If the PWA 105321 Surge Margin Analysis Control SMAC-2 is run in the "N1" mode, you will have to adjust the throttle down slightly when the engine operates.

(g) If the fuel system has not been checked for leaks before, do the Engine Motor Leak Test (Wet Method). See 71-00-00, Test No. 2A, (Task 71-00-00-760-010). Check for leaks with the starter, if necessary repair any leaks. Ignore step (3)(h) if you have completed step (3)(d), if not continue to step (3)(h).

(h) If Tamb > 30 degrees C, run the engine to 1.50 EPR and set the throttle stop. Then, return to idle and continue with Testing-21.

E. Cool Engine Fuel Spike Stability Test Procedure

CAUTION: NO SPECIAL PRE-TEST THERMAL HISTORY IS NECESSARY FOR TESTING-21. THE TEST CAN BE RUN AT ANYTIME DURING ENGINE RUNNING IF THE REQUIREMENTS OF TESTING-09 FIGURE 1301 HAVE BEEN MET IF REQUIRED (I.E. ENGINE BREAK-IN FOLLOWING LPC/HPC REPAIR, REPLACE OR NEW).

CAUTION: MAKE SURE THE TEST CELL COMPUTER SOFTWARE FOR TESTING-21 IS VALIDATED FOR SATISFACTORY OPERATION BY P&W BEFORE THE COOL ENGINE SPIKE TEST IS RUN. THE P&W REPRESENTATIVE WILL MAKE SURE THE SYSTEM WILL RUN THE ENGINE STABILITY TEST SATISFACTORILY. THIS MUST BE DONE PRIOR TO FIRST RUN OF TESTING-21 FOR EACH TEST CELL. ANY TIME THERE IS A SUBSEQUENT CHANGE TO THE TEST CELL STRUCTURE, OR COMPUTER HARDWARE OR SOFTWARE, P & W MUST BE CONTACTED TO DETERMINE IF RE-VALIDATION IS REQUIRED.

(1) The Cool Engine Fuel Spike Stability Test is a stand alone test supported by test cell computer software. The Engine Run Schedule is shown in Testing-21, Figure 1306. If the "Necessary Test" shown in the Test Reference Table - Engine, Modules and Primary Parts, Table 1302, (Task 71-00-00-990-003) require Testing-09, (Task 71-00-00-760-020) to be performed, Testing-21 must be performed in the sequence shown in Figure 1301, Testing-09. Testing-21 Figure 1306 shows the test sequence starting from an engine shutdown condition. Testing-21 can also be initiated with the engine running at idle condition.

NOTE: The requirement to operate the engine for a minimum of 20 minutes at SMAC-2 Idle must be satisfied if testing is interrupted between any of the individual fuel spikes.

(2) Start Testing-21 procedure with engine shutdown, Arm SMAC-2 Control.

(a) If the engine is already running, decelerate the engine to idle TLA setting and arm the SMAC-2 control. Then proceed to step E. (4).

(3) Start the engine by the Engine Start Procedure (Normal), (Task 71-00-00-760-003).

CAUTION: IF AN ENGINE SURGE OR STALL OCCURS DURING THIS TEST, YOU MUST MOVE THE THRUST LEVER TO MINIMUM IDLE WITHIN ONE SECOND OF THE SURGE OR STALL. DO THE PROCEDURES SHOWN IN TESTING-00 "PROCEDURE AFTER ENGINE SURGE OR STALL" (TASK 71-00-00-760-008). IF YOU DO

NOT DO THESE PROCEDURES, YOU CAN DAMAGE THE TURBINE TIP SEALS.

(4) Operate the engine at SMAC−2 IDLE for minimum of 20 minutes (−0/+ indefinite seconds) and then quickly advance the throttle in one second or less to the 1.50 EPR target. Use the throttle stop or reference mark that you set before the test.

(a) Closely monitor to make sure that the 1.5 EPR +/−0.01 EPR target is achieved before initiation any fuel spike. If during Testing−21, the target EPR is not achieved, Disarm fuel spike before initiation of spike, re−adjust the throttle stop to achieve 1.50 EPR +/−0.01 EPR. Return throttle to idle, re−arm the spike and repeat this part of the test (which includes 20 minute cool down at idle).

(b) For the time at idle requirement, start the timing at the gates shown on Run Schedule Figure 1306.

NOTE: If the engine is already running at stabilized idle, start the timing at the point when the SMAC−2 control is armed.

(c) SMAC−2 IDLE = Special idle speed (6000 RPM N2 corrected) which is activated when SMAC−2 is armed.

(d) 6000 RPM N2 corrected = 6000 RPM N2/SQRT ((T2EEC °C + 273.15)/288.15).

(5) Operate the engine at 1.50 EPR (± 0.01) for 40 seconds (± 3 seconds) and then do the cool engine fuel spike.

(a) For the time at 1.50 EPR requirements, start the timing at the gates shown on Run Schedule, Figure 1306.

(b) When the engine fuel spike initiated, the engine will automatically accelerate in speed due to the fuel spike introduced by the SMAC−2 and then return to 1.50 EPR power level.

NOTE: The change in N2 speed observed during the fuel spike should be a consistent RPM value for different engines tested.

(c) If the engine does a surge or a stall (a very loud booming noise with flames out the tailpipe) during the cool engine fuel spike immediately bring the throttle back to IDLE. Follow the procedures shown in Procedure After Engine Surge Or Stall, (Task 71-00-00-760-008). If the engine does a surge or a stall on any of the Testing-21 fuel spikes, the test is terminated, as the engine has not passed the test.

(6) If the engine does not surge or stall, continue to operate the engine at 1.50 EPR for a minimum of ten seconds following the fuel spike and then move the throttle to SMAC-2 idle power setting, engine will return to SMAC-2 idle N2 speed.

CAUTION: BIT 19 OF OCTAL LABEL (OL) 277 WILL ONLY BE SET FOR 60 SECONDS FOLLOWING INITIATION OF FUEL SPIKE. AFTER 60 SECONDS BIT 19 OF OL 277 WILL BE RETURNED TO "0" WHICH IS DEFINED AS "BAD". IT IS NECESSARY TO VISUALLY CONFIRM THAT THIS BIT IS SET TO "1" WHICH IS DEFINED AS "GOOD" IN EITHER CHANNEL A OR B FOLLOWING THE FUEL SPIKE IN ORDER TO VERIFY THAT THE FUEL SPIKE MAGNITUDE IS ACCEPTABLE.

(7) Visually make a check that the bit 19 of Octal Label (OL) 277 was set as a "1" which is defined as "good" in either channel A OR B following the fuel spike. This indicates that the fuel spike magnitude was correct and that testing may continue.

(a) If bit was set to "0" which is defined as "bad" in both Channel A AND B following the fuel spike, discontinue testing and take corrective action to resolve fuel spike magnitude out of allowable tolerance problem, then repeat test.

(8) Do steps E. (4) through E. (7) above activating fuel spike at 60 and 20 seconds, as shown in Engine Run Schedule Figure 1306.

(9) At idle engine power, disarm the SMAC-2 control. The engine will return to normal MINIMUM IDLE speed.

NOTE: Other engine test requirements may be done at this time or do an engine shutdown procedure, Refer to "Normal Shutdown Procedure", (Task 71-00-00-760-004).

F. Pass or Fail Criteria Of The Stability Test

(1) To pass the Cool Engine Fuel Spike Stability Test, the engine must not surge or stall during any of the fuel spike points at 40, 60, or 20 seconds, including verification that the bit 19 of Octal Label (OL) 277 was set as a "1" which is defined as "good" in either channel A OR B following each spike.

(2) The engine fails the Cool Engine Fuel Spike Test if it has a surge or stall during either the 40, 60, or 20 second fuel spike points independent of the value set by bit 19 of Octal Label 277 in channel A or B. The engine does not have satisfactory HPC surge margin and must not be returned to service.

G. Procedures Necessary After Testing

(1) Remove the PWA 105321 Surge Margin Analysis Control (SMAC−2) and PWA 103469 EEC Programming Plug from the fan case. See 72−00−33 Removal−04, (Task 72−00−33−050−001).

(a) As an option, the SMAC−2 can remain on the engine for any additional testing if set in the unarmed configuration.

NOTE: When running additional engine testing with the SMAC−2 unit in the un−armed mode, the EPR modifier (CDX) will be set to class 16.

(2) Install the engine Bill of Material EEC (Electronic Engine Control) on the fan case. See 72−00−33, Installation−04, (Task 72−00−33−450−001).

CAUTION: DO NOT INSTALL THE PWA 103469 EEC PROGRAMMING PLUG IN THE BILL OF MATERIAL ENGINE EEC (ELECTRONIC ENGINE CONTROL). YOU MUST INSTALL THE CORRECT ENGINE EEC PROGRAMMING PLUG IN THE BILL OF MATERIAL EEC. IF THE PWA 103469 EEC PROGRAMMING PLUG IS INSTALLED THE ENGINE WILL NOT OPERATE.

(a) Install the original engine EEC programming plug that is attached to the engine by its lanyard, Refer to 72−00−33, Installation−04, (Task 72−00−33−450−001).

(b) If the engine will continue with the Engine Acceptance Test − Testing−09, (Task 71−00−00−760−020) install the special programming plug used during Testing−09.

POWER PLANT GENERAL − TESTING−21

1. General Comments: All ARINC Labels, OL 031, OL 032, OL 034 And OL 035 Will Be Continuously Sent To The Cool Spike EEC (SMAC−2). A Bill Of Material EEC Does Not Recognize These Labels, They Can Be Permanently Added To The FMC/TMC/FCC/TCC data Stream. The Contents Of These Labels Change Dependent On What Function Is Being Selected/Enabled. Unless Specified Below, It Is Recommended That The Labels Be Sent With A Content Of Hex 0000 For Bits 29 Through 14 When A Given Function Is Not Being Selected/Enabled.
2. LABEL 034/035: "Wake Up" words, OL 034 AND OL 035 Indicate To The SMAC−2 control That It Is Installed On An Engine That Is Mounted In A Test Cell Rather Than On Wing. These Labels Do Not Exist On Either The TCC/TMC/FCC ARINC Data Buss In Any Aircraft. Therefore, These Labels Can Be Continuously Transmitted With Their Content Indicating The Selected/ Enabled State. If The Cool Spike SMAC−2 Does Not Receive The "Wake Up" Words With The Correct Content, The SMAC−2 Will Not Control Any Of It's Outputs And Therefore The Engine Will Not Start.
3. LABEL 031: "The Spiker Arm", When Enabled, Selects A Correct Consistent N2 Idle Speed From Which The Engine Is Accelerated To The 1.5 EPR Power Level For The Spike Test and changes EPR modifier from Class 16 to Class 9 (null). This idle level Is 6000 RPM N2 Corrected To Engine T2. The Requirement For The Test Is That This Idle Level Be Selected/Enabled Prior To The Engine Reaching Idle During The Start. It Is Permitted And Recommended That The "Spiker Arm" Word Be Transmitted With It's Content Indicating Selected/Enabled Prior To Engine Start But It Must Be Sent In This State Before The Engine Reaches Idle. The "Spiker Armed" Label Must Be Set For The "Spiker Initiate" Label To Activate The Fuel Spike Logic. The "Spiker Arm" Label Must Be Deactivated When Tests Other Than Testing−21 Are Being Performed In Order To Return To The Normal Engine Idle Schedule.
4. LABEL 032: "The Spiker Initiate" Word Is Used To Indicate To The SMAC−2 That It Should Activate The Fuel Spike Logic (Results In Fuel Pulse To Engine).
5. Post Test Comments: After The Test Is Completed, It Is Recommended That The SMAC−2 Be Deactivated In The Sequence That Follows:
   (a) Return The "Spiker Armed" Word To The De−selected/ Disarmed State.
   (b) Return The "Spiker Initiate" To The Deselected/Disarmed State.

PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

PW4158, PW4158-3 ENGINE MANUAL, PART NUMBER 50A443

REVISION NO. 85 DATED JANUARY 1, 2008

HIGHLIGHTS - POWER PLANT GENERAL - TESTING

CHAPTER/ SECTION	PAGE NO	DESCRIPTION OF CHANGE	EFFECT OF CHANGE
71-00-00 TESTING-09	1335	Revised the procedure to Check Filters to add a step to look for bronze contamination in the fuel filters. (IEN07KC819)	CONFIG-1 ALL
71-00-00 TESTING-09	1339	Revised the procedure to Check Filters to add a step to look for bronze contamination in the fuel filters. (IEN07KC819)	CONFIG-2 ALL
71-00-00 TESTING-09	1336	Revised the procedure to Check Filters to add a step to look for bronze contamination in the fuel filters. (IEN07KC819)	CONFIG-3 ALL
71-00-00 TESTING-09	1340	Revised the procedure to Check Filters to add a step to look for bronze contamination in the fuel filters. (IEN07KC819)	CONFIG-5 ALL

CHAPTER 71

POWER PLANT GENERAL - TESTING

TABLE OF CONTENTS

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
POWER PLANT GENERAL	71-00-00		
Testing-00		1301	ALL
Task 71-00-00-990-003:			
Test Requirements After Engine/Module/Component Repair or Replacement		1301	
Task 71-00-00-990-005:			
Engine Test Data Names		1306	
Task 71-00-00-990-002:			
Test Instrumentation Calibration		1308	
Task 71-00-00-480-001:			
Prepare The Engine/Power Plant For Test In A Test Cell		1309	
Task 71-00-00-990-004:			
Engine Safety Precautions		1317	
Task 71-00-00-760-002:			
Precautions and Procedures For Safe And Correct Engine Operation		1325	
Task 71-00-00-990-007:			
Engine Operation Limits		1327	
Task 71-00-00-760-003:			
Prime Engine Oil And Fuel System Procedure		1337	
Task 71-00-00-760-004:			
Engine Starting Procedures (Normal)		1351	
Task 71-00-00-760-005:			
Normal Shutdown Procedure		1354	
Task 71-00-00-760-006:			
Emergency Shutdown Procedure		1355	
Task 71-00-00-760-007:			
Start Procedure After An Emergency Shutdown		1356	
Task 71-00-00-760-008:			
Dry Engine Motor Procedure		1357	
Task 71-00-00-760-009:			
Procedure After Engine Surge Or Stall		1358	
Task 71-00-00-760-010:			
Procedure After Engine (EGT) Overtemperature		1360	
Testing-02		1301	ALL
Task 71-00-00-760-029:

POWER PLANT GENERAL - FAN CASE - REMOVAL-01

Task 71-00-33-050-001:

1. Remove Inlet Cowl
   A. Equipment And Materials Required

      Special Tools:
      RSE 1003 Sling, Inlet Cowl
      RSE 1105 Dolly/Work Stand, Inlet Cowl

   B. Procedure
      (1) Tag and remove three electrical connectors from 1 o'clock position on inlet cowl aft bulkhead. Install protective covers over plugs and sockets.
      (2) Remove two hydraulic tubes from 1 o'clock position on inlet cowl aft bulkhead. Install protective cover over ends of both hydraulic tubes and both port fittings.
      (3) Remove electrical connector from 4 o'clock position on inlet cowl aft bulkhead.
      (4) Remove coupling and seal attaching anti-ice duct to anti-ice tube at 4 o'clock position on inlet cowl aft bulkhead. Install protective cover over aft bulkhead anti-ice port.
      (5) Remove four (4) hoist point filler plugs from hoist point (four places) on outside surface of inlet cowl. See Figure 301. Retain plugs for reinstallation.
      (6) Position hoist and RSE 1003 Sling inlet cowl sling over inlet cowl. Using four (4) bolt and four (4) washer details of sling, attach sling pad to inlet cowl hoist point (four places). See Figure 302 for arrangement of sling pads and cables.

      NOTE: Nut details on sling attachment bolts are for tool storage only. Retain nuts for reinstallation to bolt details after removal of sling.

      (7) Raise hoist to remove slack from sling cables. Do not apply hoist load to inlet cowl. Adjust cable turnbuckles to equalize hoist loading on all cables.

      CAUTION: WHEN LAST BOLTS ARE REMOVED FROM MOUNTING RING, SLING LINK MUST BE DIRECTLY OVER INLET COWL CENTER OF GRAVITY. IF NOT, COWL WILL SWING AND STRIKE FAN CASE.

      (8) Remove bolts, washers, and spacers (60 places) attaching inlet cowl mounting ring to fan case flange. Remove bolts in positions 6 and 7 (next to alignment pins) last. See Figure 303.
      (9) With hoist and sling supporting weight of inlet cowl, move cowl away from engine.

(10) Install inlet cowl in RSE 1105 Inlet Cowl Dolly. See Figure 304.
  (a) Ease inlet cowl over dolly. Position inlet cowl so two alignment pins on dolly side mounting plates fit through alignment holes on inlet cowl mounting ring.
  (b) Attach inlet cowl to dolly mounting ring with two bolts, washers and nuts through each dolly mounting plate, 10 places.
(11) Remove four (4) bolts and washers attaching sling pads to hoist points (four places).
(12) Install bolts, washers and nuts in sling pad (four places) for storage.
(13) Install four (4) filler plugs to inlet cowl hoist point (four places).

Task 71-00-33-050-011:

R 1. Remove Fan Cowl Door Hold-Open Rod Without SCU

A. Equipment And Materials Required - None

B. Procedure

(1) Remove fan cowl door hold-open rod, right side. See Figure 301.

(a) Remove two bolts, washers, and nuts attaching hold-open rod mounting bracket to Flange B1. Retain bolts, washers, and nuts with mounting bracket.

(b) Remove two bolts, washers, and nuts attaching hold-open rod retaining bracket to Flange B1. Retain bolts, washers, and nuts with retaining bracket. Retain bracket with hold-open rod.

(2) Remove two hold-open rod braces, right side. See Figure 302.

(a) Remove two bolts, washers, and nuts attaching fan cowl door hold-open rod brace to Flange A1. Retain bolts, washers, and nuts with brace.

(b) Remove two bolts, washers, and nuts attaching thrust reverser sleeve hold-open rod brace to Flange C. Reinstall bolts, washers, and nuts in same holes (Flange C 32,33). Torque nuts 85 - 95 lb-in. (9.604 - 10.734 N.m).

(3) Remove fan cowl door hold-open rod, left side. See Figure 303.

(a) Remove two bolts, washers, and nuts attaching hold-open rod mounting bracket to Flange B2. Retain bolts, washers, and nuts with mounting bracket.

(b) Remove two bolts, washers, and nuts attaching hold-open rod retaining bracket to Flange B1. Retain bolts, washers, and nuts with retaining bracket. Retain bracket with hold-open rod.

(4) Remove two hold-open rod braces, left side. See Figure 304.

(a) Remove two bolts, washers and nuts attaching fan cowl door hold−open rod brace to Flange A1. Retain bolts, washers, and nuts with brace.

(b) Remove two bolts, washers, and nuts attaching thrust reverser sleeve hold−open rod brace to Flange C. Reinstall bolts, washers, and nuts in same holes (Flange C 76,77). Torque nuts 85 − 95 lb−in. (9.604 − 10.734 N.m).

R Task 71−00−33−050−011−A:

R 2. Remove Fan Cowl Door Hold−Open Rod With SCU

R A. Equipment And Materials Required − None

R B. Procedure

R (1) Remove fan cowl door hold−open rod, right side. See Figure 305.

R (a) Remove two bolts, washers, and nuts attaching hold−open rod mounting bracket to Flange B1. Retain bolts, washers, and nuts with mounting bracket.

R (b) Remove two bolts, washers, and nuts attaching hold−open rod retaining bracket to Flange B1. Retain bolts, washers, and nuts with retaining bracket. Retain bracket with hold−open rod.

R (2) Remove two hold−open rod braces, right side. See Figure 306.

R (a) Remove two bolts, washers, and nuts attaching fan cowl door hold−open rod brace to Flange A1. Retain bolts, washers, and nuts with brace.

R (b) Remove two bolts, washers, and nuts attaching thrust reverser sleeve hold−open rod brace to Flange C. Reinstall bolts, washers, and nuts in same holes (Flange C 30,31). Torque nuts 85 − 95 lb−in. (9.604 − 10.734 N.m).

R (3) Remove fan cowl door hold−open rod, left side. See Figure 307.

POWER PLANT GENERAL − FAN CASE − REMOVAL−03

Task 71−00−33−050−002:

1. Removal Fan Case Vibration Accelerometer
   A. Equipment And Materials Required − None
   B. Procedure
      See Figure 301.
      (1) Remove three (3) bolts attaching vibration accelerometer to mounting bracket on fan case, Flange A, at 1 o'clock position. Remove accelerometer and wire harness.

POWER PLANT GENERAL − FAN CASE − REMOVAL−05

Task 71−00−33−050−008:

1. Remove Inlet Cowl Anti−Ice Pressure Switch
   - A. Equipment And Materials Required − None
   - B. Procedure

     See Figure 301.
     - (1) Disconnect pressure sensing tube from anti−ice pressure switch. Install protective cover over tube.
     - (2) Remove electrical connector from inlet cowl anti−ice pressure switch and install protective covers on connector and switch.
     - (3) Remove two bolts, nuts, and washers attaching pressure switch to mounting bracket. Install protective cover on pressure switch port.
     - (4) Remove two (2) bolts, washers and nuts attaching bracket case flange.

Task 71−00−33−050−012:

1. Remove Bifurcation Fire Seal
   - A. Equipment And Materials Required − None
   - B. Procedure

     See Figure 301.
     - (1) Remove bolts, washers, clamps, and nuts attaching oil tank overflow drain tube to anti−ice firewall duct. Retain clamps, bolts, washers, and nuts on duct flange.
     - (2) Remove bolt, washer and nut attaching duct support link to bracket on fan case Flange C at bottom of fan case.
     - (3) Remove two (2) couplings and seals attaching anti−ice firewall duct to anti−ice T−section and to anti−ice aft−lower duct.
     - (4) Remove two (2) bolts, washers and nuts attaching duct support link bracket to fan case Flange C. Reinstall bolts, washers and nuts in same holes to maintain tightness of Flange C union. Torque nuts 85 − 95 lb−in. (9.604 − 10.734 N.m). Retain bracket, support link bolt and nut with support link.
     - (5) Install protective cover over both ends of firewall duct, anti−ice aft−lower duct and anti−ice T−section port.

Task 71-00-33-050-013:

1. Remove Ground Operation Air Transfer Pneumatic Valve
    - A. Equipment And Materials Required - None
    - B. Procedure
      See Figure 301.
        - (1) Remove anti-ice T-section.
            - (a) Remove coupling and seal attaching anti-ice T-section to ground operation air transfer pneumatic valve. Retain coupling with T-section.
            - (b) Install protective cover over anti-ice T-section port.
        - (2) Remove ground operation air transfer pneumatic valve.
            - (a) Remove coupling and seal attaching valve to duct elbow. Retain coupling with valve.
            - (b) Install protective cover over valve ports and over duct elbow end.

POWER PLANT GENERAL − FAN CASE − REMOVAL−09

Task 71−00−33−050−009−001:

1. Remove Thrust Reverser Pressure Regulating And Shutoff Valve − Pre SB PW4NAC 78−46
   A. Equipment And Materials Required − None
   B. Procedure
      See Figures 301 and 302.
      (1) Remove pneumatic lines.
         (a) Disconnect two (2) pneumatic lines from T/R pressure regulating valve. Do not remove nipples and O−rings from valve.
         (b) Disconnect coupling of two pneumatic lines at point near Flange C hole 83. Do not remove unions.
         (c) Remove two (2) bolts, washers and nuts attaching pneumatic line support bracket to Flange C, holes 65,66. Reinstall bolts, washers and nuts in same holes of Flange C to maintain tightness of Flange C union. Torque 85 − 95 lb−in. (9.604 − 10.734 N.m).
         (d) Remove screw and nut attaching two (2) pneumatic line clamps to bracket mounted on PDU support. Retain clamps, screw and nut on pneumatic lines.
         (e) Remove two (2) bolts, washers and nuts attaching support bracket to Flange C, holes 78,79. Reinstall bolts, washer and nuts in same holes of Flange C and torque 85 − 95 lb−in. (9.604 − 10.734 N.m).
         (f) Remove lower section of pneumatic lines.
         (g) Install protective cover over both ends of both pneumatic lines and over two (2) valve ports.
         (h) Remove bolts, washers and nuts attaching four (4) pneumatic line support brackets to Flange C, holes 84,85; 89,90; 95,96; and 101,102. Reinstall bolts, washers and nuts in same holes of Flange C and torque 85 − 95 lb−in. (9.604 − 10.734 N.m).
         (i) Remove upper section of pneumatic lines.
         (j) Install protective cover over ends of both pneumatic lines.
      (2) Remove duct elbow.
         (a) Remove coupling and seal attaching duct elbow to valve. Retain coupling with duct elbow.
         (b) Remove bolts, washers and spacer attaching duct elbow to Flange Bl. Retain bolts, washers and spacer with duct elbow.
         (c) Install protective covers over ends of duct elbow.
      (3) Remove thrust reverser pressure regulating and shutoff valve.
         (a) Disconnect flexible sense line from valve. Do not remove nipple and O−ring from valve.
         (b) Install protective covers over sense line and over valve port.

Figure 302
(Task 71−00−33−050−009−001)

- (c) Remove coupling attaching valve to flexible duct. Retain coupling with valve.
- (d) Remove two (2) bolts, washers and nuts attaching valve support bracket to Flange C holes 61,62. Reinstall bolts, washers and nuts in same holes of Flange C and torque 85 − 95 lb−in. (9.604 − 10.734 N.m).
- (e) Install protective covers over ends of valve and over end of flexible duct.

Task 71−00−33−050−009−002:

2. Remove Thrust Reverser Pressure Regulating And Shutoff Valve − Post SB PW4NAC 78−46
   - A. Equipment And Materials Required − None
   - B. Procedure
     See Figures 301 and 302.
     - (1) Remove pneumatic lines.
       - (a) Disconnect two (2) pneumatic lines from T/R pressure regulating valve. Do not remove nipples and O−rings from valve.
       - (b) Disconnect coupling of two pneumatic lines at point near Flange C hole 83. Do not remove unions.
       - (c) Remove two (2) bolts, washers and nuts attaching pneumatic line support bracket to Flange C, holes 65,66. Reinstall bolts, washers and nuts in same holes of Flange C to maintain tightness of Flange C union. Torque 85 − 95 lb−in. (9.604 − 10.734 N.m).
       - (d) Remove screw and nut attaching two (2) pneumatic line clamps to bracket mounted on PDU support. Retain clamps, screw and nut on pneumatic lines.
       - (e) Remove two (2) bolts, washers and nuts attaching support bracket to Flange C, holes 78,79. Reinstall bolts, washer and nuts in same holes of Flange C and torque 85 − 95 lb−in. (9.604 − 10.734 N.m).
       - (f) Remove lower section of pneumatic lines.
       - (g) Install protective cover over both ends of both pneumatic lines and over two (2) valve ports.
       - (h) Remove bolts, washers and nuts attaching four (4) pneumatic line support brackets to Flange C, holes 84,85; 89,90; 95,96; and 101,102. Reinstall bolts, washers and nuts in same holes of Flange C and torque 85 − 95 lb−in. (9.604 − 10.734 N.m).
       - (i) Remove two (2) screws attaching tube guide to bracket. Remove pneumatic lines and reinstall screws in guide. Torque to 20 − 25 lb−in. (2.258 − 2.823 N.m).
       - (j) Install protective cover over ends of both pneumatic lines.

POWER PLANT GENERAL − FAN CASE − REMOVAL−10

Task 71−00−33−050−005:

1. Remove Thrust Reverser Main Drive Flexible Shaft
   - A. Equipment And Materials Required − None
   - B. Procedure

     See figure 301.
     - (1) Loosen two (2) screws and washers attaching flexible shaft to PDU. Rotate flexible shaft mounting plate until it is free of screws. Tighten screws and washers fingertight and retain with PDU.
     - (2) Remove two (2) bolts, washers and nuts attaching shaft support bracket to Flange B2. Retain bolts, washers and nuts with bracket. Do not remove shaft clamp from bracket.
     - (3) Remove bolt, washer and nut attaching shaft support bracket to Flange C. Reinstall bolt, washer and nut in same hole to maintain tightness of Flange C. Torque nut 85 − 95 lb−in. (9.604 − 10.734 N.m).
     - (4) Remove bolts, washers and nuts attaching three (3) shaft support brackets to Flange C. Reinstall bolts, washers and nuts in same holes of Flange C. Torque nuts 85 − 95 lb−in. (9.604 − 10.734 N.m).
     - (5) Remove bolts, washers and nuts attaching two (2) shaft support brackets to Flange B2. Retain bolts, washers and nuts with bracket.
     - (6) Loosen two (2) screws and washers attaching flexible shaft to splitter gearbox. Rotate flexible shaft mounting plate until it is free of screws. Tighten screws and washers fingertight and retain with splitter gearbox.
     - (7) Remove main drive flexible shaft.
     - (8) Install protective cover over both ends of flexible shaft, over splitter gearbox port and PDU port.

POWER PLANT GENERAL - FAN CASE - REMOVAL-11

Task 71-00-33-050-003:

1. Remove Thrust Reverser Pneumatic Drive Unit (PDU)
    A. Prerequisites
        (1) Remove thrust reverser main drive flexible shaft. See Removal-10, (Task 71-00-33-050-005).
    B. Equipment and Materials Required - None
    C. Procedure
        See Figure 301.
        (1) Remove flexible duct. See Figure 301.
            (a) Remove bolt, washer and nut attaching support link to flexible duct.
            (b) Remove bolts washers and nuts attaching support link bracket to Flange B2. Retain bolts, washers, nuts, bracket and link with flexible duct.
            (c) Remove coupling attaching flexible duct to PDU.
            (d) Remove flexible duct.
            (e) Install protective cover over end of flexible duct and over PDU port.
        (2) Remove pneumatic drive unit (PDU). See Figure 302.
            (a) Disconnect three (3) flexible pneumatic hoses from PDU. Do not remove nipples and O-rings from PDU. Install protective cover over ends of hoses and over PDU ports.
            (b) Remove bolts, washers and nuts attaching PDU to four (4) support brackets. Retain bolts, washers and nuts with PDU.
            (c) Remove PDU.
        (3) Remove PDU support brackets. See Figure 303.
            (a) Remove bolts, washers and nuts attaching two (2) PDU support brackets to fan case Flanges A1 and B1. Retain bolts, washers and nuts with support brackets.
            (b) Remove bolts, washers and nuts attaching two (2) PDU support brackets to fan case Flange B2. Retain bolts, washers and nuts with support brackets.
            (c) Remove bolts, washers and nuts attaching two (2) PDU support brackets to fan case Flange C. Reinstall bolts, washers and nuts in same holes of Flange C (67,68 and 71,72) to maintain tightness of Flange C union. Torque nuts 85 - 95 lb-in. (9.604 - 10.734 N.m).
            (d) Remove support brackets.

Task 71-00-33-050-007:

1. Remove Thrust Reverser Solenoid Operated Selector Valve
   A. Equipment And Materials Required - None
   B. Procedure
      See Figure 301.
      (1) Remove two (2) bolts, washers and nuts attaching flexible hose support bracket to Flange A1. Retain bolts, washers and nuts with bracket.
      (2) Remove four (4) bolts, washers and nuts attaching selector valve mounting bracket to Flanges A1 and B1. Retain bolts, washers and nuts with selector valve.

Task 71−00−33−050−006:

1. Remove Thrust Reverser Splitter Gearbox
   - A. Equipment And Materials Required − None
   - B. Procedure

     See Figure 301.
     - (1) Remove two (2) bolts, washers and nuts attaching splitter gearbox mounting bracket to Flange B2. Retain bolts, washers and nuts with splitter gearbox.
     - (2) Remove two (2) bolts, washers and nuts attaching splitter gearbox mounting bracket to Flange C.
     - (3) Reinstall bolts, washers and nuts in same hole (Flange C holes 108,1). Torque nuts 85 − 95 lb−in. (9.604 − 10.734 N.m).

POWER PLANT GENERAL - FAN CASE - REMOVAL-14

Task 71-00-33-050-014:

1. Remove Fan Case Wire Harness - Pre SB PW4NAC 71-100
   - A. Prerequisites
     - (1) Remove inlet cowl. See Removal-01, (Task 71-00-33-050-001).
   - B. Equipment and Materials Required - None
   - C. Procedure
     - (1) Remove wire harness 21W4118 and 21W4120. See Figure 301 (Sheet 1).
       - (a) Remove screws and nuts attaching harness clamps (1 and 2) to left T/R J-box. Leave harness clamps attached to harness. Retain screws and nuts with clamps.
       - (b) Remove two bolts, washers and nuts attaching harness support bracket (3) to fan case Flange A1. Leave harness clamps attached to harness and to bracket. Retain bolts, washers and nuts with bracket.
       - (c) Remove screw and nut attaching harness clamp (2) to support bracket on Flange B1 above EEC. Reinstall screw and nut in bracket to maintain attachment of other harness clamps.
       - (d) Remove two bolts, washers and nuts attaching harness support bracket (4) to fan case Flange B2. Leave harness clamp attached to bracket. Reinstall bolts, washers and nuts in same holes (104, 105) on fan case Flange B2 to maintain attachment of EEC support and hydraulic tubing support.
       - (e) Remove screw and nut attaching harness clamp (2), on each side of EEC. Retain screw and nut with clamp.
       - (f) Disconnect two electrical connectors D5000P and D5001P from EEC. Install protective covers over connector plugs and receptacles.
       - (g) Disconnect electrical connectors D5020P, D5021P and D5022P from left T/R J-box. Install protective covers over connector plugs and receptacles.
       - (h) Remove harnesses 21W4118 and 21W4120.
     - (2) Remove part of wire harnesses 21W4076, 21W4132 and 21W4150. See Figure 301 (Sheet 2).
       - (a) Disconnect electrical connector D5002P from left T/R J-box. Install protective covers over connector plug and receptacle.
       - (b) Remove two bolts, washers and nuts attaching support bracket (5), with electrical connectors D4986J and D5018J, to fan case Flange B1. Retain bolts, washers and nuts with bracket.

(c) Remove bolts, washers and nuts attaching two support brackets (7) to fan case Flange B1. Retain bolts, washers and nuts with brackets.

(d) Remove screw and nut attaching harness clamps to bracket (7). From clamp (6), remove wire harness (8) that joins wire harness (9). Reattach clamps, including empty clamp (6), screw and nut to bracket (7).

(e) Arrange removed harnesses and brackets near fan case center line to be pulled across fan case from right side.

(3) Remove wire harnesses 21W4076, 21W4132 and 21W4150. See Figure 302 (Sheet 1).

(a) Disconnect electrical connectors D5006P, D5010P and D5007P from right T/R J−box. Install protective cover over connector plugs and receptacles.

(b) Remove screw and nut attaching clamp (11) to support bracket. Retain screw and nut with clamp.

(c) Remove screw and nut attaching harness clamps to support bracket (12). Remove wire harness (8) from clamp (10). Reattach clamps, including empty clamp (10), screws and nuts to bracket (12).

(d) Remove two bolts, washers and nuts attaching bracket (12) to fan case Flange B2. Reinstall bolts, washers and nuts in same holes (11, 12) in fan case Flange B2 to maintain attachment of PMUX support.

(e) Remove two bolts, washers and nuts attaching bracket (13) to fan case Flange B2. Reinstall bolts, washers and nuts in same holes (9,10) in fan case Flange B2 to maintain attachment of PMUX support.

(f) Remove bolts, washers and nuts attaching two support brackets (7) to fan case Flange B1. Retain bolts, washers and nuts with bracket.

(g) Remove screw and nut attaching harness clamps to two brackets (7). Remove wire harness (8) from clamp (6). Reattach clamps, including empty clamp (6), screw and nut to bracket (7).

(h) Remove two bolts, washers and nuts attaching bracket (14), with electrical connectors D5019J, D4987J and D5008J, to fan case Flange B2. Retain bolts, washers and nuts with bracket.

(i) Remove wire harnesses 21W4076, 21W4132 and 21W4150, pulling loosened harnesses, brackets and electrical connectors from left side across top of fan case.

(4) Remove wire harnesses 21W4068, 21W4116 and 21W4140. See Figure 302 (Sheet 2).

    - (a) Remove screw and nut attaching clamp (15) to support bracket (16). Remove vibration accelerometer wire harness from clamp (15). Reattach clamps, including empty clamp (15), screw and nut to support bracket (16). See Figure 302 (Sheet 2), View A.
    - (b) Remove two bolts, washers and nuts attaching bracket (16) to fan case Flange A1. Retain bolts, washers and nuts with bracket.
    - (c) Remove bolts, washers and nuts attaching four brackets (17) to fan case Flange A1. Retain bolts, washers and nuts with bracket.
    - (d) Remove two bolts, washers and nuts attaching bracket (18) to fan case Flange B1. Retain bolts, washers and nuts with bracket.
    - (e) Disconnect electrical connector D5011P from right T/R J−box. Install protective cover over connector plug and receptacle.
    - (f) Remove bolts, washers and nuts attaching three brackets (19) to fan case Flange A1. Retain bolts, washers and nuts with bracket.
    - (g) Remove wire harnesses 21W4068, 21W4116 and 21W4140 from fan case upper−right quarter.
- (5) Harness removal continues on fan case lower−right quarter. See Figure 303.
    - (a) Remove bolts, washers and nuts attaching two brackets (19) to fan case Flange A1. Retain bolts, washers and nuts with bracket.
    - (b) Remove two bolts, washers and nuts attaching bracket (19) to fan case Flange A1. Reinstall bolts, washers and nuts in same holes (37,38) on fan case Flange A1 to maintain attachment of fan cowl door hold−open rod bracket.
    - (c) Remove two bolts, washers and nuts attaching bracket (20) to fan case Flange A1. Retain bolts, washers and nuts with bracket.
    - (d) Remove two bolts, washers and nuts attaching bracket (26) to fan case Flange A1. Retain bolts, washers and nuts with bracket.
    - (e) Remove two bolts, washers and nuts attaching bracket (28) to fan case Flange A1. Reinstall bolts, washers and nuts in same holes (45,46) on fan case Flange A1 to maintain attachment of inlet cowl anti−ice duct support link bracket.
    - (f) Remove two bolts, washers and nuts attaching bracket (18) to fan case Flange B1. Retain bolts, washers and nuts with bracket.

(g) Remove two bolts, washers and nuts attaching bracket (21) to fan case Flange B2. Retain bolts, washers and nuts with bracket.

(h) Remove bolts, washers and nuts attaching two brackets (22) to fan case Flange C. Reinstall bolts, washers and nuts in same holes (40, 41 and 42, 43) to maintain tightness of Flange C union. Torque nuts 85 − 95 lb−in. (9.604 −10.734 N.m).

(i) Remove screw and nut attaching harness clamp (24) to bracket. Retain screw and nut with clamp. See Figure 303, View B.

(j) Remove two bolts, washers and nuts attaching bracket (23) to fan case Flange B2. Retain bolts, washers and nuts with bracket.

(k) Disconnect electrical connector DV220 from anti−ice shutoff and regulating valve. Install protective cover over connector plug and receptacle.

(l) Disconnect electrical connector DS300 from anti−ice pressure switch. Install protective cover over connector plug and receptacle.

(m) Remove bolts, washers and nuts attaching two brackets (25) to fan case Flange C. Reinstall bolts, washers and nuts in same holes (45, 46 and 48, 49) to maintain tightness of Flange C union. Torque nuts 85 − 95 lb−in. (9.604 − 10.734 N.m).

(n) Remove two bolts, washers and nuts attaching bracket (26) to fan case Flange B2. Retain bolts, washers and nuts with bracket.

(o) Remove two bolts, washers and nuts attaching bracket (27) to fan case Flange B1. Retain bolts, washers and nuts with bracket.

(p) Remove two bolts, washers and nuts attaching bracket (28) to fan case Flange A1. Retain bolts, washers and nuts with bracket.

(q) Remove two bolts, washers and nuts attaching bracket (28) to fan case Flange A1. Reinstall one bolt, washer and nut in hole 61 on fan case Flange A1 to maintain attachment of inlet cowl anti−ice support link bracket. Retain other bolt, washer and nut with harness support bracket.

(r) Remove wire harnesses 21W4068, 21W4116 and 21W4140 from fan case lower−right quarter.

(6) Harness removal continues on fan case lower−left quarter. See Figure 304.

(a) Disconnect electrical connector DH9 from T/R regulating and shutoff valve. Install protective cover over connector plug and receptacle.

(b) Remove two bolts, washers and nuts attaching bracket (29) to fan case Flange B1. Retain bolts, washers and nuts with bracket.

(c) Remove two bolts, washers and nuts attaching bracket (28) to fan case Flange A1. Reinstall one bolt, washer and nut in hole 63 on fan case Flange A1 to maintain attachment of inlet cowl anti−ice support link bracket. Retain other bolt, washer and nut with harness support bracket.

(d) Remove bolts, washers and nuts attaching three brackets (28) to fan case Flange A1. Retain bolts, washers and nuts with bracket.

(e) Remove bolts, washers and nuts attaching two brackets (28) to fan case Flange A1. Reinstall three bolts, washers and nuts in holes 78, 79 and 75 on fan case Flange A1 to maintain attachment of PDU support. Retain other bolt, washer and nut with harness support bracket.

(f) Disconnect electrical connector DS304 from PDU. Install protective cover over connector plug and receptacle.

(g) Disconnect electrical connector DH15 from T/R selector valve. Install protective cover over connector plug and receptacle.

(h) Remove two bolts, washers and nuts attaching bracket (30) to fan case Flange A1. Retain bolts, washers and nuts with bracket.

(i) Remove wire harnesses 21W4068, 21W4116 and 21W4140 from fan case lower−right quarter.

POWER PLANT GENERAL − FAN CASE − REMOVAL−14

Task 71−00−33−050−014−A:

2. Remove Fan Case Wire Harness − Post SB PW4NAC 71−100
    - A. Prerequisites
        - (1) Remove inlet cowl. See Removal−01, (Task 71−00−33−050−001).
    - B. Equipment and Materials Required − None
    - C. Procedure
        - (1) Remove wire harness 21W4118 and 21W4120.
            - (a) Disconnect electrical connectors D4998P and D4999P from pylon interface; D5020P, D5021P, and D5022P from left thrust reverser J−box; and D5000P and D5001P from electronic engine control (EEC). Install protective covers. See Figure 305 (Sheets 1 and 2).
            - (b) Remove attaching hardware and clamps (1, 2) attaching harness to brackets, left thrust reverser J−box, and EEC. Retain hardware with clamp.
            - (c) Remove attaching hardware and clamps attaching harnesses to support brackets (3, 4) on Flanges A1 and B2. Retain hardware with clamp.
            - (d) Remove wire harnesses 21W4118 and 21W4120 from fan case.
        - (2) Remove harnesses 21W4075, 21W4076, 21W4132, and 21W4150.
            - (a) Disconnect electrical connector D5002P from left thrust reverser J−box; and D4986J and D5018J from bracket (5). Install protective covers.
            - (b) Remove harnesses, attaching hardware, and clamps from three brackets (6, 7, 8). Retain hardware with clamp.
            - (c) Arrange previously removed harnesses and brackets near fan case centerline to be pulled across fan case from right side.
            - (d) Disconnect electrical connectors D5006P, D5010P, D5051P and D5007P from right thrust reverser J−box; D5019J, D4987J, and D5008J, from bracket (9); and D4989P, D4953P, and D4966P from pylon interface. Install protective covers. See Figure 306.
            - (e) Remove attaching hardware and clamps attaching harnesses to fan case.
            - (f) Remove wire harnesses 21W4076, 21W4132, and 21W4150 from fan case.
        - (3) Remove wire harnesses 21W4068, 21W4116, and 21W4140.
            - (a) Disconnect electrical connectors D4970P, D4963P, and D4967P from pylon interface; D4965P from inlet cowl, DT588 from vibration accelerometer, and D5011P and D5053P from right thrust reverser J−box. Install protective covers. See Figure 306.

(b) Remove harnesses, attaching hardware, and clamps from brackets (10 through 20). Retain hardware with clamps.

(c) Remove wire harness 21W4068, 21W4116, and 21W4140 from fan case upper−right quarter.

(d) Disconnect electrical connector DV220 from anti−ice shutoff and regulating valve, DS300 from anti−ice pressure switch, and D4969P from inlet cowl. Install protective covers. See Figure 307.

(e) Disconnect grounding wire from stud. Retain attaching hardware for reinstallation.

(f) Remove harnesses attaching hardware and clamps from brackets (21 through 31).

(4) Remove wire harnesses 21W4068, 21W4116 and 21W4140 from fan case lower−right quarter.

(a) Disconnect electrical connector DH15 from thrust reverser selector valve, DS304 from pneumatic drive unit (PDU), and DH9 from thrust reverser regulating and shutoff valve. Install protective covers. See Figure 308.

(b) Remove hardware and clamps attaching harnesses to brackets (31, 32, 33). Retain hardware with clamps.

(c) Remove wire harnesses 21W4068, 21W4116, and 21W4140 from fan case.

(5) Remove wire harness 21W4083.

(a) Disconnect electrical connector D5052P from right thrust reverser J−box. Install protective cover. See Figure 306.

(b) Disconnect electrical connector DS308 from bracket−mounted barometric switch. Install protective cover.

(c) Remove wire harness 21W4083 from fan case.

POWER PLANT GENERAL - FAN CASE - REMOVAL-15

Task 71-00-33-050-019:

1. Remove EEC Inlet Pressure/Temperature (PT2/TT2) Probe
   - A. Equipment And Materials Required - None
   - B. Procedure

     See Figure 301.
     - (1) Gain access to probe by removing 12 bolts and access cover on upper right side of inlet cowl.
     - (2) Disconnect electrical connectors DH11A and DH11B. Install protective covers on connectors and receptacles.
     - (3) Remove pneumatic pressure line from probe and install protective covers on line and probe fitting.
     - (4) Remove six bolts and washers attaching probe to inner cowl barrel mounting bracket and remove probe.

Task 71–00–33–050–020:

1. Remove Maintenance Interphone Jack
   - A. Equipment and Materials Required – None
   - B. Procedure

     See Figure 301.
     - (1) Loosen four inner screws (301/2) attaching maintenance interphone assembly to cover (301/3).
     - (2) Remove six screws (301/1) attaching cover to inlet cowl.
     - (3) Draw jack assembly, cover and wires out of inlet cowl.
     - (4) Remove screws (301/2), retainer (301/12) and cover from jack assembly.
     - (5) Remove nut (301/17), lockwasher (301/4), washer (301/16) and mounting plate (301/5) from jack. Discard lockwasher.
     - (6) Unscrew coupling nut (301/15) holding gland (301/14) and pressure plates (301/13) in place and pull maintenance interphone jack (301/6) out of shell, exposing electrical connections.
     - (7) Remove screws (301/7), washers (301/8), lockwashers (301/9) and nuts (301/10) attaching wire to maintenance interphone jack. Remove jack.

POWER PLANT GENERAL - FAN CASE - REMOVAL-17

Task 71-00-33-050-021:

1. Inlet Cowl Anti-Ice Shutoff And Regulating Valve Removal
   - A. Equipment and Materials Required - None
   - B. Procedure
     - (1) Remove anti-ice valve sensing tube. See Figure 301.
       - (a) Remove two (2) bolts, washers and nuts attaching TAI valve locator bracket to fan case Flange B1 at holes 48 and 49.
       - (b) Disconnect pressure sensing tube from anti-ice shutoff and regulating valve. Do not remove tube union from valve.
       - (c) Install protective covers over sensing tube and valve port.
     - (2) Remove anti-ice shutoff and regulating valve. See Figure 302.
       - (a) Remove coupling and seal securing valve to anti-ice valve inlet duct.
       - (b) Remove coupling securing valve to anti-ice outlet duct.
       - (c) Install protective covers over both valve ports.
       - (d) Install protective covers over valve inlet and outlet duct open ends.

POWER PLANT GENERAL - FAN CASE - REMOVAL-18

Task 71-00-33-050-022:

1. Remove Inlet Cowl Anti-Ice System Ducts
    - A. Prerequisites
        - (1) Remove inlet cowl anti-ice shutoff and regulating valve. See Removal-17 (Task 71-00-33-050-021).
    - B. Equipment and Materials Required - None
    - C. Procedure
        - (1) Remove anti-ice valve inlet duct. See Figures 301 and 302.
            - (a) Remove coupling and seal attaching duct to anti-ice duct T-section.
            - (b) Remove bolts, washers and nuts attaching five (5) duct support links to support link brackets on fan case flanges. Temporarily replace bolts, washers and nuts in support links.
            - (c) Remove bolts, washers and nuts attaching five (5) support link brackets to fan case flanges. Temporarily replace bolts, washers and nuts in support link brackets.
            - (d) Install protective covers over both ends of duct and over anti-ice duct T-section port.
        - (2) Remove anti-ice valve outlet duct. See Figures 303 and 304.
            - (a) Remove bolts, washers and nuts attaching two (2) support links to support link brackets on fan case flanges. Temporarily replace bolts, washers and nuts in support link brackets.
            - (b) Remove bolts, washers and nuts attaching two (2) support link brackets to fan case flanges. Temporarily replace bolts, washers and nuts in support link brackets.
            - (c) Install protective covers over both ends of duct.

Task 71−00−33−050−029:

1. Remove Nacelle Cooling Tube Assemblies

   A. Equipment and Materials Required − None

   B. Procedure

      (1) Remove nacelle cooling tube assemblies (Post SB PW4NAC 78−40. See Figure 301.

         (a) Disconnect nut, washer, and union from top end of upper nacelle cooling tube assembly (1) at bracket.

         (b) Disconnect lower coupling of upper tube assembly from tee at Flange C bracket.

         (c) Remove screw, washer, and clamp attaching upper tube assembly to adjacent pneumatic tube at splitter gearbox bracket.

         (d) Disconnect top of center tube assembly (2) from tee fitting and lower end of tube from union at top of lower tube assembly (3).

         (e) Remove screws, washers, and clamps attaching center tube assembly to two brackets on Flange B2 and one bracket on Flange C.

         (f) Disconnect lower tube assembly from reducer and remove screws, washers, and clamps attaching tube assembly to three brackets on Flange C of the fan case.

POWER PLANT GENERAL - FAN CASE - REMOVAL-20

Task 71-00-33-050-033:

1. Remove Heat Diffuser Assembly - Post SB PW4NAC 78-21 And Pre SB PW4NAC 78-40

   A. Equipment and Materials Required - None

   B. Procedure

   See Figures 301 and 302.

   (1) On left side of fan case, disconnect tube assembly from tee fitting and tee duct assembly.

   (2) Remove bolts, washers, and nuts attaching diffuser assembly to Flange B2.

   (3) Disconnect diffuser assembly from union in upper tube assembly.

   (4) Remove union from upper tube assembly.

   (5) Disconnect lower end of tube assembly from tee fitting at mounting bracket.

   (6) Remove clamps, bolts, nuts, and washers attaching tube assemblies and to Flange B2.

   (7) Remove union from tube assemblies.

   (8) Remove tube assemblies from beneath pneumatic drive unit (PDU).

   (9) On right side of fan case, disconnect lower tube assembly from tee fitting.

   (10) Remove bolts, washers, and nuts attaching diffuser assembly from Flange B2.

   (11) Disconnect diffuser assembly from union.

   (12) Remove union from upper tube assembly.

   (13) Remove clamps, screws, washers, and nuts attaching tube assemblies to Flange B2.

   (14) Disconnect upper tube assembly from union.

   (15) Remove union from lower tube assembly.

(16) Remove tube assemblies.

Task 71−00−33−050−033−A:

2. Remove Heat Diffuser Assembly − Post SB PW4NAC 78−21 And PW4NAC 78−40

A. Equipment and Materials Required − None

B. Procedure

See Figures 301 and 303.

(1) On left side of fan case, disconnect tube assembly from tee fitting and tee duct assembly.

(2) Remove bolts, washers, and nuts attaching diffuser assembly to Flange B2.

(3) Disconnect diffuser assembly from union in upper tube assembly.

(4) Remove union from upper tube assembly.

(5) Disconnect lower end of tube assembly from tee fitting at mounting bracket.

(6) Remove clamps, bolts, nuts, and washers attaching tube assemblies and to Flange B2.

(7) Remove union from tube assemblies.

(8) Remove tube assemblies from beneath pneumatic drive unit (PDU).

(9) On right side of fan case, disconnect coupling of pneumatic supply tube assembly at tee fitting.

(10) Disconnect lower tube assembly from tee fitting.

(11) Remove bolts, washers, and nuts attaching diffuser assembly from Flange B2.

(12) Disconnect diffuser assembly from union.

(13) Remove union from upper tube assembly.

(14) Loosen upper tube assembly coupling at tee.

(15) Remove clamp, screw, washer, and nut attaching upper tube assembly to Flange B2.

(16) Remove upper tube assembly.

(17) Loosen top coupling of center tube assembly at tee fitting.

(18) Remove clamps, screws, washers and nuts attaching tube assemblies and to Flange B2.

(19) Disconnect center tube assembly from union.

(20) Remove union from lower tube assembly.

(21) Remove tube assemblies.

Task 71-00-33-050-035:

1. Remove EEC And RVDT Electrical Junction Box - Right Hand Side

A. Equipment and Materials Required

Standard Tools:

Name	Manufacturer
Wrench, Strap (Glenair TG-70)	Glenair International Corp 312 5th Ave. New Rochelle, NY 10802
Pliers, Soft-Jawed (optional) (Glenair TG-69)	Glenair International Corp 312 5th Ave. New Rochelle, NY 10802

B. Procedure

See Figure 301.

(1) Remove lockwire and disconnect electrical connectors D5011P, D5052P, D5053P, D5007P, D5010P, D5006P and D5051P from the EEC J-Box (5) on the brackets on the fan case. Install protective covers on the connectors.

(2) (Pre SB PW4NAC 71-100) Remove the screws (10), washers (15) and nuts (20) that attach the EEC J-Box (5) to the brackets on the fan case.

(3) (Post SB PW4NAC 71-100) Remove the screws (10) and washers (15) that attach the EEC J-Box to the brackets on the fan case.

(4) Remove the J-Box (5).

POWER PLANT GENERAL - FAN CASE - REMOVAL-23

Task 71-00-33-050-036:

1. Removal of EEC J-Box - Left Hand Side

A. Equipment and Materials Required

Standard Tools:

Name	Manufacturer
Wrench, Strap (Glenair TG-70)	Glenair International Corp 312 5th Ave. New Rochelle, NY 10802
Pliers, Soft-Jawed (optional) (Glenair TG-69)	Glenair International Corp 312 5th Ave. New Rochelle, NY 10802

B. Procedure

See Figure 301.

(1) Remove lockwire and disconnect electrical connectors D5003P, D5021P, D5020P, D5002P, D5022P, W1P30P and W2P30P connectors from the EEC J-Box (5) located on the left side of the fan case. Install protective covers on the connectors.

(2) Remove the screws (10), washers (15) and clamps (20) that attach the wire harnesses to the aft side of the EEC J-Box (5).

(3) (Pre SB PW4NAC 71-100) Remove the screws (25), washers (30) and nuts (35) that attach the EEC J-Box (5) to the brackets on the fan case.

(4) (Post SB PW4NAC 71-100) Remove the screws (25) and washers (30) that attach the EEC J-Box (5) to the brackets on the fan case.

(5) Remove the EEC J-Box (5).

POWER PLANT GENERAL - FAN CASE - REMOVAL-24

Task 71-00-33-050-037:

1. Remove PS And P2 System Tubing

A. Equipment and Materials Required - None

B. Procedure

See Figure 301.

(1) Disconnect coupling nuts on PS tube (301/2) and P2 tube (301/1) assemblies at fittings.

(2) Remove clamps, washer, screw, and nut securing tube assemblies to bracket on forward face of Flange A1.

(3) Remove tube assemblies from engine case.

POWER PLANT GENERAL - FAN CASE - INSTALLATION-01

Task 71-00-33-450-001:

1. Install Inlet Cowl

A. Equipment And Materials Required

Special Tools:
RSE1003 PW Sling, Inlet Cowl
RSE1105 PW Dolly/Work Stand, Inlet Cowl

Consumable Materials:

Item No.	Designation
P06-013	Solid Film Lubricant

B. Procedure

(1) Remove four (4) hoist point filler plugs from hoist points on outside surface of inlet cowl. Retain plugs for re-installation. See Figure 401.

(2) Position hoist and RSE 1003 Inlet Cowl Sling over inlet cowl and, using four (4) bolt and four (4) washer details, attach sling pad to inlet cowl hoist points. See Figure 402 for arrangement of sling pads and cables.

NOTE: Nut on sling pad bolt retains bolt and washer in sling pad while sling is not in use. When sling is in use, save nut for re-installation in sling pad.

(3) Raise and position hoist just enough to remove slack from sling cables but not enough to cause strain to inlet cowl. Place even tension on all cables of sling so cowl will not swing when removed from dolly.

CAUTION: WHEN LAST BOLTS ARE REMOVED FROM DOLLY MOUNTING RING, SLING LINK MUST BE DIRECTLY OVER INLET COWL CENTER OF GRAVITY. IF NOT, COWL WILL SWING AND STRIKE DOLLY.

(4) Remove bolts, washers and nuts attaching inlet cowl mounting ring to dolly mounting plates. Remove two bolts next to two (2) alignment pins on side dolly mounting plates last. See Figure 403.

(5) With hoist and sling supporting weight of inlet cowl, move cowl away from dolly.

(6) Position inlet cowl so two alignment pins on fan case flange fit through alignment holes on inlet cowl mounting ring. See Figure 404.

Figure 404
(Task 71–00–33–450–001)

POWER PLANT GENERAL − FAN CASE − INSTALLATION−01

CAUTION: DO NOT LUBRICATE MOUNTING BOLTS.

(7) Attach inlet cowl to fan case mounting flange with sixty (60) bolts, washers and spacers. Snug bolts but do not torque at this time. See Figure 404.

(8) When all 60 bolts are installed, follow sequence of numbered bolts in Figure 404 and torque all attaching bolts 310 − 330 lb−in. (35.025 − 37.285 N.m). After all bolts have been torqued in sequence, retorque all 60 bolts in sequence a second time.

(9) Remove four (4) bolts and washers attaching sling pads to hoist points. See Figure 402.

(10) Retain four (4) bolts, washers and nuts in sling pads of RSE 1003 Sling kit.

(11) Install four (4) filler plugs to inlet cowl hoist points. See Figure 401.

(12) Lubricate inside surface of duct coupling with Material P06−013.

(13) Using Coupling, attach anti−ice duct to anti−ice tube at 4 o'clock position on inlet cowl aft bulkhead. Torque coupling to the value marked on coupling. See Figure 401.

(14) Connect electrical connector to receptacle at 4 o'clock position on inlet cowl aft bulkhead. Tighten connector fingertight plus one−eighth turn.

(15) Connect two (2) hydraulic tubes to inlet cowl aft bulkhead, at 1 o'clock position. Torque tube connections 180 − 200 lb−in. (20.337 − 22.597 N.m).

(16) Connect three electrical connectors to inlet cowl aft bulkhead at 1 o'clock position. Tighten connectors fingertight plus one−eighth turn.

Task 71−00−33−450−011:

R 1. Install Fan Cowl Door Hold−Open Rod Without SCU

A. Equipment and Materials Required − None

B. Procedure

(1) Install fan cowl door hold−open rod, right side. See Figure 401.

(a) Position hold−open rod mounting bracket over Flange B1 holes 36,37.

(b) Install two bolts, washers, and nuts, attaching hold−open rod mounting bracket to Flange B1. Torque nuts 93 − 107 lb−in. (10.508 − 12.089 N.m).

(c) Position hold−open rod retaining bracket over Flange B1 holes 30,31.

(d) Install two bolts, washers, and nuts attaching hold−open rod retaining bracket to Flange B1. Torque nuts 93 − 107 lb−in. (10.508 − 12.089 N.m).

(2) Install two hold−open rod braces, right side. See Figure 402.

(a) Position fan cowl door hold−open rod brace over Flange A1 holes 37,38.

(b) Install two bolts, washers, and nuts attaching fan cowl door hold−open rod brace to Flange A1. Torque nuts 93 − 107 lb−in. (10.508 − 12.089 N.m).

(c) Remove existing bolts, washers, and nuts from Flange C holes 32,33.

(d) Position thrust reverser sleeve hold−open rod brace over Flange C holes 32,33.

(e) Install two bolts, washers, and nuts attaching thrust reverser sleeve hold−open rod brace to Flange C. Torque nuts 93 − 107 lb−in. (10.508 − 12.089 N.m).

(3) Install fan cowl door hold−open rod, left side. See Figure 403.

  (a) Position hold−open rod mounting bracket over Flange B2 holes 84,85.

  (b) Install two bolts, washers, and nuts attaching hold−open rod mounting bracket to Flange B2. Torque nuts 93 − 107 lb−in. (10.508 − 12.089 N.m).

  (c) Position hold−open rod retaining bracket over Flange B1 holes 90,91.

  (d) Install two bolts, washers, and nuts attaching hold−open rod retaining bracket to Flange B1. Torque nuts 93 − 107 lb−in. (10.508 − 12.089 N.m).

(4) Install two hold−open rod braces, left side. See Figure 404.

  (a) Position fan cowl door hold−open rod brace over Flange A1 holes 83,84.

  (b) Install two bolts, washers, and nuts attaching fan cowl door hold−open rod brace to Flange A1. Torque nuts 93 − 107 lb−in. (10.508 − 12.089 N.m).

  (c) Remove existing bolts, washers and nuts from Flange C holes 76,77.

  (d) Position thrust reverser sleeve hold−open rod brace over Flange C holes 76,77.

  (e) Install two bolts, washers, and nuts attaching thrust reverser sleeve hold−open rod brace to Flange C. Torque nuts 93 − 107 lb−in. (10.508 − 12.089 N.m).

R Task 71−00−33−450−011−A:

R 2. Install Fan Cowl Door Hold−Open Rod With SCU

R A. Equipment and Materials Required − None

R B. Procedure

R (1) Install fan cowl door hold−open rod, right side. See Figure 405.

R (a) Position hold−open rod mounting bracket over Flange B1 holes 37,38.

R (b) Install two bolts, washers, and nuts, attaching hold−open rod mounting bracket to Flange B1. Torque nuts 93 − 107 lb−in. (10.508 − 12.089 N.m).

R (c) Position hold−open rod retaining bracket over Flange B1 holes 30,31.

R (d) Install two bolts, washers, and nuts attaching hold−open rod retaining bracket to Flange B1. Torque nuts 93 − 107 lb−in. (10.508 − 12.089 N.m).

R (2) Install two hold−open rod braces, right side. See Figure 406.

R (a) Position fan cowl door hold−open rod brace over Flange A1 holes 38,39.

R (b) Install two bolts, washers, and nuts attaching fan cowl door hold−open rod brace to Flange A1. Torque nuts 93 − 107 lb−in. (10.508 − 12.089 N.m).

R (c) Remove existing bolts, washers, and nuts from Flange C holes 32,33.

R (d) Position thrust reverser sleeve hold−open rod brace over Flange C holes 32,33.

R (e) Install two bolts, washers, and nuts attaching thrust reverser sleeve hold−open rod brace to Flange C. Torque nuts 93 − 107 lb−in. (10.508 − 12.089 N.m).

(3) Install fan cowl door hold−open rod, left side. See Figure 407.

- (a) Position hold−open rod mounting bracket over Flange B2 holes 82,83.
- (b) Install two bolts, washers, and nuts attaching hold−open rod mounting bracket to Flange B2. Torque nuts 93 − 107 lb−in. (10.508 − 12.089 N.m).
- (c) Position hold−open rod retaining bracket over Flange B1 holes 89,90.
- (d) Install two bolts, washers, and nuts attaching hold−open rod retaining bracket to Flange B1. Torque nuts 93 − 107 lb−in. (10.508 − 12.089 N.m).

(4) Install two hold−open rod braces, left side. See Figure 408.

- (a) Position fan cowl door hold−open rod brace over Flange A1 holes 81,82.
- (b) Install two bolts, washers, and nuts attaching fan cowl door hold−open rod brace to Flange A1. Torque nuts 93 − 107 lb−in. (10.508 − 12.089 N.m).
- (c) Remove existing bolts, washers and nuts from Flange C holes 76,77.
- (d) Position thrust reverser sleeve hold−open rod brace over Flange C holes 76,77.
- (e) Install two bolts, washers, and nuts attaching thrust reverser sleeve hold−open rod brace to Flange C. Torque nuts 93 − 107 lb−in. (10.508 − 12.089 N.m).

POWER PLANT GENERAL - FAN CASE - INSTALLATION-03

Task 71-00-33-450-002:

1. Install Fan Case Vibration Accelerometer
   A. Equipment And Materials Required

      Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
MS20995N20				
Lockwire, As Required				

   B. Procedure
      See Figure 401.
      (1) Position vibration accelerometer on bracket mounted on fan case Flange A at 1 o'clock position. Attach accelerometer with three (3) bolts. Torque bolts 12 - 15 lb-in. (1.356 - 1.695 N.m). Lockwire bolts.

POWER PLANT GENERAL − FAN CASE − INSTALLATION−04

Task 71−00−33−450−004:

1. Install Inlet Cowl Anti−Ice Visual Overpressure Indicator

NOTE: This procedure has been deleted.

POWER PLANT GENERAL - FAN CASE - INSTALLATION-05

Task 71-00-33-450-008:

1. Install Inlet Cowl Anti-Ice Pressure Switch
   - A. Equipment And Materials Required - None
   - B. Procedure

     See Figure 401.
     - (1) Position inlet cowl mounting bracket on fan case Flange B2 over holes 45 and 46. Attach bracket with two bolts, washers and nuts. Torque nuts 93 - 107 lb-in. (10.508 - 12.089 N.m).
     - (2) Install inlet cowl anti-ice pressure switch in the mounting bracket with washer and nut. Torque nut to 120 - 130 lb-in. (13.6 - 13.7 N.m).
     - (3) Remove protective covers from electrical connector and pressure switch and connect connector. Tighten fingertight, plus one-eighth turn.
     - (4) Connect pressure sensing tube to pressure switch. Torque tube connection 180 - 200 lb-in. (20.337 - 24.857 N.m).

POWER PLANT GENERAL - FAN CASE - INSTALLATION-06

Task 71-00-33-450-010:

1. Install Inlet Cowl Anti-Ice Shutoff And Regulating Valve - Deleted

NOTE: This Procedure Has Been Deleted

POWER PLANT GENERAL - FAN CASE - INSTALLATION-07

Task 71-00-33-450-012:

1. Install Bifurcation Fire Seal

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P06-013	Solid Film Lubricant

B. Procedure

See Figure 401.

(1) Remove protective covers from both ends of firewall duct, end of anti-ice aft-lower duct and anti-ice T-section port.

(2) Remove existing bolts and nuts from fan case Flange C holes 54 and 55.

(3) Position duct support link bracket over forward side of fan case Flange C, holes 54 and 55, with link attachment toward hole 55. Install bolts, washers and nuts attaching support bracket to Flange C. Torque nuts 85 - 95 lb-in. (9.604 - 10.734 N.m).

(4) Check and, if necessary, set support link to nominal length (1.75 inch (44.45 mm), center of rod ends). Torque locking nuts 100 - 140 lb-in. (11.298 - 15.818 N.m).

(5) Lubricate inside surface of duct coupling with Material (P06-013).

(6) Position duct against anti-ice aft-lower duct. Place coupling seal between mating flanges.

(7) Verify that outside diameters of mating flanges are aligned radially within 0.06 inch (1.524 mm), and angular gap between mating faces of flanges is not greater than 0.04 inch (1.016 mm).

(8) Install coupling to attach duct to anti-ice aft-lower duct. Tighten coupling fingertight.

(9) Lubricate inside surface of duct coupling with Material (P06-013).

(10) Position duct against anti-ice T-section. Place coupling seal between mating flanges.

(11) Verify that outside diameters of mating flanges are aligned radially within 0.06 inch (1.524 mm) and angular gap between mating faces of flanges is not greater than 0.04 inch (1.016 mm).

(12) Install coupling to attach duct to anti-ice T-section. Tighten coupling fingertight.

(13) Install bolt, washer and nut attaching duct support link to support link bracket on fan case Flange C. Torque nut 50 - 70 lb-in. (5.649 - 7.909 N.m).

Task 71−00−33−450−013:

1. Install Ground Operation Air Transfer Pneumatic Valve
   A. Equipment And Materials Required

      Consumable Materials:

Item No.	Designation
P06−013	Lubricant

   B. Procedure
      See Figure 401.
      (1) Install Ground Operation Air Transfer Pneumatic Valve. See Figure 401.
         (a) Remove protective covers from both valve ports and from duct elbow.
         (b) Lubricate inside surface of duct coupling with Material P06−013.
         (c) Position valve against duct elbow. Rotate valve until key on valve flange fits key slot on duct elbow. Place seal between mating flanges.
         (d) Verify that outside diameters of mating flanges are aligned radially within 0.06 inch (1.524 mm), and angular gap between mating faces of flanges is not greater than 0.04 inch (1.016 mm).
         (e) Install coupling to attach valve to duct elbow. Tighten coupling fingertight.
      (2) Install Anti−Ice Duct T−section.
         (a) Remove protective cover from anti−ice duct T−section.
         (b) Lubricate inside surface of duct coupling with Material P06−013.
         (c) Position T−section against valve. Place seal between mating flanges.
         (d) Verify that outside diameters of mating flanges are aligned radially within 0.06 inch (1.524 mm), and angular gap between mating faces of flanges is not greater than 0.04 inch (1.016 mm).
         (e) Install coupling to attach T−section to valve. Tighten coupling fingertight.
         (f) Torque two couplings to value indicated on each coupling. Tap around couplings with plastic mallet. Retorque couplings.

POWER PLANT GENERAL - FAN CASE - INSTALLATION-09

Task 71-00-33-450-009-001:

1. Install Thrust Reverser Pressure Regulating And Shutoff Valve - Pre SB PW4NAC 78-46
   A. Equipment And Materials Required - None
   B. Procedure
      See Figures 401 and 402.
      (1) Install duct elbow.
         (a) Position duct elbow between Flanges B1 and B2 with straight end pointing down and with mounting frame over holes 65,66,67.
         (b) Place spacer between mounting frame and Flange B1 and install three (3) bolts and washers attaching mounting frame to flange. Tighten bolts fingertight.
         (c) Place spacer between mounting frame and Flange B2 and install three (3) bolts and washers attaching mounting frame to flange. Tighten bolts fingertight.
      (2) Install thrust reverser pressure regulating and shutoff valve.
         (a) Remove protective covers from both ends of valve, end of flexible duct, upper end of duct elbow, end of flexible sense line (from flexible duct) and valve port for sense line.
         (b) Remove existing bolts, washers and nuts from Flange C holes 61,62.
         (c) Observe direction of arrow on valve. Point arrow toward flexible duct.
         (d) Position valve against duct elbow. Place seal between mating flanges.
         (e) Verify that outside diameters of mating flanges are aligned radially within 0.06 inch (1.524 mm), and angular gap between mating faces of flanges is not greater than 0.04 inch (1.016 mm).
         (f) Install coupling to attach valve to duct elbow. Tighten coupling fingertight.
         (g) Adjust valve position so support (clocking) bracket fits against Flange C over holes 61,62.
         (h) Install bolts, washers and nuts attaching valve bracket to Flange C. Tighten nuts fingertight.
         (i) Position valve against flexible duct.
         (j) Verify that outside diameters of mating flanges are aligned radially within 0.06 inch (1.524 mm), and angular gap between mating faces of flanges is not greater than 0.04 inch (1.016 mm).
         (k) Install coupling to attach valve to flexible duct. tighten coupling fingertight.
         (l) Connect flexible sense line to receptacle on valve and torque 270 - 300 lb-in. (30.506 - 33.895 N.m).

Thrust Reverser Regulating Valve Pneumatic Lines
Figure 402
(Task 71−00−33−450−009−001)

(m) Torque two nuts attaching valve support bracket to Flange C 85 − 95 lb−in. (9.604 − 10.734 N.m).
(n) Torque two couplings to value indicated on each coupling. Tap around coupling with plastic mallet. Retorque coupling.
(o) Torque three (3) bolts attaching duct elbow to Flange B1, and three (3) bolts attaching duct elbow to Flange B2 each 85 − 95 lb−in. (9.604 − 10.734 N.m).

(3) Install pneumatic lines.
(a) Remove protective covers from lower ends of upper section of pneumatic lines.
(b) Remove existing bolts, washers and nuts from Flange C holes 101,102.
(c) Lay upper pneumatic line section along Flange C with the upper support bracket over holes 101,102.
(d) Install bolts, washers and nuts attaching pneumatic line support bracket to Flange C holes 101,102. Torque 85 − 95 lb−in. (9.604 − 10.734 N.m).
(e) Remove existing bolts, washers and nuts from Flange C holes 95,96. Install bolts, washers and nuts attaching pneumatic line support bracket to Flange C holes 95,96. Torque 85 − 95 lb−in. (9.604 − 10.734 N.m).
(f) Remove existing bolts, washers and nuts from Flange C holes 89,90. Install bolts, washers and nuts attaching pneumatic line support bracket to Flange C holes 89,90. Torque 85 − 95 lb−in. (9.604 − 10.734 N.m).
(g) Remove existing bolts, washers and nuts from Flange C holes 84,85. Install bolts, washers and nuts attaching pneumatic line support bracket to Flange C holes 84,85. Torque 85 − 95 lb−in. (9.604 − 10.734 N.m).
(h) Remove protective covers from both ends of lower pneumatic line section and from pneumatic line receptacles on valve.
(i) Connect both lines of the lower section to upper section. Torque couplings 270 − 300 lb−in. (30.506 − 33.895 N.m).
(j) Remove existing bolts, washers and nuts from Flange C holes 78,79. Install bolts, washers and nuts attaching pneumatic line support bracket to Flange C holes 78,79. Torque 85 − 95 lb−in. (9.604 − 10.734 N.m).
(k) Install screw and nut attaching two (2) pneumatic line clamps, with pneumatic lines, to support bracket mounted on PDU support.

(l) Remove existing bolts, washers and nuts from Flange C holes 65,66. Install bolts, washers and nuts attaching pneumatic line support bracket to Flange C holes 65,66. Torque 85 − 95 lb−in. (9.604 − 10.734 N.m).

(m) Connect both pneumatic lines to respective receptacle on regulating and shutoff valve. Torque couplings 270 − 300 lb−in. (30.506 − 33.895 N.m).

Task 71−00−33−450−009−002:

2. Install Thrust Reverser Pressure Regulating And Shutoff Valve − Post SB PW4NAC 78−46
   - A. Equipment And Materials Required − None
   - B. Procedure

     See Figures 401 and 402.
     - (1) Install duct elbow.
       - (a) Position duct elbow between Flanges B1 and B2 with straight end pointing down and with mounting frame over holes 65,66,67.
       - (b) Place spacer between mounting frame and Flange B1 and install three (3) bolts and washers attaching mounting frame to flange. Tighten bolts fingertight.
       - (c) Place spacer between mounting frame and Flange B2 and install three (3) bolts and washers attaching mounting frame to flange. Tighten bolts fingertight.
     - (2) Install thrust reverser pressure regulating and shutoff valve.
       - (a) Remove protective covers from both ends of valve, end of flexible duct, upper end of duct elbow, end of flexible sense line (from flexible duct) and valve port for sense line.
       - (b) Remove existing bolts, washers and nuts from Flange C holes 61,62.
       - (c) Observe direction of arrow on valve. Point arrow toward flexible duct.
       - (d) Position valve against duct elbow. Place seal between mating flanges.
       - (e) Verify that outside diameters of mating flanges are aligned radially within 0.06 inch (1.524 mm), and angular gap between mating faces of flanges is not greater than 0.04 inch (1.016 mm).
       - (f) Install coupling to attach valve to duct elbow. Tighten coupling fingertight.
       - (g) Adjust valve position so support (clocking) bracket fits against Flange C over holes 61,62.

(h) Install bolts, washers and nuts attaching valve bracket to Flange C. Tighten nuts fingertight.
(i) Position valve against flexible duct.
(j) Verify that outside diameters of mating flanges are aligned radially within 0.06 inch (1.524 mm), and angular gap between mating faces of flanges is not greater than 0.04 inch (1.016 mm).
(k) Install coupling to attach valve to flexible duct. tighten coupling fingertight.
(l) Connect flexible sense line to receptacle on valve and torque 270 − 300 lb−in. (30.506 − 33.895 N.m).
(m) Torque two nuts attaching valve support bracket to Flange C 85 − 95 lb−in. (9.604 − 10.734 N.m).
(n) Torque two couplings to value indicated on each coupling. Tap around coupling with plastic mallet. Retorque coupling.
(o) Torque three (3) bolts attaching duct elbow to Flange B1, and three (3) bolts attaching duct elbow to Flange B2 each 85 − 95 lb−in. (9.604 − 10.734 N.m).

(3) Install pneumatic lines.
(a) Remove protective covers from lower ends of upper section of pneumatic lines.
(b) Remove existing bolts, washers and nuts from Flange C holes 101,102.
(c) Remove two (2) screws attaching tube guide to bracket, position upper pneumatic line sections along Flange C and through guide bracket. Reinstall screws in guide and torque to 20 − 25 lb−in. (2.258 − 2.823 N.m).
(d) With upper support bracket over holes 101,102, install bolts, washers and nuts attaching pneumatic line support bracket to Flange C. Torque 85 − 95 lb−in. (9.604 − 10.734 N.m).
(e) Remove existing bolts, washers and nuts from Flange C holes 95,96. Install bolts, washers and nuts attaching pneumatic line support bracket to Flange C holes 95,96. Torque 85 − 95 lb−in. (9.604 − 10.734 N.m).
(f) Remove existing bolts, washers and nuts from Flange C holes 89,90. Install bolts, washers and nuts attaching pneumatic line support bracket to Flange C holes 89,90. Torque 85 − 95 lb−in. (9.604 − 10.734 N.m).
(g) Remove existing bolts, washers and nuts from Flange C holes 84,85. Install bolts, washers and nuts attaching pneumatic line support bracket to Flange C holes 84,85. Torque 85 − 95 lb−in. (9.604 − 10.734 N.m).

POWER PLANT GENERAL − FAN CASE − INSTALLATION−09

(h) Remove protective covers from both ends of lower pneumatic line section and from pneumatic line receptacles on valve.
(i) Connect both lines of the lower section to upper section. Torque couplings 270 − 300 lb−in. (30.506 − 33.895 N.m).
(j) Remove existing bolts, washers and nuts from Flange C holes 78,79. Install bolts, washers and nuts attaching pneumatic line support bracket to Flange C holes 78,79. Torque 85 − 95 lb−in. (9.604 − 10.734 N.m).
(k) Install screw and nut attaching two (2) pneumatic line clamps, with pneumatic lines, to support bracket mounted on PDU support.
(l) Remove existing bolts, washers and nuts from Flange C holes 65,66. Install bolts, washers and nuts attaching pneumatic line support bracket to Flange C holes 65,66. Torque 85 − 95 lb−in. (9.604 − 10.734 N.m).
(m) Connect both pneumatic lines to respective receptacle on regulating and shutoff valve. Torque couplings 270 − 300 lb−in. (30.506 − 33.895 N.m).

POWER PLANT GENERAL - FAN CASE - INSTALLATION-10

Task 71-00-33-450-005:

1. Install Thrust Reverser Main Drive Flexible Shaft

A. Equipment And Materials Required

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
AS20995C32				
Lockwire, As Required				

B. Procedure

See Figure 401.

(1) Remove protective cover from both ends of flexible shaft and from shaft receptacles on PDU and on splitter gearbox.

(2) Arrange flexible shaft vertically on upper-left fan case with wide support bracket at bottom.

(3) Loosen two (2) screws and washers on splitter gearbox flexible shaft receptacle.

(4) Insert hexagonal end of shaft into hexagonal receptacle on splitter gearbox. Rotate shaft mounting plate to capture mounting screws. Rotate flexible shaft so shaft support brackets fit against fan case Flange B2. Tighten and lockwire mounting screws.

(5) Loosen two (2) screws and washers on PDU flexible shaft receptacle.

(6) Insert hexagonal end of shaft into hexagonal receptacle on PDU. Rotate shaft mounting plate to capture mounting screws. Tighten and lockwire mounting screws.

(7) Install bolts, washers and nuts attaching two (2) shaft support brackets to Flange B2 holes 112,113; 107,108. Torque nuts 62 - 72 lb-in. (7.005 - 8.135 N.m).

(8) Remove existing bolts, washers and nuts from Flange C holes 91,92; 86,87; 80,81.

(9) Position shaft support brackets over holes 91,92; 86,87; 80,81 on Flange C.

(10) Install bolts, washers and nuts attaching three (3) shaft support brackets to Flange C. Torque nuts 85 - 95 lb-in. (9.604 - 10.734 N.m).

(11) Remove existing bolt, washer and nut from Flange C hole 75.

(12) Position shaft support bracket over Flange C hole 75.

(13) Install bolt, washer and nut attaching one (1) end of bracket to Flange C. Torque nut 85 - 95 lb-in. (9.604 - 10.734 N.m).

(14) Position other end of bracket over Flange B2 holes 83,84.

Previous Pageblock Return to Previous Menu Next Pageblock

Task 71−00−33−450−003:

1. Install Thrust reverser Pneumatic Drive Unit (PDU)
    - A. Equipment And Materials Required − None
    - B. Procedure
        - (1) Install PDU support brackets. See Figure 401.
            - (a) Remove existing bolts, washers and nuts from Flange C holes 67,68.
            - (b) Position PDU support bracket over Flange C holes 67,68.
            - (c) Install bolts, washers and nuts attaching support bracket to Flange C. Torque nuts 85 − 95 lb−in. (9.604 − 10.734 N.m).
            - (d) Position other end of bracket over Flange B2 holes 75,76.
            - (e) Install bolts, washers and nuts attaching support bracket to Flange B2. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).
            - (f) Remove existing bolts, washers and nuts from Flange C holes 71,72.
            - (g) Position PDU support bracket over Flange C holes 71,72.
            - (h) Install bolts, washers and nuts attaching support bracket to Flange C. Torque nuts 85 − 95 lb−in. (9.604 − 10.734 N.m).
            - (i) Position other end of bracket over Flange B2 hole 78,79.
            - (j) Install bolts, washers and nuts, attaching support bracket to Flange B2. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).
            - (k) Position PDU support bracket over Flange B1 holes 74,75 and Flange A1 holes 74,75.
            - (l) Install bolts, washers and nuts attaching support bracket to Flanges B1 and A1. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).
            - (m) Position PDU support bracket over Flange B1 holes 78,79 and Flange A1 holes 78,79.
            - (n) Install bolts, washers and nuts attaching support bracket to Flanges B1 and A1. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).
        - (2) Install PDU. See Figure 402.
            - (a) Position PDU on four (4) PDU support brackets.
            - (b) Install bolts, washers and nuts attaching PDU to four (4) support brackets.
        - (3) Install flexible duct. See Figure 403.
            - (a) Remove protective cover from PDU end of flexible duct and from PDU port.
            - (b) Position flexible duct against PDU port.

(c) Verify that outside diameters of mating flanges are aligned radially within 0.06 inch (1.524 mm), and angular gap between mating faces of flanges is not greater than 0.04 inch (1.016 mm).
(d) Install coupling attaching flexible duct to PDU. Tighten coupling fingertight.
(e) Install bolts, washers and nuts attaching support link bracket to Flange B2 holes 69,70. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).
(f) Install bolt, washer and nut attaching support link to flexible duct. Torque nut 50 − 70 lb−in. (5.649 − 7.909 N.m).
(g) Torque coupling attaching flexible duct to PDU to value indicated on coupling. Tap around coupling with plastic mallet. Retorque coupling.

C. Postrequisites
(1) Install Thrust Reverser Main Drive Flexible Shaft. See Installation−10 (Task 71−00−33−450−005).

POWER PLANT GENERAL − FAN CASE − INSTALLATION−12

Task 71−00−33−450−007:

1. Install Thrust Reverser Solenoid Operated Selector Valve
   - A. Equipment And Materials Required − None
   - B. Procedure

     See Figure 401.
     - (1) Position selector valve mounting bracket, with selector valve, over Flange A1 holes 83,84 and Flange B1 holes 83,84.
     - (2) Install four (4) bolts, washers and nuts attaching selector valve mounting bracket to Flange A1 and B1. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).
     - (3) Position flexible hose support bracket, with flexible hoses, over Flange A1 holes 80,81.
     - (4) Install two (2) bolts, washers and nuts attaching flexible hose support bracket to Flange A1. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).

POWER PLANT GENERAL − FAN CASE − INSTALLATION−13

Task 71−00−33−450−006:

1. Install Thrust Reverser Splitter Gearbox
    A. Equipment And Materials Required − None
    B. Procedure
        See Figure 401.
        (1) Remove existing bolts, washers and nuts from Flange C holes 108,1.
        (2) Position splitter gearbox mounting bracket, with splitter gearbox, over Flange C holes 108,1 and Flange B1 holes 120,1.
        (3) Install two (2) bolts, washers and nuts attaching splitter gearbox mounting bracket to Flange C. Torque nuts 85 − 95 lb−in. (9.604 − 10.734 N.m).
        (4) Install two bolts, washers and nuts attaching splitter gearbox mounting bracket to Flange B2. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).

POWER PLANT GENERAL - FAN CASE - INSTALLATION-14

Task 71-00-33-450-014:

1. Install Fan Case Wire Harness - Pre SB PW4NAC 71-100

A. Equipment and Materials Required

Standard Tools:
Glenair TG-69 Soft Jawed Pliers
Glenair TG-70 Strap Wrench or

Special Tools:
RSE1151 PW Interface Locator
RSE1152 PW Interface Locator

Consumable Materials:

Item No.	Designation
P11-009	Alcohol, Denatured Ethyl (AMS 3002)

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Lockwire, MS20995C32				

B. Procedure

(1) Install RSE1152 Interface Locator Tool. See Figure 401.
   (a) Position tool on upper right fan case between Flanges A and A1, aligning hole in aft support angle of tool with hole 5 of Flange A.
   (b) Place larger alignment hole in forward locating plate of tool onto fastener on Flange A.
   (c) Secure tool by inserting lockpin through tool.

(2) Install RSE1151 Interface Locator Tool. See Figure 402.
   (a) Position tool on upper left fan case between Flanges A and A1, aligning hole in aft support angle of tool with hole 116 on Flange A1.
   (b) Place large alignment hole in forward locating plate of tool onto fastener on Flange A.
   (c) Secure tool by inserting lockpin through Flange A1 hole 116 and through tool.

(3) Install wire harnesses 21W4068, 21W4116 and 21W4140. See Figures 403, 404 and 405.
   (a) Position wire harness support bracket (1) over holes 80, 81 on fan case Flange A1. Install two bolts, washers and nuts attaching support bracket (1) to Flange A1. Torque nuts 62 - 72 lb-in. (7.005 - 8.135 N.m).

(b) Remove protective cover from connector plug and receptacle and connect electrical connector DH15 to receptacle on T/R selector valve. Tighten connector fingertight plus one–eighth turn. Lockwire connector.

(c) Remove protective cover from connector plug and receptacle and connect electrical connector DS304 to receptacle on PDU. Tighten connector fingertight plus one–eighth turn. Lockwire connector.

(d) Install two harness support brackets (2).
   - 1 Remove existing bolts, washers and nuts from holes 78, 79 and 75 on Flange A1.
   - 2 Position two support brackets (2) over holes 78, 79 and 75, 76 on Flange A1.
   - 3 Install bolts, washers and nuts attaching support brackets (2) and PDU support to Flange A1.
   - 4 Torque nuts 62 – 72 lb–in. (7.005 – 8.135 N.m).

(e) Position three harness support brackets (2) over holes 72, 73; 69, 70 and 66, 67 on fan case Flange A1. Install bolts, washers and nuts attaching three support brackets (2) to Flange A1. Torque nuts 62 – 72 lb–in. (7.005 – 8.135 N.m).

(f) Position harness support bracket (3) over holes 67, 68 on fan case Flange B1. Install two bolts, washers and nuts attaching support brackets (3) to Flange B1. Torque nuts 62 – 72 lb–in. (7.005 – 8.135 N.m).

(g) Remove protective cover from connector plug and receptacle and connect electrical connector DH9 to receptacle on T/R regulating and shutoff valve. Tighten connector fingertight plus one–eighth turn. Lockwire connector.

(h) Install harness support bracket (2).
   - 1 Remove existing bolt, washer and nut from hole 63 on Flange A1.
   - 2 Position support bracket (2) over holes 63, 64 on Flange A1.
   - 3 Install bolts, washers and nuts attaching support bracket (2) and anti–ice duct support link bracket to Flange A1.
   - 4 Torque nuts 62 – 72 lb–in. (7.005 – 8.135 N.m).

     NOTE: Harness installation continues on fan case lower right quarter. See Figure 404.

(i) Install harness support bracket (2).

1 Remove existing bolt, washer and nut from hole 61 on Flange A1.
2 Position support bracket (2) over holes 60, 61 on Flange A1.
3 Install bolts, washers and nuts attaching support bracket (2) and anti−ice duct support link bracket to Flange A1.
4 Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).

(j) Position wire harness support bracket (2) over holes 57, 58 on fan case Flange A1. Install two bolts, washers and nuts attaching support bracket (2) to Flange A1. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).

(k) Position wire harness support bracket (4) over holes 56, 57 on fan case Flange B1. Install two bolts, washers and nuts attaching support bracket (4) to Flange B1. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).

(l) Position wire harness support bracket (5) over holes 54, 55 on fan case Flange B2. Install two bolts, washers and nuts attaching support bracket (5) to Flange B2. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).

(m) Remove existing bolts, washers and nuts from Flange C holes 45, 46 and 48, 49. Position two wire harness support brackets (6) over holes 48, 49 and 45, 46 on fan case Flange C. Install bolts, washers and nuts attaching two support brackets (6) to Flange C. Torque nuts 85 − 95 lb−in. (9.604 − 10.734 N.m).

(n) Remove existing bolts, washers and nuts from Flange C holes 40, 41 and 42, 43. Position two wire harness support brackets (7) over holes 42, 43 and 40, 41 on fan case Flange C. Install bolts, washers and nuts attaching two support brackets (7) to Flange C. Torque nuts 85 − 95 lb−in. (9.604 − 10.734 N.m).

(o) Position wire harness support bracket (8) over holes 47, 48 on fan case Flange B2. Install two bolts, washers and nuts attaching support bracket (8) to Flange B2. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).

(p) Attach screw, nut and cable clamp (9), with wire harness, to existing support bracket on Flange B1. See Figure 404, View B.

(q) Remove protective cover from connector plug and receptacle and connect electrical connector DV220 to receptacle on anti−ice shutoff and regulating valve. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(r) Remove protective cover from connector plug and receptacle and connect electrical connector DS300 to receptacle on anti−ice pressure switch. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(s) Position wire harness support bracket (10) over holes 43, 44 on fan case Flange B2. Install two bolts, washers and nuts attaching support bracket (10) to Flange B2. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).

(t) Position wire harness support bracket (11) over holes 42, 43 on fan case Flange B1. Install two bolts, washers and nuts attaching support bracket (11) to Flange B1. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).

(u) Position wire harness support bracket (12) over holes 40, 41 on fan case Flange A1. Install two bolts, washers and nuts attaching support bracket (12) to Flange A1. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).

(v) Position wire harness support bracket (5) over holes 43, 44 on fan case Flange A1. Install two bolts, washers and nuts attaching support bracket (5) to Flange A1. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).

(w) Install harness support bracket (2).
  1 Remove existing bolts, washers and nuts from holes 45, 46 on Flange A1.
  2 Position support bracket (2) over holes 45, 46 on Flange A1.
  3 Install bolts, washers and nuts attaching support bracket (2) and anti−ice duct support link bracket to Flange A1.
  4 Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).

(x) Install harness support bracket (13).
  1 Remove existing bolts, washers and nuts from holes 37, 38 on Flange A1.
  2 Position support bracket (13) over holes 37, 38 on Flange A1.
  3 Install bolts, washers and nuts attaching support bracket (13) and fan cowl door hold−open rod bracket to Flange A1.
  4 Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).

(y) Position two wire harness support brackets (13) holes 34, 35 and 31, 32 on fan case Flange A1. Install bolts, washers and nuts attaching two support brackets (13) to Flange A1. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).

NOTE: Harness installation continues on fan case upper right quarter. See Figure 405.

(z) Connect D4970P, D4963, and D4967P to interface locator tool.

(aa) Position three wire harness support bracket (13) over holes 28, 29; 25, 26 and 22, 23 on fan case Flange A1. Install bolts, washers and nuts attaching three support brackets (13) to Flange A1. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).

(ab) Position harness support bracket (11) over holes 21, 22 on fan case Flange B1. Install two bolts, washers and nuts attaching support bracket (11) to Flange B1. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).

(ac) Remove protective cover from connector plug and receptacle and connect electrical connector D5011P to receptacle on right T/R J−box. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(ad) Position four wire harness support brackets (14) over holes 19, 20; 16, 17; 13, 14 and 10, 11 on fan case Flange A1. Install bolts, washers and nuts attaching four support brackets (14) to Flange A1. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).

(ae) Position harness support bracket (15) over holes 8, 9 on fan case Flange A1. Install two bolts, washers and nuts attaching support bracket (15) to Flange A1. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).

(af) Remove screw and nut attaching clamp (16) to bracket (15). Insert existing wire harness from vibration accelerometer into clamp (16). Reattach clamp (16), screw and nut to bracket (15). See Figure 405, View A.

(4) Install wire harnesses 21W4076, 21W4132 and 21W4150. See Figure 406.

(a) Connect D4989P, D4953P, and D4966P to interface locator tool.

(b) Position harness support bracket (17) over holes 6, 7 on fan case Flange B2. Install two bolts, washers and nuts attaching support bracket (17) to Flange B2. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).

(c) Straighten and lay out wire harnesses, brackets and electrical connectors that are to go across the top of the fan case to the upper left side.

(d) Position two harness support brackets (18) over holes 4, 5 and 1, 2 on fan case Flange B1. Install bolts, washers and nuts attaching two support brackets (18) to Flange B1. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).

(e) Remove screw and nut attaching harness clamps to two brackets (18). Insert existing wire harness (19) into clamp (20). Reattach clamps, screw and nut to bracket (18).

(f) Install harness support bracket (21).
   1 Remove existing bolts, washers and nuts from holes 9, 10 on Flange B2.
   2 Position support bracket (21) over holes 9, 10 on Flange B2.
   3 Install bolts, washers and nut attaching support bracket (21) and PMUX support to Flange B2.
   4 Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).

(g) Install harness support bracket (22).
   1 Remove existing bolts, washers and nuts from holes 11, 12 on Flange B2.
   2 Position support bracket (22) over holes 11, 12 on Flange B2.
   3 Install bolts, washers and nuts attaching support bracket (22) and multiplexer support to Flange B2.
   4 Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).

(h) Remove screw and nut attaching harness clamps to support bracket (22). Insert existing wire harness (19) into clamp (23). Reattach clamps, screw and nut to bracket (22).

(i) Attach screw, nut and harness clamp (24), with wire harness, to existing support bracket on Flange B2.

(j) Remove protective cover from connector plugs and receptacles and connect electrical connectors D5006, D5010P and D5007P to their respective receptacles on right T/R J−box. Tighten connectors fingertight plus one−eighth turn. Lockwire connector.

(5) Install wire harnesses 21W4076, 21W4132 and 21W4150. See Figure 407.

(a) Straighten and lay out wire harnesses, brackets and electrical connectors that were passed across the top of the fan case from upper right side.

(b) Connect D4998P and D4999P to interface locator tool.

(c) Position harness support bracket (18) over holes 118, 119 on fan case Flange B1. Install two bolts, washers and nuts attaching support bracket (18) to Flange B1. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).

(d) Remove screw and nut attaching harness clamps to bracket (18). Insert existing wire harness (19), that joins wire harness (25), into clamp (20). Reattach clamps, screw and nut to bracket (18).

(e) Position harness support bracket (18) over holes 115, 116 on fan case Flange B1. Install two bolts, washers and nuts attaching support bracket (18) to Flange B1. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).

(f) Position harness support bracket (26) over holes 112, 113 on fan case Flange B1. Install two bolts, washers and nuts attaching support bracket (26) to Flange B1. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).

(g) Connect electrical connector D5002P to respective receptacle on left T/R J−box as follows.

  1 Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol (P11−009). Let dry.

  2 Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

  NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

  CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS

VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

3 Use the (Glenair TG−70) strap wrench or the (Glenair TG−69) soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).

This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

See the instructions given with the strap wrench for correct use.

(6) Install wire harnesses 21W4118, and 21W4120. See Figure 408.
  (a) Attach clamps (27, 28), with harnesses, screw and nut to forward edge of left T/R J−box.
  (b) Position harness support bracket (29) over holes 105, 106 on fan case Flange A1. Install two bolts, washers and nuts attaching support bracket (29) to Flange A1. Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).
  (c) Remove screw and nut attaching existing harness clamps to support bracket on Flange B1 above center of EEC. Position harness clamp (28), with harness 21W4120, over support bracket. Attach harness clamp (28), screw and nut to support bracket, including existing clamps.
  (d) Install harness support bracket (30).
    1 Remove bolts, washers and nuts from holes 104, 105 of Flange B2.
    2 Position wire harness support bracket (30) over holes 104, 105 on fan case Flange B2.
    3 Install two bolts, washers and nuts attaching support bracket (30), EEC support and hydraulic tubing support to Flange B2.
    4 Torque nuts 62 − 72 lb−in. (7.005 − 8.135 N.m).
  (e) Attach screw, nut and harness clamp (28), with wire harnesses, to existing support bracket on each side of EEC.

(f) Connect two electrical connectors D50001P and D5000P to respective receptacles on EEC as follows.

1 Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol (P11−009). Let dry.

2 Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

3 Use the (Glenair TG−70) strap wrench or the (Glenair TG−69) soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).

This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

See the instructions given with the strap wrench for correct use.

(g) Connect electrical connectors D5020P, D5021P and D5022P to respective receptacles on left T/R J−box as follows.

1 Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol (P11−009). Let dry.

2 Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

3 Use the (Glenair TG−70) strap wrench or the (Glenair TG−69) soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).

This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

See the instructions given with the strap wrench for correct use.

C. Postrequisites

Figure 408
(Task 71−00−33−450−014)

Task 71−00−33−450−014−A:

2. Install Fan Case Wire Harness − Post SB PW4NAC 71−100

A. Equipment and Materials Required

Standard Tools:
Glenair TG−69 Soft Jawed Pliers
Glenair TG−70 Strap Wrench or

Special Tools:
RSE1151 PW Interface Locator
RSE1152 PW Interface Locator

Consumable Materials:

Item No.	Designation
P11−009	Alcohol, Denatured Ethyl (AMS 3002)

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Lockwire, MS20995C32				

B. Procedure
- (1) Install RSE1152 Interface Locator Tool. See Figure 409.
  - (a) Position tool on upper right fan case between Flanges A and A1, aligning hole in aft support angle of tool with hole 5 of Flange A.
  - (b) Place larger alignment hole in forward locating plate of tool onto fastener on Flange A.
  - (c) Secure tool by inserting lockpin through Flange A1 hole 5 and through tool.
- (2) Install RSE1151 Interface Locator Tool. See Figure 410.
  - (a) Position tool on upper left fan case between Flanges A and A1, aligning hole in aft support angle of tool with hole 116 on Flange A1.
  - (b) Place large alignment hole in forward locating plate of tool onto fastener on Flange A.
  - (c) Secure tool by inserting lockpin through Flange A1 hole 116 and through tool.
- (3) Install wire harnesses 21W4068, 21W4116 and 21W4140.
  - (a) Remove protective covers and connect electrical connectors DH15 to thrust reverer selector valve, DS304 to PDU, and DH9 to thrust reverser regulating and shutoff valve. Tighten connectors fingertight plus one−eighth turn. Lockwire connectors. See Figure 411.

   (b) Install harenesses, clamps, and attaching hardware on brackets (31, 32, 33). Torque nuts 32 − 36 lb−in. (3.616 − 4.067 N.m).
   (c) Remove protective covers and connect electrical connectors DV220 to anti−ice shutoff and regulating valve, and DS300 to anti−ice pressure switch. Tighten connector fingertight plus one−eighth turn. Lockwire connectors. See Figure 412.
   (d) Install grounding wire to stud using attaching hardware. Torque nut to 20 − 25 lb−in. (2.26 − 2.82 N.m).
   (e) Install harnesses, clamps, and attaching hardware to brackets (21 through 31). Torque nuts 32 − 36 lb−in. (3.616 − 4.067 N.m).
   (f) Remove protective covers and connect electrical connectors D4970P, D4963P, and D4967P to RSE1152 tool, DT588 to vibration accelerometer, and D5011P and D5053P to right thrust reverser J−box. Tighten connectors fingertight plus one−eighth turn. Lockwire connectors. See Figure 413.
   (g) Install harnesses, clamps, and attaching hardware to brackets (14 through 20). Torque nuts 32 − 36 lb−in. (3.616 − 4.067 N.m).

(4) Install wire harnesses 21W4075, 21W4076, 21W4132, and 21W4150. See Figure 413.
   (a) Position harnesses on top of fan case and drape over to upper left side.
   (b) Remove protective covers and connect electrical connectors D4989P, D4953P, and D4966P to RSE1152 tool; D5019J, D5008P, and D4987J to bracket (9); and D5006P, D5007P, D5051P, and D5010P to right thrust reverser J−box. Tighten connectors fingertight plus one−eighth turn. Lockwire connectors.
   (c) Install harnesses, clamps, and attaching hardware to brackets (10 through 13) to fan case. Torque nuts 32 − 36 lb−in. (3.616 − 4.067 N.m).

(5) Install wire harness 21W4083.
   (a) Remove protective covers and connect electrical connector D5052P to right side J−box and electrical connect DS308 to barometric switch. See Figure 413.

(6) Install wire harnesses 21W4076, 21W4132, and 21W4150.
   (a) Straighten and lay out wire harnesses that were passed across the top of the fan case from upper right side. See Figure 414.
   (b) Connect electrical connector D5002P to left thrust reverser J−box as follows:

1 Remove the protective covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, clean the connector and receptacle with Denatured Alcohol (P11−009). Allow hardware to dry.

2 Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nuts.

CAUTION: USE THE CORRECT ASSEMBLY PROCEDURE AND TOOLS FOR THE HARNESS CONNECTOR INSTALLATION. IF YOU USE THE INCORRECT ASSEMBLY PROCEDURE OR TOOLS, A DAMAGED OR LOOSE CONNECTION CAN OCCUR. A LOOSE CONNECTOR PERMITS VIBRATION, WHICH CAN CAUSE THE CONTACTS TO WEAR AND THEREBY PROVIDE UNSATISFACTORY LIGHTNING PROTECTION.

3 Use the (Glenair TG−70) strap wrench or the (Glenair TG−69) soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
−the connector coupling nut is fully tight
−the connector fits tightly against the receptacle (metal−to−metal).

This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent over torquing.

See the instructions provided with the strap wrench for correct use.

(c) Remove protective covers and connect electrical connectors D4986J and D5018J to bracket (5). Tighten connectors fingertight plus one−eighth turn.

(d) Install harnesses clamps, and attaching hardware to brackets (6, 7, 8). Torque nuts 32 − 36 lb−in. (3.616 − 4.067 N.m). See Figure 414 (Sheet 1).

(7) Install wire harnesses 21W4118 and 21W4120.

(a) Remove protective covers and connect electrical connectors D4998P and D4999P to RSE1151 tool. Tighten connectors fingertight plus one−eighth turn. Lockwire connectors. See Figure 414 (Sheet 2).

(b) Connect electrical connectors D5020P, D5021P, and D5022P to left thrust reverser J−box; and D5001P and D5000P to EEC as follows:

1 Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol (P11−009). Allow hardware to dry.

2 Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent over torquing.

CAUTION: USE THE CORRECT ASSEMBLY PROCEDURE AND TOOLS FOR THE HARNESS CONNECTOR INSTALLATION. IF YOU USE THE INCORRECT ASSEMBLY PROCEDURE OR TOOLS, A DAMAGED OR LOOSE CONNECTOR CAN OCCUR. A LOOSE CONNECTOR PERMITS VIBRATION, WHICH CAN CAUSE THE CONTACTS TO WEAR AND THEREBY PROVIDE UNSATISFACTORY LIGHTNING PROTECTION.

3 Use the (Glenair TG−70) strap wrench or the (Glenair TG−69) soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
− the connector coupling nut is fully tight

- the connector fits tightly against the receptacle (metal to metal).

This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent over torquing.

See the instructions given with the strap wrench for correct use.

(c) Install harnesses, clamps (1, 2), and attaching hardware to brackets (3, 4), Flanges (A, B, C), harness support, and left thrust reverser J-box. Torque nuts 32 - 36 lb-in. (3.616 - 4.067 N.m).

C. Postrequisites

(1) Install inlet cowl. See Installation-01 (Task 71-00-33-450-001).

Figure 414 (Sheet 2)
(Task 71−00−33−450−014−A)

POWER PLANT GENERAL - FAN CASE - INSTALLATION-15

Task 71-00-33-450-019:

1. Install EEC Inlet Pressure/Temperature (PT2/TT2) Probe
   A. Equipment And Materials Required

      Standard Tools:
      Glenair TG-70 Strap Wrench or
      Glenair TG-69 Soft Jawed Pliers

      Consumable Materials:

Item No.	Designation
P11-009	Alcohol, Denatured Ethyl (AMS 3002)

   B. Procedure
      See Figure 401.
      (1) Position probe on inlet cowl inner barrel mounting bracket and align boltholes.
      (2) Using longer bolt with washer, attach bonding wire terminal to inlet probe flange at a forward mounting bolthole position.
      (3) Install five remaining mounting bolts and washers. Torque all six bolts to 32 - 36 lb-in. (3.616 - 4.067 N.m).

      CAUTION: USE OF LUBRICANTS ON EEC SENSING TUBES, ADAPTERS, OR PACKINGS COULD RESULT IN CONTAMINATION OF EEC.

      (4) Remove protective covers from pneumatic pressure line and inlet probe fitting and connect pressure line coupling nut to probe fitting. Torque coupling nut 90 - 100 lb-in. (10.169 - 11.298 N.m).
      (5) Connect the DH11A and the DH11B harness connectors to the probe harness receptacles as follows. For each connector:
         (a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol (P11-009). Let dry.

EEC Inlet Pressure/Temperature
PT2/TT2 Probe
Figure 401
(Task 71−00−33−450−019)

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the (Glenair TG−70) strap wrench or the (Glenair TG−69) soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).

This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

See the instructions given with the strap wrench for correct use.

(6) Reinstall access cover on inlet cowl with 12 bolts. Sequentially torque bolts 32 − 36 lb−in. (3.616 − 4.067 N.m).

POWER PLANT GENERAL - FAN CASE - INSTALLATION-16

Task 71-00-33-450-020:

1. Install Maintenance Interphone Jack
   - A. Equipment And Materials Required - None
   - B. Procedure

     See Figure 401.
     - (1) Install screws (401/7), washers (401/8), lockwashers (401/9) and nuts (401/10) attaching wires to maintenance interphone jack (401/6). Torque nuts to 20 - 25 lb-in. (2.260 - 2.825 N.m).
     - (2) Slide shell (401/11) over jack and wire connections.
     - (3) Screw coupling nut (401/15), on shell holding gland (401/14), pressure plates (401/13) and retainer (401/12) in place.
     - (4) Attach mounting plate (401/5) to jack with nut (401/17), washer (401/16), and lockwasher (401/4). Torque nut to 110 - 120 lb-in. (12.428 - 13.558 N.m).
     - (5) Attach cover (401/3) to mounting plate (401/5) and retainer (401/12) with four screws (401/2). Tighten screws to 8 - 10 lb-in. (0.904 - 1.130 N.m).
     - (6) Insert jack assembly and cover into inlet cowl and attach with six screws (401/1). Torque screws to 20 - 25 lb-in. (2.260 - 2.825 N.m).

Task 71-00-33-450-021:

1. Install Inlet Cowl Anti-Ice Shutoff And Regulating Valve

A. Prerequisites

(1) Install anti-ice valve inlet and outlet ducts. See
R Installation-18 (Task 71-00-33-450-022).

B. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P06-013	Solid Film Lubricant

C. Procedure

(1) Install anti-ice shutoff and regulating valve. See Figure 401.

(a) Remove protective covers from end of valve inlet and outlet ducts.

(b) Remove protective covers from both ends of valve.

(c) Lubricate inside surfaces of duct coupling with Lubricant P06-013.

CAUTION: OBSERVE DIRECTION OF ARROW ON VALVE. POINT ARROW TOWARD ANTI-ICE VALVE OUTLET DUCT.

(d) Install coupling and seal to valve aft flange and attach valve to anti-ice valve inlet duct. Tighten coupling fingertight.

(e) Lubricate inside surfaces of duct coupling with Lubricant P06-013.

(f) Install coupling to valve forward flange and attach valve to anti-ice outlet duct. Tighten coupling fingertight.

(2) Install anti-ice valve pressure sensing tube. See Figure 402.

(a) Remove protective cover from sensing tube and valve port.

POWER PLANT GENERAL − FAN CASE − INSTALLATION−17

(b) Position TAI valve locator bracket on fan case Flange B1 over holes 48 and 49. Install two (2) bolts, washers, and nuts attaching bracket to Flange B1. Torque nuts 75 − 85 lb−in. (8.474 − 9.604 N.m).

(c) Adjust valve position and connect pressure sensing tube to union on valve. Torque tube connecting nut to 180 − 200 lb−in. (20.337 − 22.597 N.m).

(3) Torque two (2) duct couplings to value indicated on each coupling. Tap around coupling with plastic mallet. Retorque coupling.

Task 71-00-33-450-022:

1. Install Inlet Cowl Anti-Ice System Ducts

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P06-013	Solid Film Lubricant

B. Procedure

(1) Install anti-ice inlet duct. See Figures 401 and 402.

(a) Install bolts, washers and nuts attaching five (5) support link brackets to fan case flanges using flange holes shown in Table 401. Torque nut 75 - 85 lb-in. (8.474 - 9.604 N.m).

Support Link	Flange	Holes
A	B1	61,62
B	A1	61,63
C	A1	52,53
D	A	52,53
E	B1	49,50
E	A1	49,50

Support Link Bracket Mounting Holes
Table 401

(b) Check and, if necessary, set five (5) support links to nominal length. See Figure 401 for lengths. Torque locking nuts 100 - 140 lb-in. (11.298 - 15.818 N.m).

(c) Install five (5) support links to their respective inlet duct bracket with bolts, washers and nuts. Torque bolts 50 - 70 lb-in. (5.649 - 7.909 N.m).

(d) Remove protective covers from anti-ice duct T-section port and duct opening that connects to T-section port.

(e) Install bolts, washers and nuts attaching five (5) duct support links to support link brackets on fan case. Torque nuts 50 - 70 lb-in. (5.649 - 7.909 N.m).

(f) Lubricate inside surfaces of duct coupling with Lubricant (P06-013).

Anti−Ice Valve Inlet Duct
Figure 402
(Task 71−00−33−450−022)

(g) Attach duct to anti−ice T−section with coupling and seal. Torque coupling to value indicated on coupling. Tap around coupling with plastic mallet. Retorque coupling.

(2) Install anti−ice valve outlut duct. See Figures 403 and 404.

(a) Install bolts, washers and nuts attaching two (2) support link brackets to fan case Flanges A1 and B1. Use flange holes 45, 46 for Support Link A and holes 47, 48 for Support Link B. Torque nuts 75 − 85 lb−in. (8.474 − 9.604 N.m).

(b) Check and, if necssary, set two (2) support links to nominal length. See Figure 403 for lengths. Torque nuts 100 − 140 lb−in. (11.298 − 15.818 N.m).

(c) Install bolts, washers and nuts attaching two (2) duct support links to their respective brackets on the outlet duct (see Figure 404). Torque nuts 75 − 85 lb−in. (8.474 − 9.604 N.m).

(d) Remove protective cover from inlet cowl port and duct end that connects to inlet cowl.

(e) Install bolts, washers and nuts attaching two (2) duct support links to support link brackets on fan case (see Figure 404). Torque nuts 50 − 70 lb−in. (5.649 − 7.909 N.m).

(f) Lubricate inside surfaces of coupling with Lubricant (P06−013).

(g) Attach outlet duct to inlet cowl port with coupling. Torque coupling to value indicated on coupling. Tap around the coupling with plastic mallet. Retorque coupling.

Task 71−00−33−450−029:

1. Install Nacelle Cooling Tube Assemblies

A. Equipment And Materials Required − None

B. Procedure

(1) Install nacelle cooling tube assemblies (Post SB PW4NAC 78−40). See Figure 401.

(a) Install reducer in upper end of lower tube assembly (3). Torque tube coupling nut to 170 − 200 lb−in. (19.7 − 22.6 N.m).

(b) Attach lower tube assembly to three Flange C brackets with clamps, screws, and washers. Torque screws to 20 − 25 lb−in. (2.3 − 2.8 N.m).

(c) Install tee fitting on Flange C bracket just below splitter gearbox with washer and nut. Torque nut to 120 − 130 lb−in. (13.6 − 14.7 N.m).

(d) Install lower end of center tube assembly (2) to reducer and upper end to tee fitting. Torque lower coupling nut to 170 − 200 lb−in. (19.7 − 22.6 N.m). Torque upper coupling nut at tee fitting to 120 − 130 lb−in. (13.6 − 14.7 N.m).

(e) Attach center tube assembly to two brackets on Flange B2 and one bracket on Flance C with clamps, washers, and screws. Torque screws to 20 − 25 lb−in. (2.3 − 2.8 N.m).

(f) Install union on uppermost Flange C bracket with washer and nut. Torque nut to 120 − 130 lb−in. (13.6 − 14.7 N.m).

(g) Install lower end of upper tube assembly to tee fitting and upper end to union. Torque coupling nuts to 120 − 130 lb−in. (13.6 − 14.7 N.m).

(h) Install clamp on upper tube assembly and attach to adjacent pneumatic tube clamp on splitter gearbox bracket with washer and screw. Torque screw to 20 − 25 lb−in. (2.3 − 2.8 N.m).

Nacelle Cooling Tube Assemblies (Post SB PW4NAC 78–40)
Figure 401
(Task 71–00–33–450–029)

POWER PLANT GENERAL - FAN CASE - INSTALLATION-20

Task 71-00-33-450-033:

1. Install Heat Diffuser Assembly - Post SB PW4NAC 78-21 And Pre SB PW4NAC 78-40

   A. Equipment And Materials Required - None

   B. Procedure

   See Figures 401 and 402.

   (1) On left side of fan case, insert upper tube assembly (401/1) beneath PDU mounting brackets between Flanges B2 and C.

   (2) Install union (401/3) between upper and lower tube assemblies (401/1) and (401/2). Torque union to 125 - 140 lb-in. (14.12 - 15.82 N.m). Torque remaining tube coupling at union to 140 - 150 lb-in. (15.82 - 16.95 N.m).

   (3) Position joined tube assemblies along Flange B2 and attach three places with clamps (401/4), bolts (401/5), nuts (401/6), and washers (401/7). Torque nuts to 20 - 25 lb-in. (2.26 - 2.83 N.m).

   (4) Attach lower end of tube assembly (401/2) to tee fitting at mounting bracket. Torque tube coupling to 140 - 150 lb-in. (15.82 - 16.95 N.m).

   (5) Install union (401/8) in diffuser assembly (401/9). Orient smaller orifice of union toward diffuser assembly. Torque union to 270 - 300 lb-in. (30.51 - 33.90 N.m).

   (6) Attach diffuser assembly (401/9) to union (401/8). Torque tube coupling to 140 - 150 lb-in. (15.82 - 16.95 N.m).

   (7) Attach diffuser assembly to Flange B2 using bolts (401/10), washers (401/11), and nuts (401/12). Torque nuts to 50 - 70 lb-in. (5.65 - 7.91 N.m).

   (8) Install tube assembly (401/13) between tee duct assembly (401/14) and tee fitting. Torque tube coupling to 140 - 150 lb-in. (15.82 - 16.95 N.m).

   (9) On right side of fan case, install union (401/15) in upper tube assembly (401/16). Torque union to 125 - 140 lb-in. (14.12 - 15.82 N.m).

(10) Install lower tube assembly (401/17) to union. Torque tube coupling to 140 − 150 lb−in. (15.82 − 16.95 N.m).

(11) Position tube assemblies between Flanges C and B2 and attach four places along Flange B2 using clamps (401/18), screws (401/19), washers (401/20), and nuts (401/21). Torque nuts to 20 − 25 lb−in. (2.26 − 2.83 N.m).

(12) Install union (401/22) in end of upper tube assembly (401/16). Install larger orifice of union in tube assembly. Torque union to 270 − 300 lb−in. (30.51 − 33.90 N.m).

(13) Attach diffuser assembly (401/23) to union (401/22). Torque diffuser assembly coupling nut to 270 − 300 lb−in. (30.51 − 33.90 N.m).

(14) Attach diffuser assembly to Flange B2 using bolts (401/24), washers (401/25), and nuts (401/26). Torque nuts to 50 − 70 lb−in. (5.65 − 7.91 N.m).

(15) Attach lower end of tube assembly (401/17) to tee fitting. Torque tube coupling to 140 − 150 lb−in. (15.82 − 16.95 N.m).

Task 71−00−33−450−033−A:

2. Install Heat Diffuser Assembly − Post SB PW4NAC 78−21 And PW4NAC 78−40

A. Equipment And Materials Required − None

B. Procedure

See Figures 401 and 403.

(1) On left side of fan case, insert upper tube assembly (401/1) beneath PDU mounting brackets between Flanges B2 and C.

(2) Install union (401/3) between upper and lower tube assemblies (401/1) and (401/2). Torque union to 125 − 140 lb−in. (14.12 − 15.82 N.m). Torque remaining tube coupling at union to 140 − 150 lb−in. (15.82 − 16.95 N.m).

POWER PLANT GENERAL − FAN CASE − INSTALLATION−20

(3) Position joined tube assemblies along Flange B2 and attach three places with clamps (401/4), bolts (401/5), nuts (401/6), and washers (401/7). Torque nuts to 20 − 25 lb−in. (2.26 − 2.83 N.m).

(4) Attach lower end of tube assembly (401/2) to tee fitting at mounting bracket. Torque tube coupling to 140 − 150 lb−in. (15.82 − 16.95 N.m).

(5) Install union (401/8) in diffuser assembly (401/9). Orient smaller orifice of union toward diffuser assembly. Torque union to 270 − 300 lb−in. (30.51 − 33.90 N.m).

(6) Attach diffuser assembly (401/9) to union (401/8). Torque tube coupling to 140 − 150 lb−in. (15.82 − 16.95 N.m).

(7) Attach diffuser assembly to Flange B2 using bolts (401/10), washers (401/11), and nuts (401/12). Torque nuts to 50 − 70 lb−in. (5.65 − 7.91 N.m).

(8) Install tube assembly (401/13) between tee duct assembly (401/14) and tee fitting. Torque tube coupling to 140 − 150 lb−in. (15.82 − 16.95 N.m).

(9) On right side of fan case, install union (401/15) in lower end of center tube assembly (401/16). Torque union to 125 −140 lb−in. (14.12 − 15.82 N.m).

(10) Install lower tube assembly (401/17) to union. Torque tube coupling to 140 − 150 lb−in. (15.82 − 16.95 N.m).

(11) Install upper tee fitting (401/27) into upper end of center tube assembly (401/16). Torque tube coupling to 270 − 300 lb−in. (30.51 − 33.90 N.m).

(12) Install upper tube assembly (401/28) onto tee fitting (401/27). Torque tube coupling to 270 − 300 lb−in. (30.51 − 33.90 N.m).

(13) Position connected tube assemblies between Flanges C and B2 and attach four places along Flange B2 using clamps (401/18), screws (401/19), washers (401/20), and nuts (401/21). Torque nuts to 20 − 25 lb−in. (2.26 − 2.83 N.m).

(14) Install union (401/22) in upper end of upper tube assembly (401/28). Install larger orifice of union in tube assembly. Torque union to 270 − 300 lb−in. (30.51 − 33.90 N.m).

(15) Attach diffuser assembly (401/23) to union (401/22). Torque diffuser assembly coupling nut to 270 − 300 lb−in. (30.51 − 33.90 N.m).

(16) Attach diffuser assembly to Flange B2 using bolts (401/24), washers (401/25), and nuts (401/26). Torque nuts to 50 − 70 lb−in. (5.65 − 7.91 N.m).

(17) Attach lower end of tube assembly (401/17) to tee fitting. Torque tube coupling to 140 − 150 lb−in. (15.82 − 16.95 N.m).

(18) Connect pneumatic supply tube assembly to upper tee fitting (401/27). Torque tube coupling to 270 − 300 lb−in. (30.51 − 33.90 N.m).

POWER PLANT GENERAL - FAN CASE - INSTALLATION-22

Task 71-00-33-450-035:

1. Install EEC And RVDT Electrical Junction Box - Right Hand Side

A. Equipment And Materials Required

Standard Tools:

Name	Manufacturer
Wrench, Strap (Glenair TG-70)	Glenair International Corp 312 5th Ave. New Rochelle, NY 10802
Pliers, Soft-Jawed (optional) (Glenair TG-69)	Glenair International Corp 312 5th Ave. New Rochelle, NY 10802

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Lockwire, MS20995N20				

B. Procedure

See Figure 401.

(1) (Pre SB PW4NAC 71-100) Install the EEC J-Box (5) on the brackets on the right side of the fan case with screws (10), washers (15) and nuts (20). Torque the nuts to 20 - 25 lb-in. (2.3 - 2.8 N.m).

(2) (Post SB PW4NAC 71-100) Install the EEC J-Box (5) on the brackets on the right side of the fan case with screws (10) and washers (15). Torque the screws to 20 - 25 lb-in. (2.3 - 2.8 N.m).

(3) (Pre/Post SB PW4NAC 71-100) Align electrical connectors D5011P, D5052P, D5053P, D5007P, D5010P, D5006P and D5051P of wire harness keyways with mating receptacles.

NOTE: Witness (color) band is the first band receptacle.

(4) Tighten connectors D5011P, D5052P, D5053P, D5007P, D5010P, D5006P and D5051P coupling nuts until the witness (color) band on the receptacle is out of view and the coupling nuts are fingertight.

CAUTION: THE USE OF INCORRECT TOOLS CAN CAUSE DAMAGE TO THE CONNECTORS. LOOSE CONNECTORS CAN ALLOW ENGINE VIBRATION TO CAUSE CONTACTS TO WEAR AND CREATE UNSATISFACTORY LIGHTNING PROTECTION.

(5) Tighten the connector coupling nuts with a strap wrench (Glenair TG−70) or soft−jawed pliers (Glenair TG−69). Use sufficient force to ensure that the coupling nuts are fully tightened against the receptacles (metal to metal contact).

NOTE: When tools are used correctly, contacts will be sufficiently engaged and the connector coupling nuts will be tight. If excessive force is used, the tools will turn on the coupling nuts without tightening the nuts, preventing the nuts from being overtorqued.

(6) Lockwire the connectors.

POWER PLANT GENERAL - FAN CASE - INSTALLATION-23

Task 71-00-33-450-036:

1. Install EEC And RVDT Junction Box - Left Hand Side

A. Equipment And Materials Required

Standard Tools:

Name	Manufacturer
Wrench, Strap (Glenair TG-70)	Glenair International Corp 312 5th Ave. New Rochelle, NY 10802
Pliers, Soft-Jawed (optional) (Glenair TG-69)	Glenair International Corp 312 5th Ave. New Rochelle, NY 10802

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Lockwire, MS20995N20				

B. Procedure

See Figure 401.

(1) (Pre SB PW4NAC 71-100) Install the EEC J-Box (5) on the brackets on the left side of the fan case with screws (25), washers (30) and nuts (35). Torque the nuts to 50 - 70 lb-in. (5.7 - 7.9 N.m).

(2) (Post SB PW4NAC 71-100) Install the EEC J-Box (5) on the brackets on the left side of the fan case with screws (25) and washers (30). Torque the screws to 50 - 70 lb-in. (5.7 - 7.9 N.m).

(3) Attach wire harness (21W4120 and 21W4118) to the aft side of the J-Box (5) with clamps (20), screws (10) and washers (15). Torque the screws to 20 - 25 lb-in. (2.3 - 2.8 N.m).

(4) Align electrical connectors D5003P, D5021P, D5020P, D5022P and D5002P of wire harness keyways with mating receptacles.

NOTE: Witness (color) band is the first band receptacle.

(5) Tighten connectors D5021P, D5022P, D5002P, D5020P and D5003P coupling nuts until the witness (color) band on the receptacle is out of view and the coupling nuts are fingertight.

CAUTION: THE USE OF INCORRECT TOOLS CAN CAUSE DAMAGE TO THE CONNECTORS. LOOSE CONNECTORS CAN ALLOW ENGINE VIBRATION TO CAUSE CONTACTS TO WEAR AND CREATE UNSATISFACTORY LIGHTNING PROTECTION.

(6) Tighten the connector coupling nuts with a strap wrench (Glenair TG−70) or soft−jawed pliers (Glenair TG−69). Use sufficient force to ensure that the coupling nuts are fully tightened against the receptacles (metal to metal contact).

NOTE: When tools are used correctly, contacts will be sufficiently engaged and the connector coupling nuts will be tight. If excessive force is used, the tools will turn on the coupling nuts without tightening the nuts, preventing the nuts from being overtorqued.

(7) Connect W1P30P and W2P30P connectors.

(8) Lockwire the connectors.

(Task 71−00−33−450−036)

Task 71-00-33-450-037:

1. Install PS And P2 System Tubing

R A. Equipment And Materials Necessary

R Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine

B. Procedure
See Figure 401.

R (1) Lubricate the coupling nuts and clamp bolt (401/5) with Engine Oil P03-001.

R (2) Position P2 tube assembly (401/1), PS tube assembly (401/2), and two clamps (401/3, 401/4) on top of engine between Flanges A and A1. Using bolt (401/5), washer (401/6), and nut (401/7), loosely install clamps and tube assemblies to bracket located on forward face of Flange A1 at holes 3 and 4. Tighten nut fingertight.

R (3) Loosely connect PS and P2 tube assemblies to fittings at brackets on Flanges A1 and A. Tighten coupling nuts fingertight.

R (4) Tighten nut on two clamps securing PS and P2 tube assemblies to bracket. Torque nut to 20 - 25 lb-in. (2.26 - 2.82 N.m).

R (5) Torque the coupling nuts on PS (AS17) tube assembly to 270 - 300 lb-in. (30.51 - 33.90 N.m).

R (6) Torque the coupling nuts on P2 (AS16) tube assembly to 135 - 150 lb-in. (15.253 - 16.948 N.m).

POWER PLANT GENERAL − FAN CASE − INSTALLATION−25

Task 71−00−33−450−041:

1. Install Barometric Switch

   A. Equipment And Materials Required − None

   B. Procedure

   See Figure 401.

   (1) Mount the barometric switch (5) onto the bracket (10) the screws (15), washers (20) and nuts (25). Torque the nuts to 20 − 25 lb−in. (2.3 − 2.8 N.m).

   (2) Install the bracket with the barometric switch attached to the forward side of engine flange B1 at holes 23 and 24 with the screws (30), washers (35) and nuts (40). Torque the nuts to 50 − 70 lb−in. (5.7 − 7.9 N.m).

   (3) Install electrical connector DS308 to the barometric switch receptacle. Tighten the connector fingertight plus one−eighth turn.

POWER PLANT GENERAL − INTERMEDIATE CASE − REMOVAL−01

Task 71−00−34−050−001:

1. Remove Engine Forward Mount
   - A. Equipment And Materials Required − None
   - B. Procedure

     See Figure 301.
     - (1) Remove bolt, washers and nut securing two retainer assemblies to secondary retainer.
     - (2) Remove bolts and washers securing secondary retainer assembly to forward support.
     - (3) Remove nuts, washers, bolts and retainers from two (2) sets of fasteners attaching forward mount to engine support clevis assembly.
     - (4) Remove two (2) bolts, washers and nuts attaching thrust struts to engine support clevis assemblies.
     - (5) Remove mount from engine.

       NOTE: For additional information concerning detailed maintenance of the component, see Forward Engine Mount Component Maintenance Manual, 71−20−04 (P&W PN 221−4049).

POWER PLANT GENERAL − INTERMEDIATE CASE − REMOVAL−02

Task 71−00−34−050−007:

1. Remove Circumferential Latch Supports

A. Equipment And Materials Required − None

B. Procedure

See Figure 301.

(1) At top of fan case, remove bolts, washers, spacers, and shims attaching upper support assembly to fan case.

(2) At bottom of fan case, remove bolts, washers, spacers, and shims attaching lower support assembly to engine case.

NOTE: Identify shim location on shim and retain for re−installation.

(3) Remove upper and lower support assemblies from engine.

POWER PLANT GENERAL - INTERMEDIATE CASE - INSTALLATION-01

Task 71-00-34-450-001:

1. Install Engine Forward Mount

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P06-020	Lubricant, Bolt
P09-001	Sealant, Silicone (DC 90-006)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Lockwire, MS20995C32				

B. Procedure

See Figure 401.

(1) Position mount (401/1) on engine.

(2) Apply Lubricant (P06-020) to shank and threads of bolt (401/2).

NOTE: Prior to re-installation of (Post SB PW4NAC 71-111) forward mounts, ensure residual sealant is removed from engine support clevis assembly, bottom retainer assembly (401/3), nut (401/5) and washer (401/4). For additional information concerning detailed removal of sealant from these parts, see Forward Engine Mount Component Maintenance Manual, 71-20-04, Page Block 700 (P&W PN 221-4049).

(3) Install center retainers (401/3), two bolts (401/2), washers (401/4) both sides of washers wet with Sealant (P09-001) (Post SB PW4NAC 71-111), and nuts (401/5) attaching thrust struts to engine support clevis assemblies.

(a) During installation, observe run on torque required to turn nuts (401/5) on bolts (401/2) until a minimum of two bolt threads extend beyond nuts. Check that run-on torque is between 18 - 100 lb-in. (2.034 - 11.298 N.m) with no axial loads applied.

(b) Replace any nuts not meeting specified run-on torque value and repeat check.

(4) Position forward mount assembly (401/1) on engine compressor intermediate case aft flange.

Engine Forward Mount Installation
Figure 401
(Task 71−00−34−450−001)

POWER PLANT GENERAL − INTERMEDIATE CASE − INSTALLATION−01

- (a) Install mount assembly with four bolts (401/6), four washers (401/7), and retainer assemblies (401/8). Position retainers under boltheads. Torque bolts (401/6) to 180 − 220 lb−ft. (244.0 − 298.3 N.m).
- (b) Install two retainers (401/9) onto each pair of bolts (401/6) with bolt (401/10), two washers (401/11), and nut (401/12). Torque nut to 20 − 25 lb−in. (2.259 − 2.825 N.m).

(5) Torque bolts (401/2) to 250 − 300 lb−in. (28.246 − 33.895 N.m).

(6) Position top retainer (401/3) over bolt (401/2) and wet install bottom retainer (401/3) over nut (401/5) with Sealant (P09−001) on clevis mating surface of bottom retainer (Post SB PW4NAC 71−111), and install bolt (401/13), washer (401/14), and nut (401/15).

- (a) During installation, observe run−on torque required to turn nuts (401/15) on bolts (401/13) until a minimum of two bolt threads extend beyond nuts. Check that run−on torque is between 2 − 10 lb−in. (0.226 − 1.130 N.m).
- (b) Replace any nuts not meeting specified run−on torque value and repeat check.

(7) Torque nuts (401/15) to 20 − 25 lb−in. (2.260 − 2.825 N.m).

POWER PLANT GENERAL - INTERMEDIATE CASE - INSTALLATION-02

Task 71-00-34-450-007:

1. Install Circumferential Latch Supports

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P18-001	Primer, Epoxy Polyamide (MIL-P-23377)

B. Procedure

See Figure 401.

(1) On top of fan case, position upper support assembly and peel shims to obtain net fit between upper support assembly and spacer prior to installing bolts.

(2) Lubricate bolts with Oil (P03-001), and coat spacers with Primer (P18-001).

(3) Install upper support assembly and lower support assembly with bolts, washers, shims, and spacers. Torque bolts 35 - 40 lb-in. (3.954 - 4.519 N.m).

(4) At bottom of fan case, position lower support assembly and peel shims to obtain net fit between lower support assembly and spacer prior to installing bolts.

(5) Lubricate bolts with Oil (P03-001), and coat spacers with Primer (P18-001).

(6) Install lower support assembly with bolts, washers, shims, and spacers. Torque bolts 35 - 40 lb-in. (3.954 - 4.519 N.m).

POWER PLANT GENERAL − HIGH PRESSURE COMPRESSOR (HPC) − REMOVAL−01

Task 71−00−35−050−001:

1. Remove Engine Core Wiring Harness − Pre SB PW4NAC 71−70, 71−80, 71−107
   - A. Equipment And Material Required − None
   - B. Procedure

     See Figure 301.

     NOTE: Procedural steps (1) through (30) remove wire harnesses 21W4070, 21W4072 and 21W4114 from left side of engine core, Figure 301.

     (1) Remove terminal cover with attaching hardware from terminal block on IDG.
     (2) Remove four nuts and washers from terminal studs. Remove power cables 070002−00N, 070003−00A, 070004−00B and 070005−00C from IDG terminal block.
     (3) Install terminal cover on IDG with screws and washers.
     (4) Disconnect connectors DG13A and DG13B from IDG. Install protective covers.
     (5) Remove harness support with four clamps and attaching hardware.
     (6) Remove support bracket with clamp guide and two clamps and attaching hardware.
     (7) Remove support bracket with clamp guide and two clamps and attaching hardware.
     (8) Remove support bracket with ground studs 070001−00N and 070002−00N and attaching hardware.
     (9) Disconnect electrical connector DV213 from disconnect valve. Install protective covers.
     (10) Disconnect connector DT582 from oil temperature sensor. Install protective covers.
     (11) Disconnect connector DS299 from oil filter differential pressure switch. Install protective covers.
     (12) Disconnect electrical connector DS297 from low oil pressure switch. Install protective covers.
     (13) Remove two clamps (301/1) with attaching hardware.
     (14) Remove four clamps (301/2) with attaching hardware.
     (15) Disconnect electrical connector DT583 from oil pressure transmitter. Install protective covers.
     (16) Remove clamps (301/3) through (301/8) with attaching hardware.
     (17) Disconnect electrical connector DT584 from oil quantity transmitter. Install protective covers.
     (18) Disconnect electrical connectors DV225A thru DV225C from high pressure bleed control valve. Install protective covers.
     (19) Remove clamp (301/9) and clampshell (301/10) with attaching hardware.
     (20) Remove clamp (301/11) with attaching hardware.

(21) Remove clamp (301/12) and spacer with attaching hardware.
(22) Remove four clamp supports (301/13) and attaching hardware from existing brackets.
(23) Disconnect IDG wire harness 21W4114 electrical connector D4955P from pylon generator wire harness receptacle. Install protective covers.
(24) Disconnect electrical connectors DV224A and DV224B from pneumatic regulator. Install protective covers.
(25) Remove clamps (301/14) and clampshells (301/15) and attaching hardware from tubing bracket.
(26) Remove two nuts, washers and contacts 1387−3 and 1387−4 from high−stage temperature sensor terminals. Reinstall nuts and washers on terminals.
(27) Remove two clamps (301/16) and attaching hardware.
(28) Remove three clamps (301/17) and clampshells (301/18) with attaching hardware from tubing bracket.
(29) Remove five clamps (301/19) and attaching hardware.
(30) Disconnect electrical plugs D4954P and D4958P from pylon interface panel receptacles. Install protective covers.

NOTE: Procedural steps (31) through (71) remove wire harness 21W4072 from right side of engine core, Figure 302.

(31) Disconnect connector DT579 from No. 3 bearing oil temperature sensor. Install protective covers.
(32) Disconnect electrical connector DV215 from starter shutoff valve. Install protective covers.
(33) Remove clamp (302/1) with attaching hardware from starter shutoff valve cover.
(34) Remove three clamps (302/1) and attaching hardware from starter shutoff valve cover.
(35) Remove clamp (302/1) and attaching hardware from end of drain filter support bracket.
(36) Remove three clamps (302/1) and spacers (302/2) and attaching hardware from drain filter support bracket.
(37) Disconnect connector DV214 from hydraulic pump. Install protective covers.
(38) Remove clamp (302/3) with attaching hardware from existing support bracket on hydraulic pump.
(39) Remove clamp (302/4) with attaching hardware from existing support bracket.
(40) Remove clamp (302/5) with attaching hardware from stator vane actuator support bracket.
(41) Remove clamp (302/6) with attaching hardware from tube support bracket.
(42) Remove clamp (302/7) and clampshell with attaching hardware from tube support bracket.

(43) Remove two clamps (302/8) with attaching hardware from stator vane actuator support bracket.
(44) Disconnect electrical connector DV216 from IDG AOC valve. Install protective covers.
(45) Disconnect connector DT581 from fuel pressure transmitter. Install protective covers.
(46) Disconnect electrical connector DT595 from core compartment temperature sensor. Install protective covers.
(47) Remove clamp (302/9) with attaching hardware from fuel pressure transmitter support bracket.
(48) Remove two clamps (302/10) with attaching hardware from tube support bracket.
(49) Disconnect connector DH10 from fuel condition actuator. Install protective covers.
(50) Remove clamp (302/11) with attaching hardware from tube support bracket.
(51) Remove clamp (302/12) with attaching hardware from fuel condition actuator support bracket.
(52) Remove clamp (302/13) and clampshell (302/14) with attaching hardware from tube support bracket.
(53) Remove clamp (302/15) with attaching hardware from tube support bracket.
(54) Disconnect connector D4991P from fuel pump. Install protective covers.
(55) Disconnect connector DT580 from fuel flow transmitter. Install protective covers.
(56) Remove clamps (302/16) and (302/17) with attaching hardware from fuel flow transmitter support bracket.
(57) Remove two clamps (302/18) with attaching hardware from drain filters support bracket.
(58) Remove hardware attaching clamp (302/19) and support bracket (302/20) to drain filters support bracket.
(59) Remove clamp (302/21) and attaching hardware from support bracket.
(60) Remove hardware attaching support bracket (302/22) with clamp (302/23) to drain filter support.
(61) Disconnect electrical connector DH8 from ignitor exciter. Install protective covers.
(62) Disconnect electrical connector DH7 from engine exciter. Install protective covers.
(63) Remove three clamps (302/24) with attaching hardware from existing brackets.
(64) Remove clamp (302/25) with attaching hardware from existing bracket.
(65) Remove clamp (302/26) and attaching hardware from TCC bellows flange bracket.
(66) Remove clamp (302/27) and attaching hardware from support bracket on Flange J.

(67) Disconnect ground connections (302/28) from ground connection support bracket.
(68) Remove three clamps (302/29) and attaching hardware from existing brackets.
(69) Remove clamp (302/30) and clampshell (302/31) and attaching hardware from existing bracket.
(70) Disconnect electrical connector DS298 from IDG AOC pressure switch. Install protective covers.
(71) Disconnect electrical plugs D4952P, D4956P and D4961P from pylon interface panel receptacles. Install protective covers.

Task 71−00−35−050−001−A:

2. Remove Engine Core Wiring Harness − Post SB PW4NAC 71−70, 71−80, 71−107

A. Equipment And Material Required − None

B. Procedure

See Figure 303.

NOTE: Procedural steps (1) through (30) remove wire harnesses 21W4070, 21W4072 and 21W4114 from left side of engine core, Figure 303.

(1) Remove terminal cover with attaching hardware from terminal block on IDG.

(2) Remove four nuts and washers from terminal studs. Remove power cables 070002−00N, 070003−00A, 070004−00B and 070005−00C from IDG terminal block.

(3) Install terminal cover on IDG with screws and washers.

(4) Disconnect connectors DG13A and DG13B from IDG. Install protective covers.

(5) Remove two clamps and attaching hardware securing harness to tube and terminal cover (Post SB PW4NAC 71−107).

(6) Remove support bracket with clamp guide and two clamps and attaching hardware.

(7) Remove support bracket with clamp guide and two clamps and attaching hardware.

(8) Remove support bracket with ground studs 070001−00N and 070002−00N and attaching hardware.

(9) Disconnect electrical connector DV214 from disconnect valve. Install protective covers (Post SB PW4NAC 71−70).

(10) Disconnect connector DT582 from oil temperature sensor. Install protective covers.

(11) Disconnect connector DS299 from oil filter differential pressure switch. Install protective covers.

(12) Disconnect electrical connector DS297 from low oil pressure switch. Install protective covers.

(13) Remove two clamps (303/1) with attaching hardware.

(14) Remove six clamps (303/2) with attaching hardware (Post SB PW4NAC 71−80 rerouting of harnesses).

(15) Disconnect electrical connector DT583 from oil pressure transmitter. Install protective covers.

(16) Remove clamps (303/3) through (303/8) with attaching hardware.

(17) Disconnect electrical connector DT584 from oil quantity transmitter. Install protective covers.

(18) Disconnect electrical connectors DV225A through DV225C from high pressure bleed control valve. Install protective covers.

(19) Remove clamp (303/9) and clampshell (303/10) with attaching hardware.
(20) Remove clamp (303/11) with attaching hardware.
(21) Remove three clamps (303/12) and spacers (303/13) with attaching hardware.
(22) Remove four clamp supports (303/14) and attaching hardware from existing brackets.
(23) Disconnect IDG wire harness 21W4114 electrical connector D4955P from pylon generator wire harness receptacle. Install protective covers.
(24) Disconnect electrical connectors DV224A and DV224B from pneumatic regulator. Install protective covers.
(25) Remove clamps (303/15) and clampshells (303/16) and attaching hardware from tubing bracket.
(26) Remove two nuts, washers and contacts 1387−3 and 1387−4 from high−stage temperature sensor terminals. Reinstall nuts and washers on terminals.
(27) Remove three clamps (303/17) and attaching hardware.
(28) Remove three clamps (303/18) and clampshells (303/19) with attaching hardware from tubing bracket.
(29) Remove five clamps (303/20) and attaching hardware.
(30) Disconnect electrical plugs D4954P and D4958P from pylon interface panel receptacles. Install protective covers.

NOTE: Procedural steps (31) through (69) remove wire harness 21W4072 from right side of engine core, Figure 304.

(31) Disconnect connector DT579 from No. 3 bearing oil temperature sensor. Install protective covers.
(32) Disconnect electrical connector DV215 from starter shutoff valve. Install protective covers.
(33) Remove three clamps (304/1) with attaching hardware securing harness to No. 4 bearing scavenge tube.
(34) Remove four clamps (304/2) and attaching hardware securing harness to gearbox scavenge tube.
(35) Remove clamp (304/3) and attaching hardware securing harness to standoff bracket on gearbox.
(36) Disconnect electrical connector DV213 from hydraulic pump. Install protective covers (Post SB PW4NAC 71−70).
(37) Remove clamp (304/4) with attaching hardware from existing support bracket on hydraulic pump.
(38) Remove clamp (304/5) with attaching hardware from existing support bracket.
(39) Remove clamp (304/6) with attaching hardware from stator vane actuator support bracket.
(40) Remove clamp (304/7) with attaching hardware from tube support bracket.

(41) Remove two clamps (304/8) with attaching hardware from tube support bracket.

(42) Remove two clamps (304/9) with attaching hardware from stator vane actuator support bracket.

(43) Disconnect electrical connector DT216 from IDG AOC valve. Install protective covers.

(44) Disconnect connector DT581 from fuel pressure transmitter. Install protective covers.

(45) Disconnect electrical connector DT595 from core compartment temperature sensor. Install protective covers.

(46) Remove two clamps (304/10) with attaching hardware from fuel pressure transmitter support bracket and support tube.

(47) Remove two clamps (304/11) with attaching hardware from tube support bracket.

(48) Disconnect connector DH10 from fuel condition actuator. Install protective covers.

(49) Remove clamp (304/12) with attaching hardware from tube support bracket.

(50) Remove clamp (304/13) with attaching hardware from fuel condition actuator support bracket.

(51) Remove clamp (304/14) and clampshell (304/15) with attaching hardware from tube support bracket.

(52) Remove clamp (304/16) with attaching hardware from tube support bracket.

(53) Disconnect electrical connector D4991P from fuel pump. Install protective covers.

(54) Disconnect electrical connector DT580 from fuel flow transmitter.

(55) Remove clamps (304/17) and (304/18) with attaching hardware from fuel flow transmitter support bracket.

(56) Remove clamp (304/19) with attaching hardware from support bracket.

(57) Remove clamp (304/20) and attaching hardware from support bracket.

(58) Remove hardware attaching support bracket (304/21) with clamp (304/22).

(59) Disconnect electrical connector DH8 from ignitor exciter. Install protective covers.

(60) Disconnect electrical connector DH7 from engine exciter. Install protective covers.

(61) Remove two clamps (304/23) with attaching hardware from existing brackets.

(62) Remove clamp (304/24) with attaching hardware from existing bracket.

(63) Remove clamp (304/25) and attaching hardware from TCC bellows flange bracket.

(64) Remove clamp (304/26) and attaching hardware from support bracket on Flange J.

(65) Disconnect five ground connectors (304/27) from ground connection support bracket.

(66) Remove four clamps (304/28) and attaching hardware from existing brackets.

(67) Remove three clamps (304/29) and clampshells (304/30) and attaching hardware from existing brackets.

(68) Disconnect electrical connector DS298 from IDG AOC pressure switch. Install protective covers.

(69) Disconnect electrical plugs D4952P, D4956P and D4961P from pylon interface panel receptacles. Install protective covers.

POWER PLANT GENERAL − HIGH PRESSURE COMPRESSOR (HPC) − REMOVAL−02

Task 71−00−35−050−002:

1. Remove High Pressure Bleed Control Valve
    - A. Equipment And Materials Required − None
    - B. Procedure

      See Figure 301.
        - (1) Remove couplings and metal seals attaching valve to midstage duct and high pressure manifold.
        - (2) Install protective covers over open valve and duct ports.
        - (3) Remove valve from engine core.

Task 71-00-35-050-003:

1. Remove Pressure Regulator Valve

A. Equipment And Materials Necessary - None

B. Procedure
See Figure 301.

R CAUTION: BE CAREFUL WHEN YOU HANDLE, REMOVE OR INSTALL
R ALL TUBES WHICH CONTAIN A FLEX DESIGN
R SEGMENT. REMOVE AND INSTALL A TUBE WITH A
R FLEX SEGMENT WITH THE SAME PRECAUTIONS
R USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO
R NOT BEND THE FLEXHOSE OF A TUBE TO HELP
R WITH THE INSTALLATION OR REMOVAL OF AN
R ATTACHED COMPONENT. IF A FLEX SEGMENT IS
R BENT TOO MUCH, THIS CAN CAUSE A KINK IN
R THE EXTERNAL WIRE BRAID AND IN THE INNER
R POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS
R OR TUBE RUPTURE CAN BE THE RESULT.

(1) Remove couplings and seals attaching valve to manifold duct and interface duct.

(2) Install protective covers over open valve and duct ports.

(3) Remove valve from engine core.

Task 71-00-35-050-009:

1. Remove 2.95 Bleed Valve Bellows

   A. Equipment And Materials Required - None

   B. Procedure

      See Figure 301.

      (1) Remove screws and washers securing bellows and brackets to valve.

      (2) Install protective cover on bleed valve port.

Task 71-00-35-050-010:

1. Remove Fire Extinguisher Tubes

A. Equipment And Materials Required - None

B. Procedure

See Figure 301.

(1) Disconnect pylon hose from elbow at upper bracket on Flange K.

(2) Loosen fire extinguisher tube coupling nuts on both ends of tube assembly.

(3) Remove clamps, bolts, washers, and nuts attaching upper fire extinguisher tube to two support brackets.

(4) Disconnect upper fire extinguisher tube from two elbows.

(5) Remove elbow, washer, and nut from bracket mounted on Flange J.

(6) Remove elbow from upper end of fire extinguisher tube.

(7) Remove two clamps, bolt, washer, and nut securing lower fire extinguisher tube to bracket shared with IDG oil tube.

(8) Remove clamp, bolt, washer, and nut securing lower fire extinguisher tube to support bracket.

Task 71-00-35-050-011:

1. Remove IDG Cooling Tubes

A. Equipment And Materials Required - None

B. Procedure

See Figure 301.

(1) Disconnect coupling nuts of tube (6) from IDG oil in union and from tube (5). Remove union and discard packing.

(2) Remove clamp, bolt, washer, and nut attaching tube (6) to tube (5). Remove tube (6) from engine.

(3) Disconnect coupling nut of tube (5) from IDG fuel/oil cooler oil out union. Remove union and discard packing.

(4) Remove clamp, bolt, washer, and nut attaching tube (5) to bracket. Remove tube (5) from engine.

(5) Disconnect coupling nuts of tube (4) from IDG scavenge filter oil out reducer and from tube (3). Remove reducer and discard packing.

(6) Remove tube (4) from engine.

(7) Disconnect coupling nut of tube (3) from tube (2).

(8) Remove clamp, bolt, washer, and nut attaching tube (3) to bracket. Remove tube (3) from engine.

(9) Disconnect coupling nut of tube (2) from tube (1).

(10) Remove clamp, bolt, washer, and nut attaching tube (2) to bracket. Remove tube (2) from engine.

(11) Disconnect coupling nut of tube (1) from union on IDG oil in port. Remove union and discard packing.

(12) Remove tube (1) from engine.

POWER PLANT GENERAL - HIGH PRESSURE COMPRESSOR (HPC) - REMOVAL-07

Task 71-00-35-050-012:

1. Remove Bleed Air Pneumatic Tubes And Hoses

A. Equipment And Materials Required - None

B. Procedure

See Figure 301.

(1) Disconnect three hoses (301/21, 301/22, 301/23) from pylon interface.

(2) Disconnect hose (301/23) from upper left elbow on bracket, at Flange M.

(3) Disconnect hose (301/22) from upper right elbow on bracket, at Flange M.

(4) Disconnect hose (301/21) from lower elbow of bracket, at Flange M.

(5) Disconnect clamp, bolt, washer, and nut attaching tube (301/11) to support bracket on left side of 2.9 bleed bellows.

(6) Disconnect clamp, bolt, washer, and nut attaching tube (301/12) to upper support bracket on left side of 2.9 bleed bellows.

(7) Disconnect clamps, bolts, washers, and nuts attaching tube (301/15) to two support bracket on left side of 2.9 bleed bellows.

(8) Disconnect clamp, bolt, washer, and nut attaching tube (301/9) to forward support bracket on starter upper duct.

(9) Disconnect clamps, washers, and bolts securing tubes (301/12, 301/13) to forward support bracket on starter upper duct.

(10) Disconnect clamp, washer, and bolt securing tube (301/9) to aft bracket on starter upper duct.

(11) Disconnect clamps, washers, and bolts securing tubes (301/12, 301/13) to aft bracket on starter upper duct.

(12) Disconnect tube (301/15) from union and pneumatic regulating valve.

(13) Disconnect tube (301/13) from upper left elbow on bracket, at Flange M. Remove union from tube.

(14) Disconnect tube (301/12) from lower elbow on bracket at Flange M and from reducer on mid−stage duct.

(15) Disconnect tube (301/11) from reducer and from union.

(16) Disconnect tube (301/9) from upper right elbow on bracket at Flange M. Remove reducer from tube.

(17) Remove reducer from mid−stage duct.

(18) Remove washers and nuts securing three elbows to bracket at Flange M.

Task 71-00-35-050-013:

1. Remove TRC Valve Cooling Tube

   A. Equipment And Materials Required - None

   B. Procedure

   See Figure 301.

   (1) Disconnect clamps securing flex hose (301/8) to cooling tube (301/2) and TBVCA valve. Remove flex hose.

   (2) Loosen coupling nuts at both ends of cooling tube (301/2).

   (3) Release snap retainer of connector body securing TRC valve cooling tube to TRC valve. Retain loose hardware of connector body.

   (4) Disconnect clamp, screw, washer, and nut securing cooling tube (301/2) to bracket.

   (5) Remove cooling tube (301/2) from engine.

POWER PLANT GENERAL - HIGH PRESSURE COMPRESSOR (HPC) - REMOVAL-09

Task 71-00-35-050-014:

1. Remove Oil System Tubes

   A. Equipment And Materials Required - None

   B. Procedure

      See Figure 301.

      (1) Disconnect clamp, screw, washer, and nut securing oil tube (301/18) to engine bracket.

      (2) Disconnect clamps, screw, washer, and nut securing oil tubes (301/18) and (301/19) to bracket.

      (3) Loosen and disconnect coupling nuts of oil tube (301/19) from restrictor in LP4 port and union of oil filter differential pressure switch.

      (4) Loosen and disconnect coupling nuts of oil tube (301/18) from restrictor in LP5 port and union of oil filter differential pressure switch.

      (5) Remove two bolts securing bracket on oil cooler bypass valve.

      (6) Disconnect two clamps, bolt, washer, and nut securing hose assembly to oil tube.

      (7) Disconnect clamps, spacer, bolt, washer, and nut securing oil tubes (301/14) and (301/13) together.

      (8) Loosen and disconnect coupling nuts of oil tube (301/14) from tee in top of oil pressure transmitter and union in bottom of low oil pressure warning switch. Remove oil tube from engine.

      (9) Loosen and disconnect coupling nuts of oil hose/tube (301/12) from tee in oil tube support bracket and union of low oil pressure warning switch. Remove oil tube from engine.

      (10) Disconnect coupling nuts of hose assembly from tee in oil tube support bracket and union in bottom of oil pressure transmitter.

      (11) Disconnect clamp, screw, washer, and nut securing oil tube (301/9) to engine drain tube.

(12) Loosen and disconnect coupling nuts of oil tube (301/9) from reducer in LP1 port and tee in oil tube support bracket. Remove oil tube from engine.

(13) Remove washer and nut securing tee in oil tube support bracket.

(14) Disconnect clamps, screws, washers, and nuts securing oil tube (301/1) to bracket.

(15) Loosen and disconnect coupling nuts of oil tube (301/1) from union in LB6 port and tee in oil pressure transmitter. Remove oil tube from engine.

(Task 71-00-35-050-014)

POWER PLANT GENERAL - HIGH PRESSURE COMPRESSOR (HPC) - INSTALLATION-01

Task 71-00-35-450-001:

1. Install Engine Core Wiring Harness - Pre SB PW4NAC 71-70, 71-80, 71-107

A. Equipment And Materials Necessary

Standard Tools:
Glenair TG-69 Soft Jawed Pliers Or
Glenair TG-70 Strap Wrench

Consumable Materials:

Item No.	Designation
P11-009	Alcohol, Denatured Ethyl (AMS 3002)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Lockwire, MS20995C32		

B. Procedure
See Figure 401.

NOTE: Procedural steps (1) through (40) install wire harness 21W4072 on right side of engine core, Figure 401.

(1) Position wire harness 21W4072 under pylon interface panel with electrical connectors D4952P, D4956P and D4961P closest to panel.

(2) At pylon interface panel, remove protective covers from electrical plugs and receptacles for D4952P, D4956P and D4961P.

(3) Connect electrical plugs D4952P, D4956P and D4961P to receptacles. Tighten connector fingertight plus one-eighth turn. Lockwire connector.

(4) Install three clamps (401/1) and attaching hardware on support brackets. Torque nuts to 32 - 36 lb-in. (3.616 - 4.067 N.m).

(5) Connect electrical connector DS298 to IDG AOC pressure switch as follows.

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(6) Install two clamps (401/2) and clamp shells (401/3) and attaching hardware on existing bracket. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(7) At ground connection support bracket (401/4), remove five nuts and washers from five ground studs (401/5). Install five ground connections, washers, and nuts on ground studs. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(8) Install clamp (401/6) and attaching hardware on support bracket in Flange J. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(9) Install clamp (401/7) and attaching hardware on TCC bellows flange. Torque nuts to 32 − 36 lb−in (3.616 − 4.067 N.m).

(10) Install three clamps (401/8) and attaching hardware on support brackets. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(11) Install clamp (401/9) and attaching parts on existing bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(12) Install support bracket (401/10) with clamp (401/11) and attaching hardware on drain filter support. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(13) Connect electrical connector DH7 to engine exciter. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(14) Connect electrical connector DH8 to igniter exciter. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(15) Install two clamps (401/12) and attaching hardware on drain filters support bracket. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(16) Install clamp (401/13) and attaching parts on existing bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(17) Install support bracket (401/14) with clamp (401/15) and attaching hardware on drain filter support. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

POWER PLANT GENERAL − HIGH PRESSURE COMPRESSOR (HPC) − INSTALLATION−01

(18) Install clamp (401/16) with attaching hardware on fuel flow transmitter support bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(19) Install clamp (401/17) with attaching hardware on fuel flow transmitter support bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(20) Connect electrical connector DT580 to fuel flow transmitter. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(21) Connect electrical connector D4991P to fuel pump. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(22) Install clamp (401/18) with attaching hardware on tube support bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(23) Install clamp (401/19) and clamp shell (401/20) with attaching hardware on tube support bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(24) Install clamp (401/21) with attaching hardware on tube support bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(25) Install clamp (401/22) with attaching hardware on fuel condition actuator support bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(26) Connect electrical connector DH10 to fuel condition actuator. Tighten connector as follows.

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

R
R

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(27) Install two clamps (401/23) with attaching hardware on tube support bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(28) Install clamp (401/24) with attaching hardware on fuel pressure transmitter support bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(29) Connect electrical connector DT595 to core compartment temperature sensor. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(30) Connect electrical connector DT581 to fuel pressure transmitter. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(31) Connect electrical connector DV216 to IDG AOC valve. Tighten connector as follows.

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:

- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(32) Install clamp (401/25) and clamp shell (401/26) with attaching hardware on tube support bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(33) Install clamp (401/27) with attaching hardware on stator vane actuator support bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(34) Install clamp (401/28) with attaching hardware on tube support bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(35) Install two clamps (401/29) with attaching hardware on stator vane actuator support brackets. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(36) Install three clamps (401/30) with spacers (401/31) and attaching hardware on drain filters support bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(37) Install three clamps (401/30) with attaching hardware on three support brackets on starter shutoff valve cover. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(38) Install clamps (401/32) and (401/33) with attaching hardware on support brackets. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(39) Connect electrical connector DV215 to starter shutoff valve. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(40) Connect electrical connector DT579 to No. 3 bearing oil temperature sensor. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

NOTE: Procedural steps (41) through (72) install wire harnesses 21W4070, 21W4072 and 21W4114 on left side of engine core, Figure 402.

(41) Position wire harness 21W4114 under pylon interface panel with electrical connectors D4954P and D4958P closest to panel.

(42) At pylon interface panel, remove protective covers from electrical plugs and receptacles for D4954P and D4958P.

(43) Connect electrical plugs D4954P and D4958P to receptacles. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(44) At base of pylon interface panel, remove protective covers from electrical plug D4955P and receptacle (402/1) for pylon generator wire harness. Connect plug to receptacle and tighten plug fingertight plus one−eighth turn. Lockwire plug.

(45) Install five clamps (402/2) on existing brackets with attaching hardware. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(46) At ground cables support bracket (402/3), remove five nuts and washers from five ground studs (402/4). Install ground connections, washers, and nuts on ground studs. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(47) Install three clamps (402/5) and clamp shells (402/6) on tubing bracket with attaching hardware. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(48) Install two clamps (402/7) and attaching hardware on support brackets. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(49) Remove two nuts and washers from high−stage temperature sensor terminals. Install terminal lugs, 1387−3 (yellow) on Post C and 1387−4 (red) on Post A, with removed nuts and washers. Torque nut for 1387−3 to 20 − 22 lb−in. (2.260 − 2.486 N.m), nut for 1387−4 to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(50) Install clamps (402/8) and clamp shells (402/9) on tubing bracket with attaching hardware. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(51) Connect electrical connectors DV224A and DV224B to pneumatic regulator. Tighten connectors fingertight plus one−eighth turn. Lockwire connectors.

(52) Connect IDG wire harness 21W4114 electrical connector D4955P to pylon generator wire harness. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(53) Install four clamp supports (402/10) to existing brackets with attaching hardware. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(54) Install clamp (402/11) and spacer (402/12) with attaching hardware. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(55) Install clamp (402/13) with attaching hardware on support bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(56) Install clamp (402/14) and clamp shell (402/15) with attaching hardware. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(57) Connect electrical connectors DV255A thru DV255C to high pressure bleed control valve. Tighten connectors fingertight plus one−eighth turn. Lockwire connectors.

(58) Install clamps (402/16) thru (402/21) and attaching hardware on support brackets. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(59) Connect electrical connector DT584 to oil quantity transmitter. Tighten connector as follows.

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(60) Connect electrical connector DT583 to oil pressure transmitter. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(61) Install four clamps (402/22) with attaching hardware. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(62) Install two clamps (402/23) with attaching hardware. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(63) Connect electrical connector DS297 to low oil pressure switch. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(64) Connect electrical connector DS299 to oil filter differential pressure switch. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(65) Connect electrical connector DT582 to oil temperature sensor. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(66) Connect electrical connector DV213 to disconnect valve. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(67) Install support bracket (402/24) with ground studs 070001−00N and 070002−00N and attaching hardware on Flange H. Torque nuts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(68) Install support bracket (402/25) with clamp guide and two clamps and attaching hardware. Torque bolts to 75 − 85 lb−in. (8.474 − 9.604 N.m).

(69) Install support bracket (402/26) with cable guide bracket and three clamps and attaching hardware. Torque bolts to 75 − 85 lb−in. (8.474 − 9.604 N.m).

(70) Install harness support (402/27) with four clamps and attaching hardware. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(71) Connect electrical connectors DS13A and DS13B to IDG. Tighten connectors fingertight plus one−eighth turn. Lockwire connectors.

(72) Remove terminal cover (402/28) with attaching hardware from terminal block on IDG.

R (73) Connect power cables 070002−00N, 070003−00A, 070004−00B
R and 070005−00C to terminal block studs with nuts and
R washers or nuts with captive washers. Torque nuts to
R 144 − 186 lb−in. (16.270 − 21.015 N.m).

(74) Install terminal cover (402/28) on IDG with screws and washers. Torque screws to 20 − 22 lb−in. (2.260 − 2.486 N.m).

Task 71−00−35−450−001−A:

POWER PLANT GENERAL − HIGH PRESSURE COMPRESSOR (HPC) − INSTALLATION−01

Standard Tools:
Glenair TG−69 Soft Jawed Pliers Or
Glenair TG−70 Strap Wrench

Consumable Materials:

Item No.	Designation
P11−009	Alcohol, Denatured Ethyl (AMS 3002)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Lockwire, MS20995C32		

B. Procedure
See Figure 403.

NOTE: Procedural steps (1) through (41) install wire harness 21W4072 on right side of engine core, Figure 403.

(1) Position wire harness 21W4072 under pylon interface panel with electrical connectors D4952P, D4956P and D4961P closest to panel.

(2) At pylon interface panel, remove protective covers from electrical plugs and receptacles for D4952P, D4956P and D4961P.

(3) Connect electrical plugs D4952P, D4956P and D4961P to receptacles. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(4) Install four clamps (403/1) and attaching hardware on support brackets. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(5) Connect electrical connector DS298 to IDG AOC pressure switch as follows.

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(6) Install three clamps (403/2) and clamp shells (403/3) and attaching hardware on existing bracket. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(7) Install clamp (403/4) using existing hardware on support tube.

(8) At ground connection support bracket (403/5), remove five nuts and washers from five ground studs (403/6). Install five ground connections, washers, and nuts on ground studs. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(9) Install clamp (403/7) and attaching hardware on support bracket in Flange J. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(10) Install clamp (403/8) and attaching hardware on TCC bellows flange. Torque nuts to 32 − 36 lb−in (3.616 − 4.067 N.m).

(11) Install two clamps (403/9) and attaching hardware on support brackets. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(12) Install two clamps (403/10) and attaching parts on existing bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(13) Install support bracket (403/11) with clamp (403/12) and attaching hardware on drain filter support. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(14) Connect electrical connector DH7 to engine exciter. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(15) Connect electrical connector DH8 to igniter exciter. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(16) Install clamp (403/13) and attaching hardware on drain filters support bracket. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(17) Install clamp (403/14) and attaching parts on existing bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(18) Install clamp (403/15) with attaching hardware on fuel flow transmitter support bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(19) Install clamp (403/16) with attaching hardware on fuel flow transmitter support bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(20) Connect electrical connector DT580 to fuel flow transmitter. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(21) Connect electrical connector D4991P to fuel pump. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(22) Install clamp (403/17) with attaching hardware on tube support bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(23) Install clamp (403/18) and clamp shell (403/19) with attaching hardware on tube support bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(24) Install clamp (403/20) with attaching hardware on tube support bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(25) Install clamp (403/21) with attaching hardware on fuel condition actuator support bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(26) Connect electrical connector DH10 to fuel condition actuator. Tighten connector as follows.

  (a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

  (b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

  NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(27) Install two clamps (403/22) with attaching hardware on tube support bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(28) Install clamp (403/23) with attaching hardware on fuel pressure transmitter support bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(29) Connect electrical connector DT595 to core compartment temperature sensor. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(30) Connect electrical connector DT581 to fuel pressure transmitter. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(31) Connect electrical connector DV216 to IDG AOC valve. Tighten connector as follows.

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(32) Install two clamps (403/24) and clampshells (403/25) with attaching hardware on tube support bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(33) Install clamp (403/26) with attaching hardware on stator vane actuator support bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(34) Install clamp (403/27) with attaching hardware on tube support bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(35) Install two clamps (403/28) with attaching hardware on stator vane actuator support brackets. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(36) Install four clamps (403/30) and attaching hardware to secure harness to gearbox scavenge tube. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(37) Install three clamps (403/29) with attaching hardware to secure harness to No. 4 bearing scavenge tube. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(38) Remove clamp (403/31) securing harness to standoff bracket on gearbox.

(39) Install clamps (403/32) and (403/33) with attaching hardware on support brackets. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(40) Connect electrical connector DV215 to starter shutoff valve. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(41) Connect electrical connector DT579 to No. 3 bearing oil temperature sensor. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

NOTE: Procedural steps (42) through (75) install wire harnesses 21W4070, 21W4072 and 21W4114 on left side of engine core, Figure 404.

(42) Position wire harness 21W4114 under pylon interface panel with electrical connectors D4954P and D4958P closest to panel.

(43) At pylon interface panel, remove protective covers from electrical plugs and receptacles for D4954P and D4958P.

(44) Connect electrical plugs D4954P and D4958P to receptacles. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(45) At base of pylon interface panel, remove protective covers from electrical plug D4955P and receptacle (404/1) for pylon generator wire harness. Connect plug to receptacle and tighten plug fingertight plus one−eighth turn. Lockwire plug.

(46) Install five clamps (404/2) on existing brackets with attaching hardware. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(47) At ground cables support bracket (404/3), remove five nuts and washers from five ground studs (404/4). Install ground connections, washers, and nuts on ground studs. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(48) Install three clamps (404/5) and clamp shells (404/6) on tubing bracket with attaching hardware. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(49) Install three clamps (404/7) and attaching hardware on support brackets. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(50) Remove two nuts and washers from high−stage temperature sensor terminals. Install terminal lugs, 1387−3 (yellow) on Post C and 1387−4 (red) on Post A, with removed nuts and washers. Torque nut for 1387−3 to 20 − 22 lb−in. (2.260 − 2.486 N.m), nut for 1387−4 to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(51) Install clamps (404/8) and clamp shells (404/9) on tubing bracket with attaching hardware. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(52) Connect electrical connectors DV224A and DV224B to pneumatic regulator. Tighten connectors fingertight plus one−eighth turn. Lockwire connectors.

(53) Connect IDG wire harness 21W4114 electrical connector D4955P to pylon generator wire harness. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(54) Install four clamp supports (404/10) to existing brackets with attaching hardware. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(55) Install three clamps (404/11) and spacers (404/12) with attaching hardware. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(56) Install clamp (404/13) with attaching hardware on support bracket. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(57) Install clamp (404/14) and clamp shell (404/15) with attaching hardware. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(58) Connect electrical connectors DV255A thru DV255C to high pressure bleed control valve. Tighten connectors fingertight plus one−eighth turn. Lockwire connectors.

(59) Install clamps (404/16) thru (404/21) and attaching hardware on support brackets. Torque nut to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(60) Connect electrical connector DT584 to oil quantity transmitter. Tighten connector as follows.

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND

CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(61) Connect electrical connector DT583 to oil pressure transmitter. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(62) Install four clamps (404/22) with attaching hardware. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(63) Install two clamps (404/23) with attaching hardware. Torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(64) Connect electrical connector DS297 to low oil pressure switch. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(65) Connect electrical connector DS299 to oil filter differential pressure switch. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(66) Connect electrical connector DT582 to oil temperature sensor. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

(67) Connect electrical connector DV213 to disconnect valve. Tighten connector fingertight plus one−eighth turn. Lockwire connector.

POWER PLANT GENERAL − HIGH PRESSURE COMPRESSOR (HPC) − INSTALLATION−01

(68) Install support bracket (404/24) with ground studs 070001−00N and 070002−00N and attaching hardware on Flange H. Torque nuts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(69) Install support bracket (404/25) with clamp guide and two clamps and attaching hardware. Torque bolts to 75 − 85 lb−in. (8.474 − 9.604 N.m).

(70) Install support bracket (404/26) with cable guide bracket and three clamps and attaching hardware. Torque bolts to 75 − 85 lb−in. (8.474 − 9.604 N.m).

(71) Install two clamps (404/29) and attaching hardware to secure harness to support tube and terminal cover.

(72) Connect electrical connectors DS13A and DS13B to IDG. Tighten connectors fingertight plus one−eighth turn. Lockwire connectors.

(73) Remove terminal cover (404/28) with attaching hardware from terminal block on IDG.

(74) Connect power cables 070002−00N, 070003−00A, 070004−00B and 070005−00C to terminal block studs with nuts and washers. Torque nuts to 145 − 155 lb−in. (16.383 − 17.513 N.m).

(75) Install terminal cover (404/28) on IDG with screws and washers. Torque screws to 20 − 22 lb−in. (2.260 − 2.486 N.m).

POWER PLANT GENERAL − HIGH PRESSURE COMPRESSOR (HPC) − INSTALLATION−02

Task 71−00−35−450−002:

1. Install High Pressure Bleed Control Valve
   A. Equipment And Materials Required

      Consumable Materials:

Item No.	Designation
P06−013	Lubricant, Solid Film

   B. Procedure
      See Figure 401.
      (1) Remove protective covers from high pressure valve, midstage duct and high pressure manifold.
      (2) Apply Material P06−013, to inner surfaces of couplings. Install couplings and metal seals on valve flanges.
      (3) Install valve between midstage duct and high pressure manifold with arrow pointing forward, 15 degrees inboard of centerline.
      (4) Orient valve so bracket on bottom of valve fits in slot formed by brackets of heat shield on end of 15th stage manifold. See Figure 402.
      (5) Torque couplings to value indicated on coupling bands.

POWER PLANT GENERAL - HIGH PRESSURE COMPRESSOR (HPC) - INSTALLATION-03

Task 71-00-35-450-003:

1. Install Pressure Regulator Valve

A. Equipment And Materials Necessary

Consumable Materials:

Item No.	Designation
P06-013	Lubricant, Solid Film

B. Procedure
See Figure 401.

R CAUTION: BE CAREFUL WHEN YOU HANDLE, REMOVE OR INSTALL ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTIONS USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE EXTERNAL WIRE BRAID AND IN THE INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(1) Remove protective covers from bleed valve, manifold duct and interface duct.

(2) Apply Lubricant P06-013, to inner surfaces of couplings. Install couplings and metal seals on valve flanges.

(3) Install valve between manifold duct and interface duct.

(4) Orient valve by setting the valve heat shield 11.20 inch (284.48 mm) from engine Flange J. See Figure 402.

(5) Torque couplings to value indicated on coupling bands.

C. Alternate Procedure
See Figure 403.

(1) Make a cardboard valve orientation template.

(2) Remove protective covers from bleed valve, manifold duct and interface duct. See Figure 401.

(3) Apply Lubricant P06−013, to inner surfaces of couplings. Install couplings and metal seals on valve flanges.

(4) Install valve between manifold duct and interface duct.

(5) Orient valve using template positioned on engine Flange J. See Figure 404.

(6) Torque couplings to value indicated on coupling bands.

POWER PLANT GENERAL – HIGH PRESSURE COMPRESSOR (HPC) – INSTALLATION-04

Task 71-00-35-450-009:

1. Install 2.95 Bleed Valve Bellows

A. Equipment And Materials Required – None

B. Procedure

See Figure 401.

(1) Remove protective cover from bleed valve port.

(2) Install bellows seal and brackets on bleed valve. Secure with bolts and washers. Torque bolts 50 – 70 lb-in. (5.65 – 7.91 N.m).

NOTE: Washers are required under boltheads to maintain minimum clearance of 0.030 inch (0.762 mm) between bolthead and bellows.

POWER PLANT GENERAL − HIGH PRESSURE COMPRESSOR (HPC) − INSTALLATION−05

Task 71−00−35−450−010:

1. Install Fire Extinguisher Tubes

A. Equipment And Materials Required − None

B. Procedure

See Figure 401.

(1) Attach lower fire extinguisher tube (401/1) to lower support bracket with clamp (401/2), bolt (401/3), washer (401/4), and nut (401/5).

(2) Install clamp (401/6) on integrated drive generator (IDG) oil tube and position at upper support bracket.

(3) Attach lower fire extinguisher tube to upper bracket with clamp (401/2), IDG oil tube clamp (401/6) on opposite side of bracket, bolt (401/3), washer (401/4), and nut (401/5). Torque nuts to 20 − 25 lb−in. (2.3 − 2.8 N.m).

(4) Install elbow (401/7) on upper end of lower fire extinguisher tube and tighten coupling fingertight.

(5) Install elbow (401/9), washer (401/10), and nut (401/11) on bracket mounted at Flange K. Tighten nut fingertight.

(6) Connect upper fire extinguisher tube (401/8) to two elbows (401/7, 401/9) and tighten couplings fingertight.

(7) Attach upper fire extinguisher tube (401/8) to two support brackets with clamps (401/2), bolts (401/3), washers (401/4), and nuts (401/5). Torque nuts to 20 − 25 lb−in. (2.3 − 2.8 N.m).

(8) Torque nut (401/11) and both fire extinguisher tube coupling nuts (at both elbows) to 215 − 240 lb−in. (24.3 − 27.1 N.m).

(9) Connect pylon hose (401/12) to elbow (401/9) at support bracket on Flange K. Torque hose coupling nut to 215 − 240 lb−in. (24.3 − 27.1 N.m).

POWER PLANT GENERAL - HIGH PRESSURE COMPRESSOR (HPC) - INSTALLATION-06

Task 71-00-35-450-011:

1. Install IDG Cooling Tubes

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIG.	ITEM
Packing	1	79-20-05	1	150A
Packing	1	79-20-05	1	160
Packing	1	79-20-05	1	170
Packing	1	79-20-05	1	180

B. Procedure

See Figure 401.

(1) At lower left side of engine case, install packing (401/1), lubricated with Engine Oil (P03-001), on union (401/2). Install union in IDG fuel/oil cooler oil out port. Torque union to 390 - 430 lb-in. (44.1 - 48.6 N.m).

(2) Install packing (401/3), lubricated with Engine Oil (P03-001), on reducer (401/4). Install reducer in IDG scavenge filter oil out port. Torque reducer to 360 - 400 lb-in. (40.7 - 45.2 N.m).

(3) Install packing (401/5), lubricated with Engine Oil (P03-001), on union (401/6). Install union in IDG oil in port. Torque union to 390 - 430 lb-in. (44.1 - 48.6 N.m).

(4) Install packing (401/8), lubricated with Engine Oil (P03-001), on sleeve of tube (401/7). Connect tube to air/oil cooler in port with washers and bolts. Tighten bolts fingertight.

(5) At lower right side of engine case, connect tube (401/7) to tube (401/11) and tighten coupling nut to 900 - 1000 lb-in. (101.7 - 113.0 N.m).

POWER PLANT GENERAL − HIGH PRESSURE COMPRESSOR (HPC) − INSTALLATION−06

(6) Attach tube (401/11) to two brackets using clamps (401/12), bolts (401/13), washers (401/14), and nuts (401/15). Tighten nuts fingertight.

(7) Torque bolts attaching tube (401/7) to air/oil cooler to 50 − 70 lb−in. (5.65 − 7.91 N.m).

(8) Connect tube (401/16) to tube (401/11) and tighten coupling nut fingertight.

(9) Attach tube (401/16) to two brackets using clamps (401/12), bolts (401/13), washers (401/14), and nuts (401/15). Tighten nuts fingertight.

(10) Torque coupling nut connecting tubes (401/11) and (401/16) to 900 − 1000 lb−in. (101.7 − 113.0 N.m).

(11) Connect tube (401/17) to tube (401/16) and IDG scavenge filter oil out reducer. Tighten coupling fingertight.

(12) Torque coupling nuts connecting tube (401/17) to IDG scavenge filter oil out reducer and to tube (401/16) to 900 − 1000 lb−in. (101.7 − 113.0 N.m).

(13) Connect tube (401/18) coupling nut to IDG fuel/oil cooler oil out union. Tighten coupling nut fingertight.

(14) Attach tube (401/18) to bracket with clamp (401/12), bolt (401/13), washer (401/19), and nut (401/15). Tighten nut fingertight.

(15) Torque tube (18) coupling nut to union to 900 − 1000 lb−in. (101.7 − 113.0 N.m).

(16) Connect tube (20) to tube (18) and IDG oil in union. Tighten coupling nuts fingertight.

(17) Attach tube (20) to tube (17) with clamp (401/12), bolt (401/13), washer (401/19), and nut (401/15). Torque nut to 20 − 25 lb−in. (2.26 − 2.82 N.m).

(18) Torque coupling nuts connecting tube (20) to IDG oil in union and to tube (18) to 900 − 1000 lb−in. (101.7 − 113.0 N.m).

Figure 401
(Task 71−00−35−450−011)

POWER PLANT GENERAL - HIGH PRESSURE COMPRESSOR (HPC) - INSTALLATION-07

Task 71-00-35-450-012:

1. Install Bleed Air Pneumatic Tubes And Hoses

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine

B. Procedure

See Figure 401.

(1) At Flange M, install two elbows (401/1) to bracket using washers (401/2) and nuts (401/3). Torque nuts to 120 - 130 lb-in. (13.6 - 14.7 N.m).

(2) At Flange M, install elbow (401/4) to bracket using washer (401/5) and nut (401/6). Torque nut to 125 - 140 lb-in. (14.1 - 15.8 N.m).

(3) Install union (401/7) in high-stage control valve and torque union to 120 - 130 lb-in. (13.6 - 14.7 N.m).

(4) Install reducer (401/8) in mid-stage duct and torque to 125 - 140 lb-in. (14.1 - 15.8 N.m).

(5) Connect tube (401/9) to upper right elbow (401/4) on bracket at Flange M. Torque coupling nut to 270 - 300 lb-in. (30.5 - 33.9 N.m).

(6) Install reducer (401/10) in tube (401/9) and torque coupling nut to 270 - 300 lb-in. (30.5 - 33.9 N.m).

(7) Connect tube (401/11) to reducer (401/10) and union (401/7). Torque coupling nuts of tube to 180 - 200 lb-in. (20.3 - 22.6 N.m).

(8) Connect tube (401/12) to lower elbow (401/1) on bracket at Flange M and to reducer (401/8) on mid-stage duct. Torque both coupling nuts to 180 - 200 lb-in. (20.3 - 22.6 N.m).

POWER PLANT GENERAL − HIGH PRESSURE COMPRESSOR (HPC) − INSTALLATION−07

(9) Connect tube (401/13) to upper left elbow (401/1) on bracket at Flange M and torque coupling nut to 180 − 200 lb−in. (20.3 − 22.6 N.m). Flange M and torque coupling nut to 180 − 200 lb−in. (20.3 − 22.6 N.m).

(10) Install union (401/14) in tube (401/13) and torque coupling nut to 180 − 200 lb−in. (20.3 − 22.6 N.m).

(11) Connect tube (401/15) to union (401/14) and to pneumatic regulating valve. Torque both coupling nuts to 180 − 200 lb−in. (20.3 − 22.6 N.m).

(12) Attach tubes (401/12 and 401/13) to aft bracket on starter upper duct using clamps (401/19), washers (401/18), and bolts (401/17). Torque bolts to 20 − 25 lb−in. (2.26 − 2.82 N.m).

(13) Attach tube (401/9) to aft bracket on starter upper duct using clamp (401/16), washer (401/18), and bolt (401/17). Torque bolt to 20 − 25 lb−in. (2.26 − 2.82 N.m).

(14) Attach tubes (401/12 and 401/13) to forward support bracket on starter upper duct using clamps (401/19), washers (401/18), and bolts (401/17). Torque bolts to 20 − 25 lb−in. (2.26 − 2.82 N.m).

(15) Attach tube (401/9) to forward support bracket on starter upper duct using clamp (401/16), washer (401/18), and bolt (401/17). Torque bolt to 20 − 25 lb−in. (2.26 − 2.82 N.m).

(16) Attach tube (401/15) to two support brackets on left side 2.9 bellows using clamps (401/19), bolts (401/17), washers (401/18), and nuts (401/20). Torque nuts to 20 − 25 lb−in. (2.26 − 2.82 N.m).

(17) Attach tube (401/12) to upper support bracket on left side 2.9 bellows using clamp (401/19), bolt (401/17), washer (401/18), and nut (401/20). Torque nut to 20 − 25 lb−in. (2.26 −2.82 N.m).

(18) Attach tube (401/11) to support bracket on left side 2.9 bleed bellows using clamp (401/19), bolt (401/17), washer (401/18), and nut (401/20). Torque nut to 20 − 25 lb−in. (2.26 − 2.82 N.m).

POWER PLANT GENERAL − HIGH PRESSURE COMPRESSOR (HPC) − INSTALLATION−07

(19) Connect hose (401/21) to lower elbow (401/1) on bracket, at Flange M, and torque hose coupling to 180 − 200 lb−in. (20.3 − 22.6 N.m).

(20) Connect hose (401/22) to upper right elbow (401/4) on bracket, at Flange M, and torque hose coupling to 270 − 300 lb−in. (30.5 − 33.9 N.m).

(21) Connect hose (401/23) to upper left elbow (401/1) on bracket, at Flange M, and torque hose coupling to 180 − 200 lb−in. (20.3 − 22.6 N.m).

POWER PLANT GENERAL - HIGH PRESSURE COMPRESSOR (HPC) - INSTALLATION-08

Task 71-00-35-450-013:

1. Install TRC Valve Cooling Tube

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P06-002	Petrolatum, White

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIG.	ITEM
Lockwire, MS20995C32				

B. Procedure

See Figure 401.

(1) Lubricate packings (401/1) with Petrolatum (P06-002).

(2) Install connector coupling body on TRC valve cooling tube (401/2) and coupling nut on ignition cooling duct (401/3).

(3) Install washer and packing in coupling nut, install washer and packing on coupling body using lubricated packings to retain washers.

(4) Secure ignition coupling duct (401/3) and TRC valve cooling tube (401/2) together with snap retainer.

(5) Engage connector body and coupling nut threads and tighten coupling nut fingertight.

NOTE: Connector consists of coupling body, coupling nut, two washers, and snap retainer.

(6) Install TRC valve cooling tube (401/2) to bracket using clamp (401/4), screw (401/7), washer (401/5), and nut (401/6). Torque nut 20 - 25 lb-in. (2.3 - 2.8 N.m).

(7) Lubricate packings (401/1) with Petrolatum (P06-002).

POWER PLANT GENERAL − HIGH PRESSURE COMPRESSOR (HPC) − INSTALLATION−08

(8) Install connector coupling body on right TRC valve cooling tube (401/2) and coupling nut on TRC valve.

(9) Install washer and packing in coupling nut, install washer and packing on coupling body using lubricated packings to retain washers.

(10) Secure TRC valve cooling tube (401/2) and TRC valve together with snap retainer. Engage connector body and coupling nut threads and tighten fingertight.

(11) Torque connectors at both ends of cooling tube (401/2) to 65 − 80 lb−in. (7.34 − 9.04 N.m).

(12) Connect flex hose (401/8) to cooling tube and TBVCA valve using clamps (401/9). Torque clamps to 25 − 30 lb−in. (2.8 − 3.4 N.m).

POWER PLANT GENERAL - HIGH PRESSURE COMPRESSOR (HPC) - INSTALLATION-09

Task 71-00-35-450-014:

1. Install Oil System Tubes

   A. Equipment And Materials Required - None

   B. Procedure

   See Figure 401.

   (1) Install oil tube (401/1) to union in LB6 port and to tee in oil pressure transmitter. Torque coupling nuts to 135 - 150 lb-in. (15.25 - 16.95 N.m).

   (2) Attach oil tube (401/1) to brackets with clamps (401/2), screws (401/3), washers (401/4), and nuts (401/5). Torque nuts to 20 - 25 lb-in. (2.26 - 2.82 N.m). Two places.

   (3) Install tee (401/6) in oil tube support bracket with washer (401/7) and nut (401/8). Torque nut to 90 - 100 lb-in. (10.17 - 11.29 N.m).

   (4) Connect tube (401/9) to reducer in LP1 port and to tee (401/6) in oil tube support bracket. Torque tube coupling to 135 - 150 lb-in. (15.25 - 16.95 N.m).

   (5) Attach oil tube (401/9) to oil tube (401/1) with clamps (401/2), screws (401/3), washer (401/4), and nut (401/5). Torque nut to 20 - 25 lb-in. (2.26 - 2.82 N.m).

   (6) Attach oil tube (401/9) to existing engine tube with two clamps (401/2, 401/10), bolt (401/11), washer (401/4), and nut (401/5). Torque nut to 20 - 25 lb-in. (2.26 - 2.82 N.m).

   (7) Connect hose assembly (401/12) to tee (401/6) in oil tube support bracket and to union in bottom of oil pressure transmitter. Torque coupling nuts to 135 - 150 lb-in. (15.25 - 16.95 N.m).

   (8) Connect oil tube (401/13) to tee (401/6) in oil tube support bracket and to union in top of low oil pressure warning switch. Torque coupling nuts to 135 - 150 lb-in. (15.25 - 16.95 N.m).

(9) Connect oil tube (401/14) to tee in top of oil pressure transmitter and to union in bottom of low oil pressure warning switch. Torque coupling nuts to 135 − 150 lb−in. (15.25 − 16.95 N.m).

(10) Attach oil tubes (401/13) and (401/14) together with clamps (401/15), spacer (401/16), bolt (401/17), washer (401/4), and nut (401/5). Torque nut to 20 − 25 lb−in. (2.26 − 2.82 N.m).

(11) Attach hose assembly (401/12) to oil tube (401/14) with two clamps (401/10, 401/15), bolt (401/11), washer (401/4), and nut (401/5). Torque nut to 20 − 25 lb−in. (2.26 − 2.82 N.m).

(12) Remove top two bolts (401/16) from oil cooler bypass valve and install bracket (401/17) on bypass valve.

(13) Connect oil tube (401/18) to restrictor in LP5 port and to union in oil filter differential pressure switch. Torque coupling nuts to 135 − 150 lb−in. (15.25 − 16.95 N.m).

(14) Connect oil tube (401/19) to restrictor in LP4 port and to union oil filter differential pressure switch. Torque coupling nuts to 135 − 150 lb−in. (15.25 − 16.95 N.m).

(15) Attach oil tubes (401/18) and (401/19) to bracket with clamps (401/2), screw (401/3), washer (401/4), and nut (401/5). Torque nut to 20 − 25 lb−in. (2.26 − 2.82 N.m).

(16) Attach oil tube (401/18) to engine bracket with clamp (401/2), screw (401/3), washer (401/4), and nut (401/5). Torque nut to 20 − 25 lb−in. (2.26 − 2.82 N.m).

POWER PLANT GENERAL - DIFFUSER AND COMBUSTOR - REMOVAL-05

Task 71-00-41-050-005:

1. Remove Engine Bleed Air Ducting
   - A. Equipment And Materials Required - None
   - B. Procedure
     - (1) Remove right 8th stage duct. See Figures 301, 302 and 303.
       - (a) Remove bolt, washer, bushing and nut attaching support link to bracket.
       - (b) For engines incorporating additional pneumatic duct support link (Post SB PWNAC 36-6 and SB PWNAC 36-9), remove bolt, washer and nut attaching clamp/bracket support link to engine case bracket. See Figures 302 and 303.
       - (c) For engines incorporating additional pneumatic duct support link (Post SB PWNAC 36-6 and SB PWNAC 36-9), remove bolt, washer and nut attaching support link to duct clamp/bracket. See Figures 302 and 303.
       - (d) For engines incorporating additional pneumatic duct support link (Post SB PWNAC 36-6, Pre SB PWNAC 36-9), remove two bolts, washers, and nuts attaching clamp to duct. See Figure 302.
       - (e) Remove coupling and seal attaching right 8th stage duct to mid-stage duct.
       - (f) Remove lockwire and eight bolts that attach bracket, elbow and gasket to engine core. Discard lockwire and gasket.
       - (g) Remove right 8th stage duct with check valve and elbow attached from engine core.
       - (h) Install protective cover over core port.
     - (2) Remove pressure regulating duct. See Figure 304.
       - (a) Remove coupling and seal attaching starter upper duct to starter lower duct.
       - (b) Remove three bolts, washers, bushings and nuts attaching three support links to three brackets.
       - (c) Remove coupling and seal attaching pressure regulating duct to pressure regulating valve.
       - (d) Remove pressure regulating duct with starter upper duct attached from engine core.
       - (e) Install protective cover over valve port.
     - (3) Remove left 8th stage duct and mid-stage duct. See Figure 305.
       - (a) Remove lockwire and eight bolts that attach bracket, left 8th stage duct and gasket to engine core. Discard lockwire and gasket.
       - (b) Remove coupling and seal attaching mid-stage duct to high stage bleed control valve.
       - (c) Remove coupling and seal attaching mid-stage duct to pressure regulating valve.

Left 8th Stage And Mid-Stage Ducts Removal
Figure 305
(Task 71-00-41-050-005)

(d) Remove mid−stage duct with left 8th stage duct and check valve attached from engine core.

(e) Install protective covers over core port and two valve ports.

(4) Remove 15th stage manifold. See Figures 306, 307 and 308.

(a) For engines incorporating additional pneumatic duct support link (Post SB PWNAC 36−4 and SB PWNAC 36−8), remove bolt, washer and nut attaching support link to engine bracket. See Figures 307 and 308.

(b) For engines incorporating additional pneumatic duct support link (Post SB PWNAC 36−4 and SB PWNAC 36−8), remove bolt, washer and nut attaching support link to manifold clamp/bracket. See Figures 307 and 308.

(c) For engines incorporating additional pneumatic duct support link (Post SB PWNAC 36−4, Pre SB PWNAC 36−8), remove four bolts, washers, and nuts attaching clamp to manifold. See Figure 307.

(d) Remove coupling and seal attaching upper anti−ice duct to lower anti−ice duct.

(e) Remove coupling and seal attaching 15th stage manifold to high pressure bleed control valve.

(f) Remove lockwire and six bolts that attach 15th stage manifold to engine core in four places. Discard lockwire.

(g) Remove 15th stage manifold with upper anti−ice duct attached from engine core.

(h) Install protective covers over four core ports and valve port.

POWER PLANT GENERAL − DIFFUSER AND COMBUSTOR − REMOVAL−06

Task 71−00−41−050−006:

1. Remove Fuel Flow Transmitter
   A. Equipment And Materials Required − None
   B. Procedure
   See Figure 301.
      (1) Disconnect tube from transmitter and install protective covers to tube and transmitter.
      (2) Remove bolts and washers attaching bracket (301/2) to bracket (301/1).
      (3) Remove four bolts attaching F3 adapter and seal plate to fuel flow transmitter.

POWER PLANT GENERAL - DIFFUSER AND COMBUSTOR - REMOVAL-07

Task 71-00-41-050-007:

1. Remove Engine Pump Case Drain Filter Modules

A. Equipment And Materials Required

Standard Tools:

Name	Manufacturer
Container, approximately 2 U.S. gallons (7.57 l)	Local Purchase

B. Procedure
See Figure 301.

WARNING: HYDRAULIC FLUID MAY CAUSE EYE, NOSE, AND SKIN IRRITATION. AVOID PROLONGED BREATHING OF MIST OR VAPOR AND PROLONGED OR REPEATED CONTACT WITH SKIN. IF THERE IS A POSSIBILITY OF SPLASH, WEAR GOGGLES. PROTECTIVE GLOVES SHOULD BE WORN DURING USE TO PREVENT DRYING THE SKIN DUE TO CONTACT WITH HYDRAULIC FLUID.

(1) Position container under engine pump case drain filters to catch residual hydraulic fluid.
(2) Remove hoses from unions and install protective covers on hoses.
(3) Remove unions and install protective covers on ports of filter.
(4) Remove screws, bolts, nuts, and washers attaching angled brackets to filter module and remove brackets.
(5) Remove screws and washers attaching filter module assembly to engine bracket and remove module.

POWER PLANT GENERAL - DIFFUSER AND COMBUSTOR - REMOVAL-08

Task 71-00-41-050-008:

1. Remove Hydraulic Case Drain Filter

A. Equipment And Materials Required

Standard Tools:

Name	Manufacturer
Container, approximately 2 U.S. gallons (7.57 l)	Local Purchase

B. Procedure
See Figure 301.

WARNING: HYDRAULIC FLUID MAY CAUSE EYE, NOSE, AND SKIN IRRITATION. AVOID PROLONGED BREATHING OF MIST OR VAPOR AND PROLONGED OR REPEATED CONTACT WITH SKIN. IF THERE IS A POSSIBILITY OF SPLASH, WEAR GOGGLES. PROTECTIVE GLOVES SHOULD BE WORN DURING USE TO PREVENT DRYING THE SKIN DUE TO CONTACT WITH HYDRAULIC FLUID.

(1) Loosen band clamp attaching filter blanket and remove blanket.
(2) Position container under filter case to allow catch residual hydraulic fluid.
(3) Remove lockwire and case from head of drain filter.
(4) Remove retainer clip, ring, packing and filter. Discard ring, packing and filter.

NOTE: For additional information concerning detailed maintenance of this component, see Filter Assembly Component Maintenance Manual, 29-12-02 (Purolator, Inc. PN 7578944).

POWER PLANT GENERAL - DIFFUSER AND COMBUSTOR - REMOVAL-09

Task 71-00-41-050-009:

1. Remove Engine Pump Case Drain Filter Module Check Valve

A. Equipment And Materials Required

Standard Tools:

Name	Manufacturer
NSK1521, Fitting Tool	Purolator Inc. Aerospace Division 950 Rancho Conejo Blvd. Newbury Park, CA 91320
Container, approximately 2 U.S. gallons (7.57 l)	Local Purchase

B. Procedure
See Figure 301.

WARNING: HYDRAULIC FLUID MAY CAUSE EYE, NOSE, AND SKIN IRRITATION. AVOID PROLONGED BREATHING OF MIST OR VAPOR AND PROLONGED OR REPEATED CONTACT WITH SKIN. IF THERE IS A POSSIBILITY OF SPLASH, WEAR GOGGLES. PROTECTIVE GLOVES SHOULD BE WORN DURING USE TO PREVENT DRYING THE SKIN DUE TO CONTACT WITH HYDRAULIC FLUID.

(1) Position container under filter module to allow residual hydraulic fluid to drain during procedure.
(2) Loosen band clamp attaching filter insulation blanket and remove blanket and clamp.
(3) Remove lockwire and unscrew filter case from filter module.
(4) Using Fitting Tool NSK1521, remove filter module check valve, sleeve and spring from head of filter module.
(5) Remove packing from valve. Discard packing.
(6) Remove ring and packing from head of filter module. Discard packing.

NOTE: For additional information concerning detailed maintenance of this component, see Filter Assembly Component Maintenance Manual, 29-12-02 (Purolator, Inc. PN 7578944).

POWER PLANT GENERAL − DIFFUSER AND COMBUSTOR − REMOVAL−10

Task 71−00−41−050−010:

1. Remove Pylon Drain Tubing
   A. Equipment And Materials Required − None
   B. Procedure
      See Figures 301 and 302.
      (1) Remove hose assembly attached to top tube assembly.
      (2) Remove nut and washer attaching top tube assembly to bracket.
      (3) Disconnect top tube assembly coupling nut from middle tube assembly.
      (4) Remove nut, washer, and bolt from clamp attached to engine bracket and remove top tube assembly.
      (5) Remove nut and washer attaching middle tube assembly to engine bracket.
      (6) Remove nut, bolt and washer attaching middle tube assembly clamp to P&W tube assembly.
      (7) Remove nut, washer and bolt attaching middle tube assembly clamp to engine bracket.
      (8) Disconnect middle tube assembly coupling nut from union in lower tube assembly and remove middle tube assembly.
      (9) Remove union from lower tube assembly.
      (10) Remove nut washer and bolt attaching lower tube assembly to bracket installed on TCA inlet pad.
      (11) Remove nut, washer, and bolt attaching lower tube assembly clamp to P&W bracket.
      (12) Disconnect lower tube assembly coupling nut from bottom tube assembly and remove lower tube assembly.
      (13) Remove union from bottom tube assembly.
      (14) Disconnect bottom tube assembly coupling nut from drain mast.
      (15) Remove nuts, washers, and bolts attaching two bottom tube assembly clamps to engine brackets and remove bottom tube assembly.

   A. Equipment And Materials Required

Special Tools:
RSE1101 PW Alignment Tool

Consumable Materials:

Item No.	Designation
P03-005	Lubricating Oil
P06-013	Solid Film Lubricant

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Lockwire, MS20995N20		As Required		

B. Procedure
(1) Install 15th stage manifold. See Figures 401, 402 and 403.

(a) Install gaskets, flow restrictors, and 15th stage manifold with anti-ice upper duct attached on engine core with bolts lubricated with Lubricating Oil (P03-005).
(b) Torque bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m) and lockwire bolts.
(c) Lubricate inside surface of coupling with Solid Film Lubricant (P06-013) and install seal and coupling attaching 15th stage manifold to high pressure bleed control valve. Tighten coupling fingertight.
(d) Lubricate inside surface of coupling with Solid Film Lubricant (P06-013) and install seal and coupling attaching upper anti-ice duct to lower anti-ice duct. Tighten coupling fingertight.
(e) For engines incorporating additional pneumatic duct support link (Post SB PWNAC 36-4, Pre SB PWNAC 36-8), position the upper and lower clamp halves on the manifold and attach with four bolts, washers and nuts. Tighten nuts fingertight. Ensure clamp bearing surfaces do not bear on the manifold weld bead. See Figure 402.

(f) For engines incorporating addition pneumatic duct support link (Post SB PWNAC 36−4 and SB PWNAC 36−8), adjust support link to nominal length of 3.10 inches (78.74 mm) and attach to manifold clamp/bracket with bolt, washer and nut. Torque bolt 50 − 70 lb−in. (7.3 − 9.6 N.m). See Figures 402 and 403.

(g) For engines incorporating additional pneumatic duct support link (Post SB PWNAC 36−4 and SB PWNAC 36−8), attach support link with bolt, washer and nut to engine core bracket. Torque bolt 50 − 70 lb−in. (5.7 − 7.9 N.m). Adjust manifold clamp as required to achieve in−line position for link to engine core bracket. See Figures 402 and 403.

(h) For engines incorporating additional pneumatic duct support link (Post SB PWNAC 36−4, Pre SB PWNAC 36−8), torque four manifold clamp bolts 45 − 55 lb−in. (5.1 − 6.2 N.m). See Figure 402.

(2) Install left 8th stage and mid−stage ducts. See Figure 404.

(a) Install ground cable support bracket, gasket and left 8th stage duct with mid−stage duct and check valve attached to engine core with bolts lubricated with Lubricating Oil (P03−005). Torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m) and lockwire bolts.

(b) Lubricate inside surface of coupling with Solid Film Lubricant (P06−013) and attach mid−stage duct and seal to high pressure bleed valve. Tighten coupling fingertight.

(c) Lubricate inside surface of coupling and attach mid−stage duct and seal to pressure regulating valve. Tighten coupling fingertight.

(d) Adjust support link to nominal length of 4.50 inches (114.300 mm) and attach to mid−stage and 8th stage duct with bolt, washers, and nuts. Torque bolts to 50 − 70 lb−in. (5.649 − 7.909 N.m).

(e) Apply one−half turn of tension adjustment to support link and torque locking nut to 100 − 140 lb−in. (11.298 − 15.818 N.m).

(3) Install RSE1101 Alignment Tool. See Figure 405.

(a) Install RSE1101 Alignment Tool on engine forward mount pad.

(b) Install pressure regulating duct on alignment tool with 0.0 inch (0.0 mm) gap between alignment tool plate and duct.

(4) Install pressure regulating duct. See Figure 406.

(a) Adjust support Links A, B, and C to nominal lengths shown on Figure 402.

Figure 406
(Task 71−00−41−450−005)

(b) Attach support links to flange brackets with bushing, bolt, washer and nut. Torque nuts 50 − 70 lb−in. (5.649 − 7.909 N.m).

(c) Lubricate inside surfaces of coupling with Solid Film Lubricant (P06−013) and attach seal and pressure regulating duct, with starter upper duct attached, to pressure regulating valve. Tighten coupling fingertight.

(d) Lubricate inside surfaces of coupling with Solid Film Lubricant (P06−013) and attach seal and starter upper duct to starter lower duct. Tighten coupling fingertight.

NOTE: Additional coupling and seal are to be used to attach pressure regulating duct to pylon interface duct when the engine is mounted on the aircraft pylon.

(5) Install right 8th stage duct. See Figures 407, 408 and 409.

(a) Install ground cable support bracket, 8th stage duct with check valve and elbow attached, and gasket with bolts lubricated with Lubricating Oil (P03−005) to engine core. Torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(b) Lubricate inside surfaces of coupling with Solid Film Lubricant (P06−013) and attach 8th stage duct and seal to mid−stage duct. Tighten coupling fingertight.

(c) Adjust support link to 2.62 inches (66.55 mm) and attach bracket to Flange J with bolt, washer and nut. Torque nut to 50 − 70 lb−in. (5.649 − 7.909 N.m).

(d) For engines incorporating additional pneumatic duct support link (Post SB PWNAC 36−6, Pre SB PWNAC 36−9), position the upper and lower halves of clamp on 8th stage manifold and attach with two bolts, washers and nuts. Tighten nuts fingertight. See Figure 408.

(e) For engines incorporating additional pneumatic duct support link (Post SB PWNAC 36−6 and SB PWNAC 36−9), attach support link (2) to manifold clamp/bracket with bolt, washer and nut. See Figures 408 and 409.

(f) For engines incorporating additional pneumatic duct support link (Post SB PWNAC 36−6 and SB PWNAC 36−9), adjust support link for no−preload length, plus one−half turn in the tension direction, and attach to support bracket on engine Flange K with bolt, washer and nut. Adjust manifold clamp as required to achieve in−line position for link to engine flange bracket. See Figures 408 and 409.

(g) For engines incorporating additional pneumatic duct support link (Post SB PWNAC 36−6 and SB PWNAC 36−9), torque bolts installed in steps (e) and (f) to 50 − 70 lb−in. (7.3 − 9.6 N.m). See Figures 408 and 409.

(h) For engines incorporating additional pneumatic duct support link (Post SB PWNAC 36−6, Pre SB PWNAC 36−9), tighten two bolts on manifold clamp to 45 − 55 lb−in. (5.1 − 6.2 N.m). Maintain 0.050 − 0.110 inch (1.27 − 2.79 mm) gap between clamp halves. See Figure 408.

(6) Torque all couplings installed fingertight to value indicated on couplings. Tap outer perimeter of couplings with plastic mallet while tightening.

(7) Adjust all support links to a no−preload condition, then add one−half turn of tension adjustment to support links and torque locking nuts to 100 − 140 lb−in. (11.298 − 15.818 N.m).

POWER PLANT GENERAL - DIFFUSER AND COMBUSTOR - INSTALLATION-06

Task 71-00-41-450-006:

1. Install Fuel Flow Transmitter

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Engine Oil
P06-053	Lubricant, Seal Ring (PWA 36500)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	XX/XX/XX
Lockwire (MS20995C32)		

B. Procedure
See Figure 401.

(1) Lubricate new packing with Seal Ring Lubricant P06-053.

(2) Install packing on F3 adapter.

(3) Install transmitter with bracket and adapter attached on F3 adapter using four bolts and washers.

(4) Torque bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m). Lockwire bolts.

(5) Attach bracket (401/1) to bracket (401/2) with two bolts and washers. Torque bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m). Lockwire bolts.

(6) Connect tube to adapter threads lubricated with Engine Oil P03-001 on fuel flow transmitter.

(7) Torque the tube nut to 100 - 110 lb-in. (11.298 - 12.428 N.m), loosen the tube nut. Torque the tube nut again to the specified limit. Lockwire tube nut.

POWER PLANT GENERAL − DIFFUSER AND COMBUSTOR − INSTALLATION−07

Task 71−00−41−450−007:

1. Install Engine Pump Case Drain Filter Modules

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P02−001	Hydraulic Fluid

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing NAS1612−6	4	
Lockwire, MS20995C32	AR	

B. Procedure
See Figure 401.

WARNING: HYDRAULIC FLUID MAY CAUSE EYE, NOSE, AND SKIN IRRITATION. AVOID PROLONGED BREATHING OF MIST OR VAPOR AND PROLONGED OR REPEATED CONTACT WITH SKIN. IF THERE IS A POSSIBILITY OF SPLASH, WEAR GOGGLES. PROTECTIVE GLOVES SHOULD BE WORN DURING USE TO PREVENT DRYING THE SKIN DUE TO CONTACT WITH HYDRAULIC FLUID.

(1) Install engine pump case drain filter module with screw and washers. Tighten screws fingertight only.

(2) Install angle brackets with bolts, screws, washers and nuts. Tighten screws and bolts fingertight only.

(3) Torque screws to 50 − 70 lb−in. (5.649 − 7.909 N.m) and bolts to 20 − 25 lb−in. (2.260 − 2.825 N.m).

(4) Remove protective covers from filter ports.

(5) Lubricate union threads with Hydraulic Fluid P02−001.

(6) Install unions, rings, and packings in filter ports. Torque unions 250 − 300 lb−in. (28.246 − 33.895 N.m).

(7) Remove protective covers from hoses and install hoses on unions. Torque hose coupling 270 − 290 lb−in. (30.506 − 33.895 N.m).

WARNING: HYDRAULIC FLUID MAY CAUSE EYE, NOSE, AND SKIN IRRITATION. AVOID PROLONGED BREATHING OF MIST OR VAPOR AND PROLONGED OR REPEATED CONTACT WITH SKIN. IF THERE IS A POSSIBILITY OF SPLASH, WEAR GOGGLES. PROTECTIVE GLOVES SHOULD BE WORN DURING USE TO PREVENT DRYING THE SKIN DUE TO CONTACT WITH HYDRAULIC FLUID.

(1) Lubricate packing, ring and threads of case with Hydraulic Fluid (P02-001).
(2) Install ring and packing on engine pump case drain filter.
(3) Insert filter into case, secure with retainer clip and install case in filter module head.
(4) Torque case 180 - 240 lb-in. (20.337 - 27.116 N.m) and lockwire.
(5) Slide band clamp and insulation blanket over filter case and tighten clamp.

POWER PLANT GENERAL - DIFFUSER AND COMBUSTOR - INSTALLATION-10

Task 71-00-41-450-010:

1. Install Pylon Drain Tubing
   - A. Equipment And Materials Required - None
   - B. Procedure

     See Figures 401 and 402.
     - (1) Position bottom tube assembly and attach to drain mast union. Torque coupling nut 450 - 500 lb-in. (50.843 - 56.492 N.m).
     - (2) Position two clamps on bottom tube assembly and attach to engine brackets with bolts, washers, and nut. Torque nuts 20 - 25 lb-in. (2.260 - 2.825 N.m).
     - (3) Install union in bottom tube assembly. Torque union 215 - 240 lb-in. (24.292 - 27.116 N.m).
     - (4) Position lower tube assembly and attach to bottom tube assembly union. Torque coupling nut 450 - 500 lb-in. (50.843 - 56.492 N.m).
     - (5) Position two clamps on lower tube assembly and attach to engine TCA inlet pad bracket and P&W engine bracket with bolts, washers, and nuts. Torque nuts 20 - 25 lb-in. (2.260 - 2.825 N.m).
     - (6) Install union in lower tube assembly. Torque union 215 - 240 lb-in. (24.292 - 27.116 N.m).
     - (7) Position middle tube assembly and attach to lower tube assembly union. Torque coupling nut 450 - 500 lb-in. (50.843 - 56.492 N.m).
     - (8) Insert middle tube assembly fitting in engine flange bracket and attach with washer and nut. Torque nut 215 - 240 lb-in. (24.292 - 27.116 N.m).
     - (9) Position clamp on middle tube assembly and attach to P&W tube assembly clamp with bolt, washer and nut. Torque nut 20 - 25 lb-in. (2.260 - 2.825 N.m).
     - (10) Position top tube assembly and attach to middle tube assembly. Torque coupling nut 450 - 500 lb-in. (50.843 - 56.492 N.m).
     - (11) Insert top tube assembly fitting into bellows brackets and attach with washer and nut. Torque nut 215 - 240 lb-in. (24.292 - 27.116 N.m).
     - (12) Attach hose assembly to top tube assembly. Torque coupling nut 450 - 500 lb-in. (50.843 - 56.492 N.m).

POWER PLANT GENERAL - HIGH PRESSURE TURBINE (HPT) - REMOVAL-01

Task 71-00-52-050-006:

1. Remove Ignition Cooling Duct And Hoses

A. Equipment And Materials Required - None

B. Procedure

See Figure 301.

(1) Disconnect clamps securing hose (301/8) to ignition cooling duct and from lower ignition exciter.

(2) Disconnect clamps securing hose (301/6) to ignition cooling duct and from upper ignition exciter.

(3) Disconnect clamp, screw, and washer securing ignition cooling duct to hydraulic filter bracket.

(4) Cut lockwire and disconnect connector body from coupling nut.

(5) Disconnect TCC duct and ignition cooling duct by releasing snap retainer. Remove and discard packings.

(6) Remove connector coupling body from ignition cooling duct and coupling nut on TCC duct.

Task 71-00-52-050-007:

1. Remove Hydraulic Pump Filter Support Bracket

A. Equipment And Materials Required - None

B. Procedure

See Figure 301.

(1) Remove lockwire and disconnect bolts securing hydraulic filter support bracket to two mounting brackets on engine case.

(2) Remove bolts securing hydraulic filter support bracket to mounting bracket on Flange M.

(3) Remove hydraulic filter support bracket from engine.

Task 71−00−52−450−006:

1. Install Ignition Cooling Duct And Hoses

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P02−002	Petrolatum, White

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Lockwire, MS20995C32				

B. Procedure

See Figure 401.

(1) Lubricate packings (401/1) with White Petrolatum (P06−002).

(2) Install connector coupling body on ignition cooling duct (401/2) and coupling nut on TCC duct.

(3) Install washer and packing in coupling nut, install washer and packing on coupling body using lubricated packings to retain washers.

(4) Secure TCC duct and ignition cooling duct (401/2) together with snap retainer.

(5) Engage connector body and coupling nut threads, then torque to 15.3 − 18.7 lb−ft. (20.7 − 25.4 N.m) and lockwire.

NOTE: Connector consists of coupling body, coupling nut, two washers, and snap retainer.

(6) Attach ignition cooling duct (401/2) to hydraulic filter bracket with clamp (401/3), screws (401/4), and washers (401/5). Torque nuts to 50 − 70 lb−in. (5.7 − 7.9 N.m).

(7) Connect hose (401/6) to ignition cooling duct and upper ignition exciter with clamps (401/7). Torque clamps 25 − 30 lb−in. (2.8 − 3.4 N.m).

(8) Connect hose (401/8) to ignition cooling duct and lower ignition exciter with clamps. Torque clamps 25 − 30 lb−in. (2.8 − 3.4 N.m).

Task 71-00-52-450-007:

1. Install Hydraulic Pump Filter Support Bracket

A. Equipment And Materials Required - None

B. Procedure

See Figure 401.

(1) Install hydraulic filter support bracket on mounting bracket at Flange M using bolts and washers. Torque bolts to 100 - 140 lb-in. (11.29 - 15.82 N.m).

(2) At two brackets forward of Flange M on engine case attach hydraulic filter support bracket using bolts and washers. Torque bolts to 50 - 70 lb-in. (5.65 - 7.91 N.m).

(3) Lockwire nuts securing hydraulic filter support bracket to mounting brackets on engine case.

POWER PLANT GENERAL − LOW PRESSURE TURBINE (LPT) − REMOVAL−01

Task 71−00−53−050−001:

1. Remove Turbine Case Cooling (TCC) Duct And Bellows
   - A. Prerequisites
     - (1) Remove ignition cooling ducts. See 71−00−41, Removal−06 (Task 71−00−41−050−006).
   - B. Equipment And Materials Required − None
   - C. Procedure

     See Figure 301.

     - (1) Remove eight bolts and nuts attaching TCC duct to TCC valve.
     - (2) Remove five bolts, washers and nuts attaching TCC support plate to engine.
     - (3) Remove TCC duct with bellows and support plate from engine.

POWER PLANT GENERAL - LOW PRESSURE TURBINE (LPT) - REMOVAL-02

Task 71-00-53-050-002:

1. Remove Starter Air Supply Duct
   - A. Prerequisites - None
   - B. Equipment And Materials Required - None
   - C. Procedure

     See Figures 301 and 302.
     - (1) Remove starter air supply intermediate duct.
       - (a) Loosen nuts to remove couplings that secure intermediate duct to upper and lower ducts.
       - (b) Remove nuts, washers and bolts that attach two support brackets and intermediate duct to engine Flange N brackets.
       - (c) Remove intermediate duct.
       - (d) Remove and discard seals.
       - (e) Install protective covers on ducts.
     - (2) Remove starter air supply lower duct.
       - (a) Loosen nut to remove coupling that secures lower duct to pneumatic starter shutoff valve.
       - (b) Remove nuts, washers and bolts that attach two support brackets and lower duct to engine Flange N brackets.
       - (c) Remove lower duct.
       - (d) Remove and discard seal.
       - (e) Install protective covers on duct and pneumatic starter shutoff valve.
     - (3) Remove eight bolts and washers that connect turbine case cooling (TCC) duct to TCC valve. Retain bolts and washers with TCC valve.

Packing	2	(TBD)		
Nuts	6			

Lockwire, MS20995C32

   B. Procedure
      (1) Install TCC duct and bellows: See Figure 401.
         (a) Install TCC duct with TCC bellows on TCC support plate using five bolts, washers and nuts. Torque nuts to 125 - 140 lb-in. (14.123 - 15.818 N.m).
         (b) Remove protective covers from end of TCC valve, duct and bellows.
         (c) Install TCC duct with TCC bellows on TCC valve using eight bolts and washers. Torque bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

   C. Postrequisites
      (1) Install ignition, starter valve and PMA cooling ducts. See 71-00-41, Installation-03 (Task 71-00-41-450-002).

POWER PLANT GENERAL - LOW PRESSURE TURBINE (LPT) - INSTALLATION-02

Task 71-00-53-450-002:

1. Install Starter Air Supply Duct

A. Prerequisites

(1) Install P flange brackets. See Installation-01 (Task 71-00-53-450-001).

B. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P06-013	Lubricant, Solid Film
P06-020	Lubricant, Bolt - Molybdenum Disulfide

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Seal	1	TO BE DETERMINED		
Seal	2	TO BE DETERMINED		

C. Procedure

See Figure 401 and 402.

(1) Adjust starter air supply lower duct support link (401/1) to length of 6.34 inch (161.036 mm).

(2) Adjust lower duct support link (401/2) to length of 3.10 inch (78.740 mm).

(3) Adjust intermediate duct support link (401/3) to length of 4.25 inch (107.950 mm).

(4) Adjust intermediate duct support link (401/2) to length of 3.10 inch (78.740 mm).

(5) Remove protective covers from ducts and pneumatic starter shutoff valve.

(6) Attach two support brackets (401/4), connected to lower duct, to forward side of engine Flange N brackets with bolts (401/5), washers (401/6) and nuts (401/7). Torque nuts to 50 - 70 lb-in. (5.649 - 7.909 N.m).

(7) Attach two support brackets (401/8), connected to intermediate duct, to forward side of engine Flange N brackets with bolts (401/5), washers (401/6) and nuts (401/7). Torque nuts to 50 - 70 lb-in. (5.649 - 7.909 N.m).

(8) Lubricate inside surface of coupling (401/9) with Solid Film Lubricant (P06-013).

(9) Place seal (401/10) on lower end of lower duct and connect duct to pneumatic starter shutoff valve with coupling (401/9), after positioning seal over joint flanges. Do not torque coupling this step.

(10) Lubricate inside surfaces of two couplings (401/11) with Solid Film Lubricant (P06−013).

(11) Place seals (401/12) on each end of intermediate duct and connect to lower duct and upper duct with couplings (401/11), after positioning seals over joint flanges. Do not torque couplings this step.

(12) Adjust intermediate duct support links (401/2) and (401/3) to eliminate any preload. Torque locking nuts on both support links to 100 − 140 lb−in. (11.298 − 15.818 N.m).

(13) Adjust lower duct support links (401/1) and (401/2) to eliminate any preload. Torque locking nuts on both support links to 100 − 140 lb−in. (11.298 − 15.818 N.m).

(14) Torque coupling (401/9) to value indicated on coupling band. Tap outer perimeter of coupling with plastic mallet while tightening.

(15) Torque couplings (401/11) to values indicated on coupling bands. Tap outer perimeters of couplings with plastic mallet while tightening.

(16) Apply Molybdenum Disulfide Lubricant (P06−020) to threads of bolts (402/1).

(17) Connect turbine case cooling (TCC) duct to TCC valve with eight bolts (402/1) and washers (402/2). Torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

POWER PLANT GENERAL − TURBINE EXHAUST CASE − REMOVAL−01

Task 71−00−54−050−001:

1. Remove Engine Aft Mount

A. Equipment And Materials Required − None

B. Procedure

See Figure 301.

(1) Remove eight bolts, washers, nuts, washers, plates and retainers.

CAUTION: DO NOT ROTATE THE BOLT WHEN YOU REMOVE THE BOLT. ROTATION CAN CAUSE SCORING DAMAGE TO THE BOLT.

(2) Remove two outboard bolts, washers and nuts.

(3) Remove four bolts, washers, nuts, plates and retainers.

CAUTION: DO NOT ROTATE THE BOLT WHEN YOU REMOVE THE BOLT. ROTATION CAN CAUSE SCORING DAMAGE TO THE BOLT.

(4) Remove center bolt, washers, plates and nuts.

(5) Remove mount from engine.

NOTE: For additional information concerning detailed maintenance of the component, see Aft Engine Mount Component Maintenance Manual, 71−20−05 (P&W PN 221−0260).

POWER PLANT GENERAL – TURBINE EXHAUST CASE – REMOVAL–02

Task 71–00–54–050–002:

1. Remove Engine Exhaust Plug
   A. Equipment And Materials Required

      Special Tools:
      RSE1012 Support, Exhaust Plug

   B. Procedure
      See Figure 301.
      (1) Position RSE1012 Support under engine exhaust plug.
      (2) Remove bolts and washers attaching plug to engine Flange T1.
      (3) Remove plug and support from engine.

         NOTE: For additional information concerning detailed maintenance of the component, see Plug Assembly Component Maintenance Manual, 78–10–03.

POWER PLANT GENERAL − TURBINE EXHAUST CASE − REMOVAL−03

Task 71−00−54−050−003:

1. Remove Engine Exhaust Nozzle
   A. Equipment And Materials Required

      Special Tools:
      RSE1006 Sling, Primary Nozzle
      RSE1022 Fixture, Primary Nozzle
      RSE1011 Dolly, Primary Nozzle

   B. Procedure
      See Figure 301.
      (1) Remove four plugs from engine exhaust nozzle hoist points.
      (2) Attach RSE1006 Sling to nozzle hoist points and torque bolts to 63 − 70 lb−in. (7.118 − 7.909 N.m).
      (3) Support weight of nozzle with sling.
      (4) Remove bolts and washers attaching nozzle to engine Flange T.

      NOTE: See Figure 301 for locations of bolts. Six holes are not used.

      (5) Remove nozzle and place on RSE1022 Fixture.
      (6) Remove sling and reinstall plugs in nozzle hoist points. Torque plugs to 50 − 70 lb−in. (5.649 − 7.909 N.m).
      (7) Place nozzle and fixture on RSE1011 Dolly.

      NOTE: For additional information concerning detailed maintenance of the component, see Nozzle Assembly Component Maintenance Manual, 78−10−04.

Task 71−00−54−050−005:

1. Remove Pylon Drain Mast
   - A. Equipment And Materials Required − None
   - B. Procedure

     See Figure 301.
     - (1) Disconnect coupling nut attaching drain tube assembly to drain mast.
     - (2) Remove union installed in drain outlet mast.
     - (3) Remove two nuts, washers and bolts attaching drain mast from bracket on engine Flange P. Retain nuts, washers and bolts with engine.

POWER PLANT GENERAL − TURBINE EXHAUST CASE − INSTALLATION−01

Task 71−00−54−450−001:

1. Install Engine Aft Mount

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine

B. Procedure

See Figure 401.

(1) Slide four plates (401/1) over ends of outboard mount bearings.

CAUTION: DO NOT ROTATE THE BOLT WHEN YOU INSTALL THE BOLT. ROTATION CAN CAUSE SCORING DAMAGE TO THE BOLT.

(2) Lubricate threads of center bolt (401/2) with Engine Oil (P03−001). Position engine aft mount (401/3) on engine and install center bolt, washer (401/4), plates (401/5) and (401/6), washer (401/7) and nut (401/8).

(3) Lubricate threads of four bolts (401/9) with Engine Oil (P03−001). Install four bolts through engine flanges and plates (401/5) and (401/6) with washers (401/10) and nuts (401/11).

(4) Torque nuts (401/8) to 250 − 300 lb−in. (28.246 − 33.895 N.m).

(5) Remove nuts (401/11) and washers (401/10) from bolts (401/9) and install retainers (401/12) and (401/13) on bolts by reinstalling washers and nuts. Torque nuts to 400 − 500 lb−in. (45.194 − 56.492 N.m).

CAUTION: DO NOT ROTATE THE BOLT WHEN YOU INSTALL THE BOLT. ROTATION CAN CAUSE SCORING DAMAGE TO THE BOLT.

(6) Lubricate threads of two outboard bolts (401/14) with Engine Oil (P03−001). Install two outboard bolts, washers (401/4) and (401/7) and nuts (401/8) in outboard bearings and torque nuts to 250 − 300 lb−in. (28.246 − 33.895 N.m).

POWER PLANT GENERAL − TURBINE EXHAUST CASE − INSTALLATION−01

(7) Lubricate threads of eight bolts (401/15) with Engine Oil (P03−001). Install eight bolts and washers (401/16) through plates (401/1).

(8) Install four retainers (401/17) on bolts (401/15) and secure with washers (401/10) and nuts (401/11). Torque nuts to 400 − 500 lb−in. (45.194 − 56.492 N.m).

Task 71−00−54−450−003:

1. Install Engine Exhaust Plug
   A. Equipment And Materials Required

   Special Tools:
   RSE1012 Support, Exhaust Plug

   Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine

   B. Procedure
   See Figure 401.
   (1) Position RSE1012 Support and engine exhaust plug at engine Flange T1.
   (2) Align index hole in plug with engine Flange T1 index pin and mate plug with flange.
   (3) Install five upper bolts and washers attaching plug to engine Flange T1.
   (4) Remove the plug support fixture and install the remaining bolts, threads lubricated with Engine Oil (P03−001), and washers. Use an opposite bolt tightening pattern sequence and apply an initial torque of 100 lb−in. (11.298 N.m) to the bolts.
   (5) Use an opposite bolt tightening pattern sequence and apply the final torque of 100 − 115 lb−in. (11.298 − 12.993 N.m) to the bolts.

POWER PLANT GENERAL - TURBINE EXHAUST CASE - INSTALLATION-03

Task 71-00-54-450-002:

1. Install Engine Exhaust Nozzle

A. Equipment And Materials Required

Special Tools:
RSE1006 Sling, Primary Nozzle
RSE1022 Fixture, Primary Nozzle

R NOTE: As a result of the incorporation of SB PW4ENG
R 72-756 or PW4ENG 72-759, modification of the HPC to
R incorporate a Ring Case Configuration (RCC), it is
R not acceptable, due to weight restrictions, to
R install Thrust Reverser Improvement Program (TRIP)
R configuration thrust reversers (SN 0714001 and on)
R with Inconel exhaust nozzles (SN 1 through 0744001)
R if any of the following options are included on
R the nacelles: SCU, acoustically treated inlet or
R acoustic plug. Incorporation of an Inconel nozzle
R (PN 221-0051 SN 1 through 0744001) on a post SB
R 72-256 or SB 72-259 engine could disallow the use
R of the powerplant depending on the nacelle options.
R Refer to inspection SB PW4NAC 78-111 that defines
R the disallowed combinations which will result in an
R unacceptable propulsion system weight.

B. Procedure
See Figure 401.

(1) Remove four plugs from engine exhaust nozzle hoist points.

(2) Attach RSE1006 Sling to nozzle hoist points and torque bolts to 63 - 70 lb-in. (7.118 - 7.909 N.m).

(3) Remove nozzle from RSE1022 Fixture and position nozzle with index hole at 9 o'clock looking forward.

(4) Align index hole in nozzle with engine Flange T index pin and mate nozzle with flange.

(5) Attach nozzle to engine flange with bolts and washers. Torque bolts to initial torque of 63 lb-in. (7.118 N.m) using opposite bolt tightening sequence.

NOTE: See Figure 401 for installation of bolts. Six holes will not be used.

(6) Apply final torque of 63 − 70 lb−in. (7.118 − 7.909 N.m) to bolts using opposite bolt tightening sequence.

(7) Remove sling and reinstall plugs in nozzle hoist points. Torque plugs to 50 − 70 lb−in. (5.649 − 7.909 N.m).

Task 71−00−54−450−004:

1. Install Flange P Brackets
   - A. Equipment And Materials Required − None
   - B. Procedure

     See Figure 401.
     - (1) Attach left thrust reverser door aft hold−open rod Flange P bracket to aft face of engine Flange P with bolts and nuts in hole numbers 90 and 91. Torque nuts to 180 − 200 lb−in. (20.337 − 22.597 N.m).
     - (2) Attach right thrust reverser door aft hold−open rod Flange P bracket to aft face of engine Flange P with bolts and nuts in hole numbers 42 and 43. Torque nuts to 180 − 200 lb−in. (20.337 − 22.597 N.m).

Task 71-00-54-450-005:

1. Install Pylon Drain Mast

   A. Equipment And Materials Required - None

   B. Procedure
   See Figure 401.

      (1) Position drain mast on engine Flange P bracket and attach using two bolts, washers and nuts. Torque nuts 50 - 70 lb-in. (5.649 - 7.909 N.m).

      (2) Install union in drain mast. Torque union 215 - 240 lb-in. (24.292 - 27.116 N.m).

      (3) Attach drain tube assembly to drain mast union. Torque coupling nut to 450 - 500 lb-in. (50.843 - 56.492 N.m).

Task 71-00-54-450-011:

1. Install Exhaust Nozzle And Plug Alignment Pins

A. Equipment And Materials Required - None

B. Procedure

See Figure 401.

(1) On left side of turbine exhaust case at Flanges T and T1, install one alignment pin on each flange using washer and nut. Torque nuts 50 - 70 lb-in. (5.65 - 7.91 N.m).

NOTE: Install washers between nuts and flanges.

POWER PLANT GENERAL - MAIN GEARBOX - REMOVAL-01

Task 71-00-61-050-001:

1. Remove Hydraulic Hoses (Abex Pump)
   A. Prerequisites
      (1) Remove engine main fuel supply hose. See 71-00-61, Removal-XX (Task 71-00-61-050-XXX).
   B. Equipment And Materials Required - None
   C. Procedure
      See Figures 301 and 302.

      NOTE: Removal of insulation blankets is unnecessary during hose removal.

      (1) Remove front hydraulic pump upper case drain hose.
         (a) Remove upper case drain hose from clamp block (301/1).
            1 Remove bolt and washer securing clamp block (301/1).
            2 Open right hand clamp band and remove case drain hose from clamp block (301/).
         (b) Disconnect hose from fluid disconnect panel.
         (c) Disconnect hose from union on top of front hydraulic filter and remove hose from the engine.
      (2) Remove front hydraulic pump lower case drain hose.
         (a) Remove two clamps (302/5 and 302/7) attaching upper case drain hose to front hydraulic pump pressure hose.
         (b) Remove clamp (302/10) attaching three front hydraulic pump hoses together.
         (c) Remove clamp (302/9) attaching three front hydraulic pump hoses to bracket on main gearbox.
         (d) Remove clamp (302/11) attaching three front hydraulic pump hoses together.
         (e) Remove clamp (302/5) attaching lower case drain hose to lower hose support bracket.
         (f) Disconnect lower case drain hose from union on side of front hydraulic filter.
         (g) Disconnect lower case drain hose from reducer in front hydraulic pump and remove hose from engine.
      (3) Remove front hydraulic pump pressure hose.
         (a) Remove clamps (302/7 and 302/9) attaching pressure hose to front hydraulic pump suction hose.
         (b) Remove clamp (302/6) attaching pressure hose to lower hose support bracket.
         (c) Remove clamp (301/2) attaching pressure hose to hydraulic filter bracket.
         (d) Remove clamp (301/3) attaching pressure hose to upper hose support bracket.
         (e) Disconnect hose from fluid disconnect panel.

- (f) Disconnect hose from pulsation dampener on front hydraulic pump and remove hose from engine.

(4) Remove front hydraulic pump suction hose.
- (a) Remove clamp (302/8) attaching suction hose to lower hose support bracket.
- (b) Remove clamp (301/3) attaching suction hose to hydraulic filter bracket.
- (c) Remove clamp (301/3) attaching suction hose to upper hose support bracket.
- (d) Disconnect suction hose from fluid disconnect panel.
- (e) Disconnect suction hose from adapter on front hydraulic pump and remove hose from engine.

(5) Remove rear hydraulic pump upper case drain hose.
- (a) Remove upper case drain hose from clamp block (301/1)
  - 1 Remove bolt and washer from clamp block (301/1).
  - 2 Open left hand clamp band and remove hose from clamp block (301/1).
- (b) Disconnect upper case drain hose from the fluid disconnect panel.
- (c) Disconnect upper case drain hose from union on top of rear hydraulic filter and remove hose from engine.

(6) Remove rear hydraulic pump case drain hose.
- (a) Remove clamp (301/4) attaching three rear hydraulic hoses together.
- (b) Disconnect lower case drain hose from fluid disconnect panel.
- (c) Disconnect lower case drain hose from union on side of rear hydraulic filter and remove hose from engine.

(7) Remove rear hydraulic pump pressure hose.
- (a) Remove clamp (301/2) attaching pressure hose to hydraulic filter bracket.
- (b) Remove clamp (301/2) attaching pressure hose to upper hose support bracket.
- (c) Disconnect pressure hose from fluid disconnect panel.
- (d) Disconnect pressure hose from pulsation dampener on rear hydraulic pump and remove hose from engine.

(8) Remove rear hydraulic pump suction hose.
- (a) Remove clamp (301/3) attaching suction hose to hydraulic filter bracket.
- (b) Remove clamp (301/3) attaching suction hose to upper hose support bracket.
- (c) Disconnect suction hose from fluid disconnect panel.

  - (d) Disconnect suction hose from adapter on rear hydraulic pump and remove hose from engine.

D. Postrequisites

- (1) Remove hydraulic pump case drain filters. See 71−00−61, Removal−07 (Task 71−00−61−050−007).

POWER PLANT GENERAL - MAIN GEARBOX - REMOVAL-02

Task 71-00-61-050-002:

1. Remove Hydraulic Hoses (Sperry-Vickers Pump)
   A. Prerequisites
      (1) Remove engine main fuel supply hose. See 71-00-61, Removal-XX (Task 71-00-61-050-XXX).
   B. Equipment And Materials Required - None
   C. Procedure
      See Figures 301 and 302.

      NOTE: Removal of insulation blankets is unnecessary during hose removal.

      (1) Remove front hydraulic pump upper case drain hose.
         (a) Remove upper case drain hose from clamp block (301/1).
            1 Remove bolt and washer securing clamp block (301/1).
            2 Open right hand clamp band and remove case drain hose from clamp block (301/).
         (b) Disconnect hose from fluid disconnect panel.
         (c) Disconnect hose from union on top of front hydraulic filter and remove hose from the engine.
      (2) Remove front hydraulic pump lower case drain hose.
         (a) Remove two clamps (302/5 and 302/7) attaching upper case drain hose to front hydraulic pump pressure hose.
         (b) Remove clamp (302/10) attaching three front hydraulic pump hoses together.
         (c) Remove clamp (302/9) attaching three front hydraulic pump hoses to bracket on main gearbox.
         (d) Remove clamp (302/11) attaching three front hydraulic pump hoses together.
         (e) Remove clamp (302/5) attaching lower case drain hose to lower hose support bracket.
         (f) Disconnect lower case drain hose from union on side of front hydraulic filter.
         (g) Disconnect lower case drain hose from reducer in front hydraulic pump and remove hose from engine.
      (3) Remove front hydraulic pump pressure hose.
         (a) Remove clamps (302/7 and 302/9) attaching pressure hose to front hydraulic pump suction hose.
         (b) Remove clamp (302/6) attaching pressure hose to lower hose support bracket.
         (c) Remove clamp (301/2) attaching pressure hose to hydraulic filter bracket.
         (d) Remove clamp (301/3) attaching pressure hose to upper hose support bracket.
         (e) Disconnect hose from fluid disconnect panel.

  - (f) Disconnect hose from reducer in front hydraulic pump and remove hose from engine.
- (4) Remove front hydraulic pump suction hose.
  - (a) Remove clamp (302/8) attaching suction hose to lower hose support bracket.
  - (b) Remove clamp (301/3) attaching suction hose to hydraulic filter bracket.
  - (c) Remove clamp (301/3) attaching suction hose to upper hose support bracket.
  - (d) Disconnect suction hose from fluid disconnect panel.
  - (e) Disconnect suction hose from adapter on front hydraulic pump and remove hose from engine.
- (5) Remove rear hydraulic pump upper case drain hose.
  - (a) Remove upper case drain hose from clamp block (301/1)
    - _1_ Remove bolt and washer from clamp block (301/1).
    - _2_ Open left hand clamp band and remove hose from clamp block (301/1).
  - (b) Disconnect upper case drain hose from the fluid disconnect panel.
  - (c) Disconnect upper case drain hose from union on top of rear hydraulic filter and remove hose from engine.
- (6) Remove rear hydraulic pump case drain hose.
  - (a) Remove clamp (301/4) attaching three rear hydraulic hoses together.
  - (b) Disconnect lower case drain hose from fluid disconnect panel.
  - (c) Disconnect lower case drain hose from union on side of rear hydraulic filter and remove hose from engine.
- (7) Remove rear hydraulic pump pressure hose.
  - (a) Remove clamp (301/2) attaching pressure hose to hydraulic filter bracket.
  - (b) Remove clamp (301/2) attaching pressure hose to upper hose support bracket.
  - (c) Disconnect pressure hose from fluid disconnect panel.
  - (d) Disconnect pressure hose from reducer in rear hydraulic pump and remove hose from engine.
- (8) Remove rear hydraulic pump suction hose.
  - (a) Remove clamp (301/3) attaching suction hose to hydraulic filter bracket.
  - (b) Remove clamp (301/3) attaching suction hose to upper hose support bracket.
  - (c) Disconnect suction hose from fluid disconnect panel.

(d) Disconnect suction hose from adapter on rear hydraulic pump and remove hose from engine.

D. Postrequisites

(1) Remove hydraulic pump case drain filters. See 71-00-61, Removal-07 (Task 71-00-61-050-007).

POWER PLANT GENERAL - MAIN GEARBOX - REMOVAL-03

Task 71-00-61-050-003:

1. Remove Starter Shutoff Valve
   A. Equipment And Materials Required - None
   B. Procedure

      See Figure 301.

      (1) Disconnect electrical connector from shutoff valve. Install protective cover over plug and receptacle.

      (2) Remove coupling and seal attaching valve to starter lower-forward duct.

      (3) Remove coupling and seal attaching valve to starter lower duct.

      (4) Remove starter shutoff valve.

      (5) Remove coupling and seal attaching starter lower-forward duct to starter.

      (6) Remove lower-forward duct. Retain starter lower-forward duct and three couplings and seals with starter shutoff valve.

      (7) Install protective cover over starter port and starter lower duct port.

      (8) Install protective cover over both starter shutoff valve ports.

POWER PLANT GENERAL - MAIN GEARBOX - REMOVAL-04

Task 71-00-61-050-004:

1. Remove Integrated Drive Generator (IDG)
   A. Equipment And Materials Required

      Special Tools:
      RSE1001-1 Accessory Hoist (Optional to RSE1110)
      RSE1110 IDG Hoist Support

   B. Procedure
      See Figure 301.
      (1) Disconnect two electrical connectors, DG13A and DG13B, from IDG. Install protective covers over two electrical plugs and two receptacles.
      (2) Remove two bolts and washers attaching generator output wires to IDG. Disconnect four generator output wires. Retain nuts and washers on terminal strip studs.
      (3) Remove four nuts and washers attaching generator output wires to IDG. Disconnect four generator output wires. Retain nuts and washers on terminal strip studs.
      (4) Reinstall two bolts and washers attaching cover to IDG output wire terminal strip.
      (5) Disconnect two oil supply tubes from IDG oil-in port and IDG oil-out port. Leave unions attached to IDG. Install protective covers over two tube ends and over two IDG ports.
      (6) Position RSE1110 or RSE1001-1 Hoist under IDG and tighten holding strap securing IDG to hoist.
      (7) Loosen tension bolt of coupling attaching IDG to IDG quick-attach-detach (QAD) adapter. Continue loosening, moving lower part of coupling counterclockwise to line up "open position" mark (white) on coupling with mark (narrow groove) on bottom of IDG.
      (8) Remove IDG from QAD adapter.
      (9) Remove and discard packing from IDG drive shaft.
      (10) Install protective cover over exposed end of IDG.
      (11) Install protective cover over main gearbox port.

POWER PLANT GENERAL - MAIN GEARBOX - REMOVAL-05

Task 71-00-61-050-005:

1. Remove IDG Quick-Attach-Detach (QAD) Adapter
   A. Prerequisites
      (1) Remove Integrated Drive Generator (IDG). See Removal-04. (Task 71-00-61-050-004).
   B. Equipment And Material Required - None
   C. Procedure
      See Figure 301.
      (1) Remove eight mounting bolts attaching QAD adapter and gasket to main gearbox. Retain gasket and bolts with adapter.
      (2) Install protective cover over main gearbox port.

Task 71-00-61-050-006:

1. Remove Main Fuel Supply Line
   - A. Equipment And Materials Required - None
   - B. Procedure

     See Figure 301.
     - (1) Remove four bolts and washers attaching fuel supply hose and gasket to fuel pump inlet. Discard gasket. Retain bolts and washers with hose.
     - (2) Install protective cover over end of hose and over fuel pump inlet port.
     - (3) Remove three bolts and washers attaching lower hose support bracket to turbine cooling valve flange. Replace bolts and washers in same holes to maintain valve/duct tightness. Torque bolts 85 - 95 lb-in. (9.604 - 10.734 N.m).
     - (4) Remove two bolts and washers attaching upper hose support clamp to TCC duct bracket. Retain bolts, washers, and clamp with hose.
     - (5) Remove four bolts and washer attaching fuel supply hose and gasket to pylon interface panel. Discard gasket. Retain bolts and washers with hose.
     - (6) Install protective cover over end of hose and over pylon interface panel port.

POWER PLANT GENERAL - MAIN GEARBOX - REMOVAL-07

Task 71-00-61-050-007:

1. Remove Low Oil Pressure Switch And Oil Pressure Transmitter
   A. Equipment And Materials Required - None
   B. Procedure
      See Figure 301.
      (1) Disconnect electrical connectors.
         (a) Disconnect electrical connector from oil pressure transmitter.
         (b) Disconnect electrical connector from low oil pressure warning switch.
         (c) Install protective cover over two electrical plugs and over two receptacles.
      (2) Disconnect pressure tubes.
         (a) Disconnect pressure tube from top end of tee on top of oil pressure transmitter.
         (b) Disconnect pressure tube from bottom of oil pressure transmitter.
         (c) Disconnect pressure tube from top of low oil pressure warning switch.
         (d) Install protective covers over the ends of three pressure tubes and over three pressure ports on the two instruments.
      (3) Remove instrument mounting bracket.
         (a) Remove two bolts attaching oil low pressure switch and oil pressure transmitter mounting bracket to oil filter inlet flange. Retain bolts for reinstallation.
         (b) Remove two bolts attaching oil low pressure switch and oil pressure transmitter mounting bracket to oil filter. Retain bolts for reinstallation.
         (c) Reinstall two bolts in same holes of oil filter inlet flange. Torque bolts 75 - 85 lb-in. (8.474 - 9.604 N.m).
         (d) Reinstall two bolts in same holes of oil filter. Torque bolts 200 - 250 lb-in. (22.597 - 28.246 N.m).

POWER PLANT GENERAL - MAIN GEARBOX - REMOVAL-08

Task 71-00-61-050-008:

1. Remove Oil Filter Differential Pressure Switch
    - A. Equipment And Material Required - None
    - B. Procedure

      See Figure 301.
        - (1) Disconnect electrical connector.
        - (2) Install protective cover over electrical plug and over electrical receptacle on switch.
        - (3) Disconnect two pressure tubes. Do not remove unions and packings from switch.
        - (4) Install protective cover over tube ends and over switch ports.
        - (5) Remove three bolts, washers and nuts attaching oil filter differential pressure switch to mounting bracket. Retain bolts with switch.

Task 71−00−61−050−009:

1. Remove Engine Core Compartment Temperature Sensor
   - A. Equipment And Materials Required − None
   - B. Procedure

     See Figure 301.
     - (1) Disconnect electrical connector.
     - (2) Install protective cover over electrical plug and over receptacle.
     - (3) Remove two bolts attaching core compartment temperature sensor support bracket to gearbox at base of front hydraulic pump.
     - (4) Reinstall bolts in same holes. Torque bolts 275 − 300 lb−in. (31.071 − 33.895 N.m).

Task 71-00-61-050-010:

1. Remove Engine Oil Tank Pressure Fill System
   - A. Equipment And Materials Required - None
   - B. Procedure

     See Figure 301.
     - (1) Remove bolt, washer and nut attaching oil pressure fill/overfill dust cover retaining cords clamp to oil tank scupper drain tube. Retain bolt, washer and nut with clamp.
     - (2) Remove coupling and packing from pressure fill port. Discard packing. Retain coupling with dust cap.
     - (3) Remove coupling and packing from pressure overfill port. Discard packing. Retain coupling with dust cap.
     - (4) Install protective cover over two pressure fill/ overfill ports.

Task 71-00-61-050-011:

1. Remove Oil Quantity Transmitter

   A. Equipment And Materials Required - None

   B. Procedure

   See Figure 301.

   (1) Disconnect electrical connector.

   (2) Install protective cover over electrical plug and over receptacle.

   (3) Remove six bolts, washers and nuts attaching oil quantity transmitter, cover and heat shield bracket (Post SB PW4ENG 79-74) to oil tank.

   (4) Remove transmitter from tank. Discard packing. Retain cover, bolts, washers and nuts with transmitter.

   (5) Install protective cover over oil tank port and over exposed portion of transmitter.

POWER PLANT GENERAL − MAIN GEARBOX − REMOVAL−12

Task 71−00−61−050−012:

1. Remove Front Hydraulic Pump
   - A. Equipment And Materials Required − None
   - B. Procedure

     See Figure 301.
     - (1) Disconnect electrical and hydraulic connections.
       - (a) Disconnect electrical connector. Install protective cover over plug and receptacle.
       - (b) Disconnect pressure hose.
         - 1 (Sperry−Vickers) Leave union attached to pump.
         - 2 (Abex) Leave dampener attached to pump.
       - (c) Disconnect suction hose. Leave adapter and union attached to pump.
       - (d) Disconnect case drain hose. Leave reducer attached to pump.
       - (e) Install protective covers over three hoses and three pump ports.
     - (2) Remove pump.
       - (a) Loosen four nuts attaching hydraulic pump to mounting studs on mounting base of gearbox.
       - (b) Rotate pump clockwise until nuts pass through enlarged ends of pump mounting slots. Remove pump from mounting base.
       - (c) Remove mounting nuts and gasket from studs on mounting base. Discard gasket. Retain nuts with pump.
       - (d) Remove and discard packing from pump shaft.
       - (e) Install protective covers over pump end and over pump mounting base on gearbox.

Task 71-00-61-050-014:

1. Remove Starter Assembly
   - A. Prerequisites
     - (1) Remove shutoff valve. See Removal-03 (Task 71-00-61-050-003).
   - B. Equipment And Materials Required - None
   - C. Procedure

     See Figure 301.
     - (1) Remove starter.
       - (a) Remove coupling attaching starter to quick-attach-detach (QAD) adapter. Remove starter.
       - (b) Remove and discard packing from starter drive shaft.
     - (2) Remove quick-attach-detach (QAD) adapter.
       - (a) Remove six bolts and washers attaching QAD adapter to main gearbox.

Task 71-00-61-050-017-001:

1. Remove HP Fuel Shutoff Valve Actuator (PN 221D4003-507)
   - A. Equipment And Materials Required - None
   - B. Procedure

     See Figure 301.
     - (1) Remove electrical connector from fuel shutoff valve actuator and install protective cover on connector and receptacle.
     - (2) Remove three bolts and washers attaching fuel shutoff valve actuator to adapter assembly and remove actuator.
     - (3) Remove three bolts and washers attaching adapter assembly to fuel metering unit (FMU).

Task 71-00-61-050-017-002:

2. Remove HP Fuel Shutoff Valve Actuator (PN 221D4003-509)
   - A. Equipment And Materials Required - None
   - B. Procedure

     See Figure 302.
     - (1) Remove electrical connector from fuel shutoff valve actuator and install protective cover on connector and receptacle.
     - (2) Remove three bolts and washers attaching fuel shutoff valve actuator to adapter assembly and remove actuator.
     - (3) Remove three bolts and washers attaching adapter assembly to fuel metering unit (FMU).

POWER PLANT GENERAL - MAIN GEARBOX - REMOVAL-18

Task 71-00-61-050-018:

1. Remove Drain Collector Manifold Assembly
   A. Equipment And Materials Required

      Standard Tools:

Name	Manufacturer
Container, approximately 2 U.S. gallons (7.57 l)	Local Purchase

   B. Procedure
      See Figure 301.
      (1) Position container to catch residual fluids from drain tubes or manifold. Place protective covers on open ports and drain tubes when opened or removed.
      (2) Disconnect four drain lines from the right-hand side of the drain manifold.
      (3) Disconnect two drain lines from the tee at the forward end of the drain manifold.
      (4) Remove four bolts and washers attaching the drain manifold from the engine and remove the manifold.

POWER PLANT GENERAL − MAIN GEARBOX − REMOVAL−19

Task 71−00−61−050−019:

1. Remove Accessory Drain Tubing
   A. Prerequisites
      (1) Remove drain collector manifold assembly. See 71−00−61, Removal−18.
   B. Equipment And Materials Required

Standard Tools:

Name	Manufacturer
Container, approximately 2 U.S. gallons (7.57 l)	Local Purchase

C. Procedure

WARNING: BE CAREFUL WHEN DISCONNECTING OIL LINES OR DRAINING OIL FROM AN ENGINE THAT HAS RECENTLY BEEN SHUT DOWN. HOT OIL CAN CAUSE SERIOUS INJURY TO EYES AND SEVERELY BURN SKIN.

(1) Remove left side engine drain tubing. See Figure 301.

NOTE: Place protective covers on open ports and drain tubes during removal procedures.

Maintenance time can be reduced by temporarily installing clamps fingertight on the mounting brackets from which they were removed.

- (a) Disconnect clamp (301/19) from drain tube (301/34).
- (b) Disconnect and remove drain tube (301/34) from union (301/29) and union (301/11).
- (c) Remove union (301/11) and discard packing (301/5).
- (d) Disconnect clamp (301/19) and attaching parts from drain tube (301/33) and remove drain tube.

(2) Remove oil tank scupper drain tube. See Figure 301.
- (a) Disconnect and remove oil tank scupper drain tube (301/35) from union (301/11) and union (301/29).
- (b) Remove union (301/29) from bracket (301/30).
- (c) Remove union (301/11) from oil tank and discard packing (301/5).

(3) Remove integrated drive generator (IDG) drain tube. See Figure 301.
- (a) On IDG Port SD6, disconnect and remove IDG drain tube (301/32).
- (b) Remove union (301/11) from reducer (301/36) and discard packing (301/5).

(4) Remove starter drain tube. See Figure 302.

   - (a) On pneumatic engine starter, Port SD5, Flange K, disconnect and remove starter drain tube (302/19) from union (302/11).
   - (b) Remove union (302/11) from reducer (302/31) at Port SD5 and discard packing (302/5).
- (5) Remove fuel pump drain tube. See Figure 302.
   - (a) On fuel pump, Port SD2, Flange J, disconnect and remove fuel pump drain tube (302/28) from union (302/11).
   - (b) Remove union (302/11) from Port SD2 and discard packing (302/5).
- (6) Remove PMA drain tubing. See Figure 302.
   - (a) Disconnect and remove PMA drain tube (302/26) from PMA drain tube (302/27).
   - (b) Disconnect and remove clamp (302/25) and attaching hardware.
   - (c) Disconnect and remove PMA drain tube (302/27) from union (302/11) at drain Port SD8 (302/22).
   - (d) Remove union (302/11) and discard packing (302/5).
- (7) Remove hydraulic pumps drain tube. See Figure 303.
   - (a) Remove clamp (303/3) and attaching parts from hydraulic pumps drain tube (303/2).
   - (b) Disconnect and remove hydraulic pump drain tube (303/2) from union (303/11) at Port SD3 and union (303/11) at Port SD4.
   - (c) Remove union (303/11) from reducer (303/1) and discard packing (303/5).
   - (d) Remove union (303/11) from reducer (303/10) and discard packing (303/5).
- (8) Remove TCC cooling actuator drain tubing. See Figure 302.
   - (a) Disconnect and remove hose (302/1) from union (302/2) and 45 degrees elbow (302/17).
   - (b) Remove union (302/2) and discard packing (302/3).
   - (c) Remove clamp (302/7) and attaching parts from drain tube (302/4).
   - (d) Disconnect and remove drain tube (302/4) from 45 degrees elbow (302/17) and cross fitting (302/14).
   - (e) Remove clamp (302/7) and attaching parts from drain tube (302/15).
   - (f) Disconnect and remove drain tube (302/15) from cross fitting (302/14) and tee (302/24).
- (9) Remove engine vane bellcrank drain tube. See Figure 302.
   - (a) Disconnect and remove clamp (302/7) and attaching parts that secure electrical cable (302/32) to drain tube (302/12).

- (b) Remove clamp (302/7) and attaching parts that secure drain tube (302/12) to mounting bracket.
- (c) Disconnect and remove bellcrank drain tube (302/12) from union (302/11) and cross fitting (302/14).
- (d) Remove union (302/11) and discard packing (302/5).

(10) Remove air/oil cooler, integrated drive generator (IDG) actuator drain tube. See Figure 302.
- (a) Disconnect and remove air/oil cooler, IDG, drain tube (302/13) from union (302/11).
- (b) Remove cross fitting (302/14) from drain tube (302/13).
- (c) Remove union (302/11) and discard packing (302/5).

(11) Remove fuel/oil cooler, front fuel drain tube at Port AP24. See Figure 304.
- (a) Disconnect and remove drain tube (304/4) from union (304/11) and tee (304/25).
- (b) Remove union (304/11) and discard packing (304/5).

(12) Remove fuel/oil cooler bypass valve oil drain tube at Port AP30. See Figure 304.
- (a) Disconnect and remove drain tube (304/39) from union (304/11) and tee (304/40).
- (b) Remove union (304/11) and discard packing (304/5).

(13) Remove fuel/oil cooler IDG core fuel drain tube at Port AP21. See Figure 304.
- (a) Disconnect and remove tube (304/35) from elbow (304/17) and tee (304/37).
- (b) Remove elbow (304/17) and discard packing (304/5).

(14) Remove air/oil cooler, engine, drain tube. See Figure 304.
- (a) Disconnect and remove drain tube (304/34) from union (304/11) and tee (304/38).
- (b) Remove union (304/11) and discard packing (304/5).

(15) Remove fuel/oil cooler, rear fuel drain tubing at Port AP25. See Figure 304.
- (a) Remove clamp (304/19) and attaching parts on drain tube (304/24).
- (b) Disconnect and remove drain tube (304/24) from elbow (304/2) and union (304/11).
- (c) Remove elbow (304/2) and discard packing (304/5).
- (d) Remove union (304/11) from drain tube (304/32).
- (e) Remove clamp (304/41) and attaching parts from drain tube (304/32).
- (f) Disconnect and remove drain tube (304/32) from tee (304/42).

(16) Remove bleed actuator fuel drain. See Figure 304.
- (a) Remove clamp (304/19) and attaching parts from drain tube (304/33).

POWER PLANT GENERAL - MAIN GEARBOX - REMOVAL-25

Task 71-00-61-050-031:

1. Remove Fuel Pump Interstage Pressure Transmitter

   A. Equipment And Materials Required

   Standard Toos:
   Container, Approximately One U.S. Gallon (3.79 liter)
   Capacity, Suitable for Fuel

   B. Procedure

   See Figure 301.

   (1) Remove electrical connector DT581 from fuel pump interstage pressure transmitter (301/1).

   (2) Install protective covers on connector and receptacle.

   WARNING: ENGINE FUEL IS A FIRE HAZARD. AVOID SPILLAGE AND MAKE SURE THAT FIRE EXTINGUISHING EQUIPMENT IS READILY AVAILABLE AND IN PROXIMITY TO THE WORK AREA. REMOVE ANY SPILLED FUEL IMMEDIATELY.

   (3) Remove fuel tube assembly (301/2) from transmitter union (301/3) and drain residual fuel into suitable container.

   (4) Install protective covers on fuel tube coupling nut and transmitter union.

   (5) Remove two screws (301/4) and washers (301/5) securing wire harness support bracket (301/6) and forward mounting flange of transmitter to transmitter support bracket.

   (6) Remove transmitter (301/1) from transmitter support bracket by removing remaining two screws (301/7), washers (301/8) and nuts (301/9) from aft mounting flange.

Task 71−00−61−050−032:

1. Remove Oil Temperature Sensor

    A. Equipment And Materials Required − None

    B. Procedure

    See Figure 301.

    (1) Disconnect electrical connector DT592 from sensor.

    (2) Remove oil temperature sensor and packing from bottom of main gearbox. Discard packing.

    (3) Install protective covers on electrical connector and open port.

Task 71-00-61-050-033:

1. Remove No. 3 Bearing Oil Temperature Sensor (Immersion Thermocouple)

   A. Equipment And Materials Required - None

   B. Procedure

   See Figure 301.

   (1) Disconnect electrical connector DT597 from sensor.

   (2) Remove oil temperature sensor from LT2 port in No. 3 bearing scavenge line. Discard packing.

   (3) Install protective covers on electrical connector and open LT2 port.

Task 71-00-61-050-034:

1. Remove IDG Starter, And Hydraulic Pump Heat Shields

A. Equipment And Materials Required - None

B. Procedure

See Figure 301.

(1) Remove two sets of screws and four washers securing IDG heat shield to support brackets.

(2) Remove screws and washers securing starter heat shield to support brackets.

(3) Remove screws and washers securing hydraulic pump heat shield to support brackets.

(4) Remove IDG, starter, and hydraulic pump heat shields from engine.

Task 71-00-61-050-035:

1. Remove Starter Control Valve Cooling Tube And Hose

A. Equipment And Materials Required - None

B. Procedure

See Figure 301.

(1) At lower end of ignition cooling duct, disconnect coupling nut of starter control valve cooling tube from ignition cooling duct.

(2) Remove clamp, screw, washer, and nut securing lower end of starter control valve cooling tube to bracket on Flange M.

(3) Disconnect clamp securing cooling hose to starter control valve cooling tube. Remove cooling tube from engine.

(4) Disconnect clamp securing lower end of cooling hose to starter control valve.

Task 71-00-61-050-036:

1. Remove EEC Alternator (PMA) Cooling Hose And Tubes

   A. Equipment And Materials Required - None

   B. Procedure

      See Figure 301.

      (1) Disconnect clamp securing hose (301/10) to PMA cooling shroud.

      (2) Disconnect clamp securing hose to tube (301/7).

      (3) Loosen and disengage coupling nut securing tube (301/7) to duct (301/2).

      (4) Disconnect clamp securing tube (301/7) near bracket on starter pad.

      (5) Disconnect clamp securing opposite end of duct (301/2).

      (6) Disconnect clamp securing cooling duct to bracket.

      (7) Disengage snap retainer. loosen connector body and coupling nut securing TCC duct to ignition cooling duct.

      (8) Remove connector coupling body, coupling nut, two washers, packings and snap retainer from ignition cooling duct and TCC duct. Discard packings.

A. Equipment And Materials Required − None

B. Procedure

See Figure 301.

(1) Disconnect two clamps (301/12) securing hose (301/13) to tube (301/10) and to oil quantity transmitter cooling shroud.

(2) Disconnect clamps, screws, washers, and nuts securing tube (301/10) to two brackets.

(3) Disconnect coupling nut securing tube (301/10) to nipple on oil quantity transmitter tube (301/2).

(4) Disconnect clamps, screws, washers, and nuts securing oil quantity transmitter tube to two brackets.

(5) Disconnect clamps securing hose (301/7) to cooling air supply tube and forward end of oil quantity transmitter tube (301/2).

(6) Disconnect tube (301/2) connector coupling body from TRC valve. Discard connector packings.

Figure 301
(Task 71-00-61-050-038)

Task 71-00-61-450-001:

1. Install Hydraulic Hoses (Abex Pump)

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
R P06-054	Paste, Anti-Seize (PWA 36246)

B. Procedure
See Figure 401, Figure 402 and Figure 403.

(1) Install upper hose support bracket with four bolts, washers and nuts. Torque nuts 85 - 95 lb-in. (9.604 - 10.734 N.m).

R (2) Apply Anti-Seize Paste P06-054 to the screws and install the lower hose support bracket with three screws and washers. Remove the unwanted paste. Torque screws 62 - 72 lb-in. (7.005 - 8.135 N.m).

(3) Install rear hydraulic pump lower case drain hose.

(a) Connect hose to reducer in rear hydraulic pump case drain port. Torque hose coupling nut to 215 - 245 lb-in. (24.292 - 27.681 N.m).

(b) Connect hose to union on side of rear case hydraulic filter. Torque hose coupling nut to 215 - 245 lb-in. (24.292 - 27.681 N.m).

(4) Install rear hydraulic pump upper case drain hose with male connectors to the pylon and the rear hydraulic pump.

(a) Connect hose to union on top of rear case hydraulic filter. Torque hose coupling nut to 215 - 245 lb-in. (24.292 - 27.681 N.m).

(b) Connect hose to fluid disconnect panel. Torque hose coupling nut to 215 - 245 lb-in. (24.292 - 27.681 N.m).

(c) Attach hose to upper hose support bracket with clamp block (401/1).

1 Open left hand clamp band and insert hose into clamp block.

2 Close clamp band. Do not tighten clamp block at this time.

(5) Install rear hydraulic pump pressure hose.

(a) Connect hose to pulsation dampener on rear hydraulic pump pressure port. Torque hose coupling nut to 900 − 1150 lb−in. (101.686 − 129.932 N.m).

(b) Connect hose to fluid disconnect panel. Torque hose coupling nut to 900 − 1150 lb−in. (101.686 − 129.932 N.m).

(c) Attach hose to hydraulic filter bracket with clamp (401/2) and attaching hardware. Do not tighten clamp at this time.

(d) Attach hose to upper hose support bracket with clamp (401/2) and attaching hardware. Do not tighten clamp at this time.

(6) Install rear hydraulic pump suction hose.

(a) Connect hose to adapter in rear hydraulic pump suction port. Torque hose coupling nut to 1900 − 2100 lb−in. (214.671 − 237.268 N.m).

(b) Connect hose to fluid disconnect panel. Torque hose coupling nut to 1900 − 2100 lb−in. (214.671 − 237.268 N.m).

(c) Attach hose to hydraulic filter bracket with clamp (401/3) and attaching hardware. Do not tighten clamp at this time.

(d) Attach hose to upper hose support bracket with clamp (401/3) and attaching hardware. Do not tighten clamp at this time.

(7) Collect three hoses: rear hydraulic pump lower case drain hose, rear hydraulic pump pressure hose, and rear hydraulic pump suction hose. Secure the hoses with clamp (401/4) and attaching hardware. Torque nut to 50 − 70 lb−in. (5.649 − 7.909 N.m).

(8) Install front hydraulic pump lower case drain hose.

  (a) Connect hose to reducer in front hydraulic pump case drain port. Torque hose coupling nut to 215 − 245 lb−in. (24.292 − 27.681 N.m).

  (b) Connect hose to union on side of front hydraulic filter. Torque hose coupling nut to 215 − 245 lb−in. (24.292 − 27.681 N.m).

  (c) Attach hose to lower hose support bracket with clamp (402/5) and attaching hardware. Do not tighten clamp at this time.

(9) Install front hydraulic pump upper case drain hose.

  (a) Connect hose to union on top of front hydraulic filter. Torque hose coupling nut to 215 − 245 lb−in. (24.292 − 27.681 N.m).

  (b) Connect hose to fluid disconnect panel. Torque to 215 − 245 lb−in. (24.292 − 27.681 N.m).

  (c) Attach hose to upper hose support bracket with clamp block (401/1).

    1 Open right hand clamp band and insert hose into clamp block.

    2 Close clamp band. Torque screw 50 − 70 lb−in. (5.649 − 7.909 N.m).

    3 Secure clamp block (401/1) with bolt and washer and torque to 50 − 70 lb−in. (5.649 − 7.909 N.m).

(10) Install front hydraulic pump pressure hose.

  (a) Connect hose to pulsation dampener on front hydraulic pump pressure port. Torque hose coupling nut to 900 − 1150 lb−in. (101.686 − 129.932 N.m).

  (b) Connect hose to fluid disconnect panel. Torque hose coupling nut to 900 − 1150 lb−in. (101.686 − 129.932 N.m).

(c) Attach hose to lower hose support bracket with clamp (402/6) and attaching hardware. Do not tighten clamp at this time.

(d) On lower case drain hose, measure 8.7 inch (221.0 mm) from fitting at end of flexible part of hose. At this point, attach pressure hose to lower case drain hose with two clamps (402/5 and 402/7) and attaching hardware. Torque nut to 50 − 70 lb−in. (5.649 − 7.909 N.m).

(e) Attach hose to hydraulic filter bracket with clamp (401/2) and attaching hardware. Do not tighten clamp at this time.

(f) Attach hose to upper hose support bracket with clamp (401/3) and attaching hardware. Do not tighten clamp at this time.

(11) Install front hydraulic pump suction hose.

(a) Connect hose to adapter on front hydraulic pump suction port. Torque hose coupling nut to 1900 − 2100 lb−in. (214.671 − 237.268 N.m).

(b) Connect hose to fluid disconnect panel. Torque hose coupling nut to 1900 − 2100 lb−in. (214.671 − 237.268 N.m).

(c) Attach hose to lower hose support bracket with clamp (402/8) and attaching hardware. Do not tighten clamp at this time.

(d) At outside horizontal section of hydraulic suction hose, measure 7.0 inch (177.8 mm) from aft right angle bend. At this point, attach pressure hose to suction hose with two clamps (402/7 and 402/9) and attaching hardware. Torque nut to 50 − 70 lb−in. (5.649 − 7.909 N.m).

(e) Attach hydraulic suction hose to hydraulic filter bracket with clamp (401/3) and attaching hardware. Do not tighten clamp at this time.

(f) Attach hose to upper hose support bracket with clamp (401/3) and attaching hardware. Do not tighten clamp at this time.

(12) Adjust hoses and tighten nuts holding three clamps on lower hose support bracket. Torque nuts to 50 − 70 lb−in. (5.649 − 7.909 N.m).

(13) Collect three hoses: front hydraulic pump lower case drain hose, hydraulic pressure hose and hydraulic suction hose with clamp (401/9) and attach clamp to support bracket on main gearbox with attaching hardware. Torque nuts to 50 − 70 lb−in. (5.649 − 7.909 N.m).

(14) On front hydraulic pump suction hose, measure 13.0 inch (330.2 mm) below clamp (403/9) on gearbox support bracket. Collect three hoses: hydraulic suction hose, pressure hose and lower case drain hose with clamp (403/10) and secure with attaching hardware. Torque nut to 50 − 70 lb−in. (5.649 − 7.909 N.m).

(15) On front hydraulic suction hose, measure 17.8 inch (452.1 mm) above support clamp (403/9) on gearbox. Collect three hoses; hydraulic suction hose, pressure hose and lower case drain hose with clamp (403/11) and secure with attaching hardware. Torque nut to 50 − 70 lb−in. (5.649 − 7.909 N.m).

(16) Adjust hoses and tighten nuts holding two clamps on hydraulic filter bracket. Torque nuts to 50 − 70 lb−in. (5.649 − 7.909 N.m).

(17) Adjust hoses and tighten nuts holding two clamps on upper hydraulic hose support bracket. Torque nuts to 50 − 70 lb−in. (5.649 − 7.909 N.m).

Task 71-00-61-450-002:

1. Install Hydraulic Hoses (Sperry-Vickers Pump)

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
R P06-054	Paste, Anti-Seize (PWA 36246)

B. Procedure
See Figure 401, Figure 402 and Figure 403.

(1) Install upper hose support bracket with four bolts, washers and nuts. Torque nuts 85 - 95 lb-in. (9.604 - 10.734 N.m).

R R R (2) Apply Anti-Seize Paste P06-054 to the screws and install the lower hose support bracket with three screws and washers. Remove the unwated paste. Torque screws 62 - 72 lb-in. (7.005 - 8.135 N.m).

(3) Install rear hydraulic pump lower case drain hose.

(a) Connect hose to reducer in rear hydraulic pump case drain port. Torque hose coupling nut to 215 - 245 lb-in. (24.292 - 27.681 N.m).

(b) Connect hose to union on side of rear case hydraulic filter. Torque hose coupling nut to 215 - 245 lb-in. (24.292 - 27.681 N.m).

(4) Install rear hydraulic pump upper case drain hose.

(a) Connect hose to union on top of rear case hydraulic filter. Torque hose coupling nut to 215 - 245 lb-in. (24.292 - 27.681 N.m).

(b) Connect hose to fluid disconnect panel. Torque hose coupling nut to 215 - 245 lb-in. (24.292 - 27.681 N.m).

(c) Attach hose to upper hose support bracket with clamp block (401/1).

1 Open left hand clamp band and insert hose into clamp block.

2 Close clamp band. Do not tighten clamp block at this time.

(5) Install rear hydraulic pump pressure hose.

(a) Connect hose to reducer in rear hydraulic pump pressure port. Torque hose coupling nut to 900 − 1150 lb−in. (101.686 − 129.932 N.m).

(b) Connect hose to fluid disconnect panel. Torque hose coupling nut to 900 − 1150 lb−in. (101.686 − 129.932 N.m).

(c) Attach hose to hydraulic filter bracket with clamp (401/2) and attaching hardware. Do not tighten clamp at this time.

(d) Attach hose to upper hose support bracket with clamp (401/2) and attaching hardware. Do not tighten clamp at this time.

(6) Install rear hydraulic pump suction hose.

(a) Connect hose to adapter in rear hydraulic pump suction port. Torque hose coupling nut to 1900 − 2100 lb−in. (214.671 − 237.268 N.m).

(b) Connect hose to fluid disconnect panel. Torque hose coupling nut to 1900 − 2100 lb−in. (214.671 − 237.268 N.m).

(c) Attach hose to hydraulic filter bracket with clamp (401/3) and attaching hardware. Do not tighten clamp at this time.

(d) Attach hose to upper hose support bracket with clamp (401/3) and attaching hardware. Do not tighten clamp at this time.

(7) Collect three hoses: rear hydraulic pump lower case drain hose, rear hydraulic pump pressure hose, and rear hydraulic pump suction hose. Secure the hoses with clamp (401/4) and attaching hardware. Torque nut to 50 − 70 lb−in. (5.649 − 7.909 N.m).

(8) Install front hydraulic pump lower case drain hose.

(a) Connect hose to reducer in front hydraulic pump case drain port. Torque hose coupling nut to 215 − 245 lb−in. (24.292 − 27.681 N.m).

(b) Connect hose to union on side of front hydraulic filter. Torque hose coupling nut to 215 − 245 lb−in. (24.292 − 27.681 N.m).

(c) Attach hose to lower hose support bracket with clamp (402/5) and attaching hardware. Do not tighten clamp at this time.

(9) Install front hydraulic pump upper case drain hose.

(a) Connect hose to union on top of front hydraulic filter. Torque hose coupling nut to 215 − 245 lb−in. (24.292 − 27.681 N.m).

(b) Connect hose to fluid disconnect panel. Torque to 215 − 245 lb−in. (24.292 − 27.681 N.m).

(c) Attach hose to upper hose support bracket with clamp block (401/1).

1 Open right hand clamp band and insert hose into clamp block.

2 Close clamp band. Torque screw 50 − 70 lb−in. (5.649 − 7.909 N.m).

3 Secure clamp block (401/1) with bolt and washer and torque to 50 − 70 lb−in. (5.649 − 7.909 N.m).

(10) Install front hydraulic pump pressure hose.

(a) Connect hose to reducer in front hydraulic pump pressure port. Torque hose coupling nut to 900 − 1150 lb−in. (101.686 − 129.932 N.m).

(b) Connect hose to fluid disconnect panel. Torque hose coupling nut to 900 − 1150 lb−in. (101.686 − 129.932 N.m).

(c) Attach hose to lower hose support bracket with clamp (402/6) and attaching hardware. Do not tighten clamp at this time.

(d) On lower case drain hose, measure 8.7 inch (221.0 mm) from fitting at end of flexible part of hose. At this point, attach pressure hose to lower case drain hose with two clamps (402/5 and 402/7) and attaching hardware. Torque nut to 50 − 70 lb−in. (5.649 − 7.909 N.m).

(e) Attach hose to hydraulic filter bracket with clamp (401/2) and attaching hardware. Do not tighten clamp at this time.

(f) Attach hose to upper hose support bracket with clamp (401/3) and attaching hardware. Do not tighten clamp at this time.

(11) Install front hydraulic pump suction hose.

(a) Connect hose to adapter on front hydraulic pump suction port. Torque hose coupling nut to 1900 − 2100 lb−in. (214.671 − 237.268 N.m).

(b) Connect hose to fluid disconnect panel. Torque hose coupling nut to 1900 − 2100 lb−in. (214.671 − 237.268 N.m).

(c) Attach hose to lower hose support bracket with clamp (402/8) and attaching hardware. Do not tighten clamp at this time.

(d) At outside horizontal section of hydraulic suction hose, measure 7.0 inch (177.8 mm) from aft right angle bend. At this point, attach pressure hose to suction hose with two clamps (402/7 and 402/9) and attaching hardware. Torque nut to 50 − 70 lb−in. (5.649 − 7.909 N.m).

(e) Attach hydraulic suction hose to hydraulic filter bracket with clamp (401/3) and attaching hardware. Do not tighten clamp at this time.

(f) Attach hose to upper hose support bracket with clamp (401/3) and attaching hardware. Do not tighten clamp at this time.

(12) Adjust hoses and tighten nuts holding three clamps on lower hose support bracket. Torque nuts to 50 − 70 lb−in. (5.649 − 7.909 N.m).

POWER PLANT GENERAL − MAIN GEARBOX − INSTALLATION−02

(13) Collect three hoses: front hydraulic pump lower case drain hose, hydraulic pressure hose and hydraulic suction hose with clamp (401/9) and attach clamp to support bracket on main gearbox with attaching hardware. Torque nuts to 50 − 70 lb−in. (5.649 − 7.909 N.m).

(14) On front hydraulic pump suction hose, measure 13.0 inch (330.2 mm) below clamp (403/9) on gearbox support bracket. Collect three hoses: hydraulic suction hose, pressure hose and lower case drain hose with clamp (403/10) and secure with attaching hardware. Torque nut to 50 − 70 lb−in. (5.649 − 7.909 N.m).

(15) On front hydraulic suction hose, measure 17.8 inch (452.1 mm) above support clamp (403/9) on gearbox. Collect three hoses; hydraulic suction hose, pressure hose and lower case drain hose with clamp (403/11) and secure with attaching hardware. Torque nut to 50 − 70 lb−in. (5.649 − 7.909 N.m).

(16) Adjust hoses and tighten nuts holding two clamps on hydraulic filter bracket. Torque nuts to 50 − 70 lb−in. (5.649 − 7.909 N.m).

(17) Adjust hoses and tighten nuts holding two clamps on upper hydraulic hose support bracket. Torque nuts to 50 − 70 lb−in. (5.649 − 7.909 N.m).

POWER PLANT GENERAL - MAIN GEARBOX - INSTALLATION-03

Task 71-00-61-450-003:

1. Install Starter Shutoff Valve
   A. Prerequisites
      (1) Install starter assembly. See Installation-14. (Task 71-00-61-450-014)
   B. Equipment And Materials Required

      Consumable Materials:

Item No.	Designation
P06-013	Lubricant, Solid Film

   C. Procedure
      See Figure 401.
      (1) Install starter lower-forward duct.
         (a) Lubricate inside surface of duct coupling with Material P06-013.
         (b) Position duct against starter, fitting key on duct to keyslot on starter. Place coupling seal between mating flanges.
         (c) Verify that outside diameters of mating flanges are aligned radially within 0.06 inch (1.524 mm), and angular gap between mating faces of flanges is not greater than 0.04 inch (1.016 mm).
         (d) Attach duct to starter with coupling. Tighten coupling fingertight.
      (2) Install starter shutoff valve.
         (a) Lubricate inside surface of duct coupling wiht Material P06-013.
         (b) Position valve against lower-forward duct, fitting key on valve to keyslot on duct. Place coupling seal between mating flanges.
         (c) Verify that outside diameters of mating flanges are aligned radially within 0.06 inch (1.524 mm), and angular gap between mating faces of flanges is not greater than 0.04 inch (1.016 mm).
         (d) Attach valve to duct with coupling. Tighten coupling fingertight.
         (e) Lubricate inside surface of duct coupling with Material P06-013.
         (f) Position valve against starter lower duct. Place seal between mating flanges.
         (g) Verify that outside diameters of mating flanges are aligned radially within 0.06 inch (1.524 mm), and angular gap between mating faces of flanges is not greater than 0.04 inch (1.016 mm).
         (h) Attach valve to duct with coupling. Tighten coupling fngertight.

(i) Torque three couplings to values marked on each coupling. Tap around coupling with plastic mallet. Retorque coupling.
(j) Connect electrical connector to shutoff valve. Tighten connector fingertight plus one−eighth turn.

POWER PLANT GENERAL - MAIN GEARBOX - INSTALLATION-04

Task 71-00-61-450-004:

1. Install Integrated Drive Generator (IDG)

A. Equipment And Materials Required

Special Tools:
RSE1001-1 Accessory Hoist (Optional to RSE1110)
RSE1110 IDG Hoist Support

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Packing	1		TBD	

B. Procedure

See Figure 401.

(1) Remove protective covers from end of IDG, from two oil supply tube ports, and from two electrical receptacles.

(2) Position IDG on Hoist RSE1110 or RSE1001-1 with "open position" mark (narrow groove near alignment pin) on bottom and tighten holding strap securing IDG to hoist.

(3) Lubricate new packing with Engine Oil (P03-001), and install packing on IDG driveshaft.

(4) Adjust IDG adapter coupling to line up the "open position" marks at bottom of QAD adapter plate and coupling.

(5) Align guide pin on IDG (lower outboard) with alignment hole on QAD adapter plate.

(6) Move IDG against QAD adapter plate. Engage splines on IDG driveshaft with splines in gearbox shaft. Fit IDG guide pin in adapter alignment hole. Pass IDG flange tabs between adapter coupling flange tabs.

(7) Tighten adapter coupling tension bolt to lock IDG and adapter flange tabs together.

(8) Torque adapter coupling tension bolt to 240 - 268 lb-in. (27.116 - 30.280 N.m). Tap around adapter coupling with plastic mallet. Retorque coupling tension bolt. Repeat tapping and retorque.

(9) Remove accessory hoist.

(10) Lubricate unions in IDG oil-in port and oil-out port with Engine Oil (P03-001).

POWER PLANT GENERAL − MAIN GEARBOX − INSTALLATION−04

(11) Connect oil supply tubes to IDG oil−in and oil−out ports. Torque tube fittings 900 − 1000 lb−in. (101.686 − 112.985 N.m).
(12) Remove screws and washers attaching cover over generator output wire terminal strip.
(13) Remove nuts and washers on four studs of generator output terminal strip.
(14) Connect four generator output wires to four studs of IDG generator output terminal strip.
(15) Install nuts and washers attaching four generator output wires to four studs of generator output terminal strip. Torque nuts to 144 − 168 lb−in. (16.270 − 18.981 N.m).
(16) Install two bolts and washers attaching cover over generator output terminal strip. Torque screws to 20 − 22 lb−in. (2.260 − 2.486 N.m).
(17) Connect two electrical connectors, DG13A and DG13B, to IDG receptacles. Tighten connectors fingertight plus one−eighth turn.

NOTE: Attach placard to IDG indicating that IDG must be serviced in accordance with instructions in Airbus Industrie Maintenance Manual, Chapter 12−13−24, before engine is run.

POWER PLANT GENERAL − MAIN GEARBOX − INSTALLATION−05

Task 71−00−61−450−005:

1. Install IDG Quick−Attach−Detach (QAD) Adapter
   - A. Equipment And Materials Required − None
   - B. Procedure
     See Figure 401.
     - (1) Position QAD adapter and gasket against main gearbox with word TOP uppermost.
     - (2) Install eight mounting bolts attaching QAD adapter and gasket to main gearbox.
     - (3) Torque bolts to 276 − 300 lb−in. (31.184 − 33.895 N.m).
   - C. Postrequisites
     - (1) Install Integrated Drive Generator (IDG). See Installation−04 (Task 71−00−61−450−004).

Task 71-00-61-450-006:

1. Install Main Fuel Supply Line

A. Equipment And Materials Required

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P05-262	Lockwire (MS20995C32)
P05-289	Lockwire (AS3214-02) (Optional)
P05-291	Safety Cable (Optional)
P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	2	TBD

B. Procedure

See Figure 401.

(1) Install four bolts and washers attaching fuel supply hose and new gasket to pylon interface panel. Torque bolts 75 - 85 lb-in. (8.474 - 9.604 N.m). Lockwire four bolts.

(2) Install two bolts and washers attaching hose clamp and hose to TCC duct bracket.

(3) Remove three existing bolts and washers from turbine cooling valve flange. Using same bolts and washers, attach hose lower support bracket, with hose, to turbine cooling valve flange. Torque bolts 85 - 95 lb-in. (9.604 - 10.734 N.m).

R R R (4) Install four bolts and washers attaching fuel supply hose and new gasket to fuel pump inlet. Torque the bolts to 180 - 200 lb-in. (20.337 - 22.597 N.m). Safety the four bolts with Lockwire P05-262, Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

POWER PLANT GENERAL − MAIN GEARBOX − INSTALLATION−07

Task 71−00−61−450−007:

1. Install Low Oil Pressure Switch And Oil Pressure Transmitter
   - A. Equipment And Materials Required − None
   - B. Procedure

     See Figure 401.
     - (1) Install instrument mounting bracket.
       - (a) Remove two bolts and washers from oil filter.
       - (b) Remove two bolts and washers from oil filter inlet flange.
       - (c) Install two bolts and washers attaching oil low pressure switch and oil pressure transmitter mounting bracket to oil filter. Torque bolts 75 − 85 lb−in. (8.474 − 9.604 N.m).
       - (d) Install two bolts and washers attaching oil low pressure switch and oil pressure transmitter mounting bracket to oil filter inlet flange. Torque bolts 75 − 85 lb−in. (8.474 − 9.604 N.m).
     - (2) Connect pressure tubes.
       - (a) Connect pressure tube to top of low oil pressure warning switch.
       - (b) Connect pressure tube to bottom of oil pressure transmitter.
       - (c) Connect pressure tube to top of tee on top of oil pressure transmitter.
       - (d) Torque three tube connections 107 − 117 lb−in. (12.089 − 13.219 N.m).
     - (3) Connect electrical connectors.
       - (a) Connect electrical connector to top of oil pressure transmitter.
       - (b) Connect electrical connector to low oil pressure warning switch.
       - (c) Tighten two electrical connectors fingertight plus one−eighth turn.

POWER PLANT GENERAL - MAIN GEARBOX - INSTALLATION-09

Task 71-00-61-450-009:

1. Install Engine Core Compartment Temperature Sensor
    - A. Equipment And Materials Required - None
    - B. Procedure

      See Figure 401.
        - (1) Remove two bolts from front hydraulic pump base on gearbox.
        - (2) Using same bolts, attach core compartment temperature sensor support bracket to gearbox. Torque bolts 275 - 300 lb-in. (31.071 - 33.895 N.m).
        - (3) Connect electrical connector DT595.
        - (4) Tighten electrical connector fingertight plus one-eighth turn.

POWER PLANT GENERAL − MAIN GEARBOX − INSTALLATION−10

Task 71−00−61−450−010:

1. Install Engine Oil Tank Pressure Fill System

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Packing	1		TBD	
Packing	1		TBD	

B. Procedure

See Figure 401.

(1) Lubricate new packing with Material P03−001 and install packing and coupling in oil tank pressure overfill port. Torque coupling 215 − 240 lb−in. (24.292 − 27.116 N.m).

(2) Lubricate new packing with Material P03−001 and install packing and coupling in oil tank pressure fill port. Torque coupling 125 − 140 lb−in. (14.123 − 15.818 N.m).

(3) Install dust covers on pressure overfill coupling and on pressure fill coupling.

(4) Install bolt, washer and nut attaching oil pressure fill/overfill dust cover retaining cords clamp to oil tank scupper drain tube.

POWER PLANT GENERAL – MAIN GEARBOX – INSTALLATION–11

Task 71–00–61–450–011:

1. Install Oil Quantity Transmitter

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03–001	Oil, Engine

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Packing	1		TBD	

B. Procedure

See Figure 401.

(1) Lubricate new packing with Engine Oil (P03–001) and install packing on oil quantity transmitter.

(2) Install transmitter, with cover, and heat shield bracket (Post SB PW4ENG 79–74) in oil tank and attach with six bolts, washers and nuts. Torque nuts to 75 – 85 lb–in. (8.474 – 9.604 N.m).

(3) Connect electrical connector.

(4) Tighten electrical connector fingertight plus one–eighth turn.

Task 71-00-61-450-012:

1. Install Front Hydraulic Pump

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P02-001	Fluid, Hydraulic
P03-001	Oil, Engine

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Gasket	1	29-11-01	1	580
Packing	1	29-11-01	1	520

B. Procedure
See Figure 401.

- (1) Install pump.
  - (a) Lubricate packing with Engine Oil (P03-001) and install packing on pump shaft.
  - (b) Install new gasket over studs on pump mounting base on gearbox.
  - (c) Lubricate four mounting studs on pump base with Engine Oil (P03-001) and install nuts loosely on tips of studs.
  - (d) Support pump on mounting base with pump electrical connector pointing to lower-outboard.
  - (e) Position pump on mounting studs so mounting nuts pass through enlarged ends of pump mounting slots.
  - (f) Rotate pump counterclockwise to engage nuts. Torque nuts 260 - 320 lb-in. (29.376 - 36.155 N.m).
- (2) Connect electrical and hydraulic connectors.
  - (a) Lubricate case drain reducer (attached to pump) with Hydraulic Fluid (P02-001). Connect case drain hose to reducer. Torque hose coupling 215 - 245 lb-in. (24.292 - 27.681 N.m).
  - (b) Lubricate suction hose adapter (attached to pump) with Material P02-001. Connect suction hose to adapter. Torque hose coupling 1900 - 2100 lb-in. (214.671 - 237.268 N.m).
  - (c) Lubricate pressure hose union (Sperry-Vickers) or dampener fitting (Abex), attached to pump, with Hydraulic Fluid (P02-001). Connect pressure hose to union or dampener. Torque hose coupling 900 - 1150 lb-in. (101.686 - 129.932 N.m).

Task 71-00-61-450-013:

1. Install Rear Hydraulic Pump

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P02-001	Fluid, Hydraulic
P03-001	Oil, Engine

Expendable Parts:

PART NAME	QUANTITY	POWER PLANT PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	29-11-01/1/580
Packing	1	29-11-01/1/520

B. Procedure
See Figure 401.

(1) Install pump.

(a) Lubricate new packing with Engine Oil P03-001 and install packing on pump shaft.

(b) Install new gasket over studs on pump mounting base on gearbox.

(c) Lubricate four mounting studs on pump base with Engine Oil P03-001 and install nuts loosely on tips of studs.

(d) Support pump on mounting base with pump electrical connector pointing outboard.

(e) Position pump on mounting studs so mounting nuts pass through enlarged ends of pump mounting slots.

(f) Rotate pump counterclockwise to engage nuts. Torque nuts 260 - 320 lb-in. (29.376 - 36.155 N.m).

(2) Connect electrical and hydraulic connectors.

(a) Lubricate case drain reducer (attached to pump) with Hydraulic Fluid P02-001. Connect case drain hose to reducer. Torque hose coupling 215 - 245 lb-in. (24.292 - 27.681 N.m).

(b) Lubricate suction hose adapter (attached to pump) with Material P02−001. Connect suction hose to adapter. Torque hose coupling 1900 − 2100 lb−in. (214.671 − 237.268 N.m).

(c) Lubricate pressure hose union (Sperry−Vickers) or dampener fitting (Abex), attached to pump, with Hydraulic Fluid P02−001. Connect pressure hose to union or dampener. Torque hose coupling 900 − 1150 lb−in. (101.686 − 129.932 N.m).

POWER PLANT GENERAL - MAIN GEARBOX - INSTALLATION-14

Task 71-00-61-450-014:

1. Install Starter Assembly

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine
P06-020	Lubricant, Bolt
P06-059	Lubricant, Fluorinated Grease (PWA 36230)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	TBD
Packing	1	TBD

B. Procedure
See Figure 401.

(1) Install starter quick-attach-detach (QAD) adapter.

(a) Coat six bolts with Lubricant P06-020.

(b) Position gasket and adapter, with double tooth of adapter inner mounting flange up, against starter adapter mounting base on main gearbox.

(c) Install six bolts and washers attaching adapter and gasket to main gearbox. Torque bolts 138 - 150 lb-in. (15.592 - 16.948 N.m).

(2) Install starter

(a) Lubricate packing with Engine Oil P03-001.

(b) Install packing on starter driveshaft.

CAUTION: Before you apply Fluorinated Grease Lubricant to the starter driveshaft splines, make sure the starter splines and gearbox splines are clean and not damaged. Apply Fluorinated Grease Lubricant to the starter driveshaft splines to reduce wear and increase service life of the parts.

(c) Apply Fluorinated Grease Lubricant P06−059 to the starter driveshaft splines.

(d) Position starter to adapter with double tooth of forward mounting flange up. Align starter driveshaft splines with splines in main gearbox. Press starter against adapter.

(e) Install coupling attaching starter to QAD adapter. Torque coupling bolt 60 − 65 lb−in. (6.779 − 7.344 N.m).

POWER PLANT GENERAL - MAIN GEARBOX - INSTALLATION-15

Task 71-00-61-450-015:

1. Install Chip Detectors

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	4	TBD
Packing	1	TBD
Lockwire, MS20995C32		

B. Procedure
See Figure 401.

(1) Install four chip detectors.

(a) Lubricate packing with Material P03-001. Install packing on chip detector.

(b) Install chip detector in bottom of oil pump. Torque chip detector to 32 - 40 lb-in. (3.616 - 4.519 N.m).

(c) Install lockwire to chip detector.

(2) Install master chip detector.

(a) Lubricate packing with Material P03-001. Install packing on master chip detector.

(b) Install master chip detector in forward edge of main gearbox. Torque master chip detector to 87 - 108 lb-in. (9.830 - 12.202 N.m).

(c) Install lockwire to master chip detector.

C. Postrequisites

(1) Test engine by the Test Reference Table. See 71-00-00, Testing-00 Task 71-00-00-990-003.

Task 71-00-61-450-017-001:

1. Install HP Fuel Shutoff Valve Actuator (PN 221D4003-507)

A. Equipment And Materials Required

Special Tools:
RSE1041-1 Rig Pin

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Lockwire, MS20995C32				

B. Procedure
See Figure 401.

NOTE: The HP fuel shutoff actuator is installed and rigged in the "RUN" position.

(1) Rotor fuel metering unit (FMU) condition shaft from "OFF" position to "RUN" position.
(2) Install RSE1041-1 Rig Pin through rig pin hole on FMU into rigging slot of condition shaft cam.
(3) Remove protective covers and connect electrical connector DH10 to actuator. Tighten connector fingertight only at this time. See Figure 402.

CAUTION: DO NOT ATTEMPT TO MANUALLY ROTATE THE HP FUEL SHUTOFF VALVE ACTUATOR MOTOR TO THE "RUN" POSITION.

(4) Energize HP fuel shutoff valve actuator motor to run from "OFF" position to "RUN" position.

NOTE: If aircraft electrical power is not available at connector DH10, use an external power source of 28 volts DC and connect the terminals to the following pins:

Pin No. 5	Negative terminal

Connect positive terminal, in sequence, to the following pins:

Pin No. 1	Selects to "OFF" position
Pin No. 3	Selects to "RUN" position

(5) Verify that actuator is in "RUN" position.

CAUTION: VERIFY THAT SHIM (SB PW4 73−2), WHICH PREVENTS INTERFERENCE BETWEEN FUEL METERING UNIT SHAFT AND FUEL SHUTOFF VALVE ACTUATOR SHAFT, IS INSTALLED ON ADAPTER ASSEMBLY.

(6) Install adapter assembly on FMU with three bolts and washers. Torque bolts to 20 − 25 lb−in. (2.260 − 2.825 N.m).

(7) Install HP fuel shutoff valve actuator on FMU adapter.
  (a) Align splines of shutoff valve condition shaft with socket splines of actuator and position actuator on adapter.
  (b) Check attaching bolt hole alignment between actuator and adapter. If the three bolt holes are not aligned, loosen self−locking nut on actuator position indicator and remove lockwire from indicator adjustment screw. Turn adjustment screw until holes align. Lockwire adjustment screw and tighten self−locking nut on actuator position indicator.
  (c) Install three bolts and washers. Torque bolts to 50 − 70 lb−in. (5.6 − 6.9 N.m) and lockwire.

(8) Remove rig pin from FMU.

(9) Energize fuel shutoff valve actuator motor to rotate from "RUN" position to "OFF" position and back to "RUN" position.
  (a) Check that rig pin can be inserted at "RUN" position. Verify that actuator rotates to "OFF" position.
  (b) If rig pin cannot be inserted at "RUN" position when selected, recheck installation for proper assembly and repeat previous steps.

(10) If aircraft electrical power is not available to connector DH10, use an external power source of 28 volts DC and perform the following steps.
  (a) Connect negative terminal to Pin No. 5 of actuator receptacle.
  (b) Connect positive terminal to Pin No. 1 to select actuator to "OFF" position. Verify that actuator goes to "OFF" position.
  (c) Connect positive terminal to Pin No. 3 to select actuator to "RUN" position. Check that rig pin can be inserted when actuator is in "RUN" position. Disconnect positive terminal from Pin No. 3 and remove rig pin.
  (d) If rig pin cannot be inserted at "RUN" position when selected, recheck installation for proper assembly and repeat previous steps.

POWER PLANT GENERAL − MAIN GEARBOX − INSTALLATION−17

Task 71−00−61−450−017−002:

2. Install HP Fuel Shutoff Valve Actuator (PN 221D4003−509)

A. Equipment And Materials Required

Special Tools:
RSE1041−1 Rig Pin

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Lockwire, MS20995C32				

CAUTION: THESE RIGGING INSTRUCTIONS ARE TO BE USED ONLY WITH ACTUATORS, PN 221D4003−509.

B. Procedure
See Figure 403.

NOTE: The HP fuel shutoff actuator is installed and rigged in the "OFF" position.

(1) Rotate Fuel Metering Unit (FMU) condition shaft clockwise from "RUN" to "OFF" position.
(2) Install RSE1041−1 rig pin through hole on FMU into rigging slot of condition shaft cam.
(3) Remove protective covers and connect electrical connector DH10 to actuator. Tighten connector fingertight only at this time.

CAUTION: DO NOT ATTEMPT TO MANUALLY ROTATE THE HP FUEL SHUTOFF VALVE ACTUATOR MOTOR TO THE "OFF" POSITION.

(4) Energize HP fuel shutoff valve actuator motor to run from "RUN" position to "OFF" position. See Figure 402.

NOTE: Use an external power source of 28 volts DC and connect the terminals to the following pins:

Pin No. 5 Negative terminal

Connect positive terminal, in sequence, to the following pins:

Pin No. 3 Selects to "RUN" position
Pin No. 1 Selects to "OFF" position

POWER PLANT GENERAL − MAIN GEARBOX − INSTALLATION−17

(5) Verify actuator position indicator is in "OFF" position. See Figure 404.

CAUTION: VERIFY THAT SHIM (POST SB PW4NAC73−2), WHICH PREVENTS INTERFERENCE BETWEEN FUEL METERING UNIT SHAFT AND FUEL SHUTOFF VALVE ACTUATOR SHAFT, IS RIVETED TO ADAPTER ASSEMBLY.

(6) Install adapter on FMU with three bolts and washers. Torque bolts 20 − 25 lb−in. (2.260 − 2.825 N.m).
(7) Install HP fuel shutoff valve actuator on FMU adapter.
    (a) Align splines of shutoff valve condition shaft with socket splines of actuator and position actuator on adapter.
    (b) Check attaching bolt hole alignment between actuator and adapter. If the three bolt holes are not aligned, loosen self−locking nut on actuator position indicator and remove lockwire from indicator adjustment screw. Turn adjustment screw until holes align. Lockwire adjustment screw. Tighten and torque self−locking nut on actuator position indicator to 57 − 63 lb−in. (6.440 − 7.118 N.m).
    (c) Install three bolts and washers. Torque bolts 50 − 70 lb−in. (5.6 − 6.9 N.m) and lockwire.
(8) Remove rig pin from FMU.
(9) Energize HP fuel shutoff valve actuator motor to rotate from "OFF" position to "RUN" position and back to "OFF" position.
    (a) Check that rig pin can be inserted at "OFF" position. Verify that actuator rotates to "RUN" position.
    (b) If rig pin cannot be inserted in "OFF" position when selected, recheck installation for proper assembly and repeat steps 2.B.(1) through 2.B.(9).
(10) Use an external power source of 28 volts DC and perform the following steps.
    (a) Connect negative terminal to Pin 5 of actuator receptacle.
    (b) Connect positive terminal to Pin No. 3 to select actuator to "RUN" position. Verify that actuator goes to "RUN" position.
    (c) Connect positive terminal to Pin No. 1 to select actuator to "OFF" position. Check that rig pin can be inserted when actuator is in "OFF" position.
    (d) Disconnect positive terminal from Pin No. 1 and remove rig pin.

POWER PLANT GENERAL − MAIN GEARBOX − INSTALLATION−18

Task 71−00−61−450−018:

1. Install Drain Collector Manifold Assembly
   A. Equipment And Materials Required − None
   B. Procedure
      See Figure 401.
      (1) Position engine accessory drain manifold on the engine case and attach using four bolts and washers. Tighten bolts fingertight.
      (2) Check the drain manifold alignment with the drain tubes to be connected and torque bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).
      (3) Remove protective covers from the drain manifold tee ports and the lines that connect to the tee. Connect the two drain lines and torque drain line nuts to 300 lb−in. (33.895 N.m).
      (4) Remove protective covers from drain manifold ports and the lines that connect to the right−hand manifold side. Connect the drain lines and torque drain line nut to 300 lb−in. (33.895 N.m).

POWER PLANT GENERAL - MAIN GEARBOX - INSTALLATION-19

Task 71-00-61-450-019:

1. Install Accessory Drain Tubing
   A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Packing	9	71-70-01	1	230
Packing	4	71-70-02	1	178
Packing	1	71-70-02	1	180
Packing	1	71-70-02	1	185

B. Procedure

CAUTION: INSTALL DRAIN TUBES, FITTINGS, AND CLAMPS FINGERTIGHT UNTIL DRAIN TUBE ALIGNMENT HAS BEEN VERIFIED OR DAMAGE TO EQUIPMENT CAN OCCUR.

(1) Install engine drain collector manifold assembly. See 71-00-61, Installation-18.
(2) Remove all protective covers.
(3) Install hydraulic pumps drain tube (401/2). See Figure 401.
   (a) Lubricate packings (401/5) with Engine Oil (P03-001) and position on unions (401/11).
   (b) Install two unions (401/11) in reducers (401/1 and 401/10) and torque to 250 - 300 lb-in. (28.246 - 33.895 N.m).
   (c) Install hydraulic drain tube (401/2) finger-tight on unions (401/11) and tee fitting (401/4).
   (d) Install clamp (401/3) with attaching parts fingertight on hydraulic pumps drain tube (401/2).
   (e) Ensure alignment of drain tube (401/2) and torque connectors at two unions (401/11) to 300 lb-in. (33.895 N.m).
   (f) Torque connector on top end of hydraulic pumps discharge tube (401/2) at tee fitting (401/4) to 300 lb-in. (33.895 N.m).
   (g) Torque clamp (401/3) to 20 - 25 lb-in. (2.260 -

(4) Install left side engine drain tubing. See Figure 402.
  - (a) Install union (402/29) on bracket (402/30).

  - (b) Install union (402/11) on lower end of drain tube (402/34).
  - (c) Install drain tube (402/34) to tee (402/29).
  - (d) Install drain tube (402/33) to union (402/11) on lower end of drain tube (402/34) and to engine drain manifold discharge tube (402/37).
  - (e) Install clamp (402/19) with attaching parts to drain tube (402/33).
  - (f) Ensure that all sections of pylon drain system are correctly aligned.
  - (g) On bracket (402/30) torque nut (402/18) on tee (402/29) to 300 lb−in. (33.895 N.m).
  - (h) Torque connectors on drain tube (402/33) to 300 lb−in. (33.895 N.m).
  - (i) On drain tube (402/33), torque nut on clamp (402/19) to 20 − 25 lb−in. (2.260 − 2.825 N.m).
  - (j) Torque connectors on drain tube (402/34) to 300 lb−in. (33.895 N.m).
  - (k) On drain tube (402/34), torque nut on clamp (402/19) to 20 − 25 lb−in. (2.260 − 2.825 N.m).

(5) Install oil tank scupper drain tube. See Figure 402.
  - (a) Lubricate packing (402/5) with Engine Oil (P03−001) and position on union (402/11).
  - (b) Install union (402/11) on oil scupper drain port and torque to 250 − 300 lb−in. (28.246 − 33.895 N.m).
  - (c) Install oil scupper drain tube (402/35) fingertight on union (402/11) and union (402/29).
  - (d) Ensure alignment and torque drain tube (402/35) connectors to 300 lb−in. (33.895 N.m).

(6) Install fuel pump drain line. See Figure 403.
  - (a) Lubricate packing (403/5) with Engine Oil (P03−001) and position on union (403/11).
  - (b) Install union (403/11) on fuel pump drain tube (403/20), Port SD2, Flange J, and torque to 250 − 300 lb−in. (28.246 − 33.895 N.m).
  - (c) Install fuel pump drain tube (403/28) finger−tight on union (403/11) and engine drain manifold at fuel pump input connector.
  - (d) Ensure alignment and torque drain tube (403/28) connectors to 300 lb−in. (33.895 N.m).

(7) Install EEC drain tubing. See Figure 403.
  (a) Lubricate packing (403/5) with Engine Oil (P03−001) and position on union (403/11).
  (b) Install union (403/11) in PMA drain port (403/22), Port SD8, and torque to 250 − 300 lb−in. (28.246 − 33.895 N.m).
  (c) Install EEC drain tube (403/27) fingertight on union (403/11).
  (d) Install clamp (403/25) with attaching parts fingertight on drain tube (403/27).
  (e) Install EEC drain tube (403/26) fingertight on lower end off EEC drain tube (403/27) and engine drain manifold at EEC input connector.
  (f) Ensure alignment of drain tubes (403/27 and 403/26) and torque connectors to 300 lb−in. (33.895 N.m).
  (g) On drain tube (403/27) torque nut on clamp (403/25) to 20 − 25 lb−in. (2.260 − 2.825 N.m).

(8) Install starter drain tube. See Figure 403.
  (a) Lubricate packing (403/5) with Engine Oil (P03−001) and position on union (403/11).
  (b) Install union (403/11) in reducer (403/33), at pneumatic engine starter drain Port SD5, Flange K, and torque to 250 − 300 lb−in. (28.246 − 33.895 N.m).
  (c) Install starter drain tube (403/19) fingertight on union (403/11) and engine drain manifold at starter input connector.
  (d) Ensure alignment of drain tube (403/19) and torque connectors to 300 lb−in. (33.895 N.m).

(9) Install integrated drive generator (IDG) drain tube (402/32). See Figure 402.
  (a) Lubricate packing (402/5) with Engine Oil (P03−001) and position on union (402/11).
  (b) Install union (402/11) in reducer (402/36) at IDG Port SD6 and torque to 250 − 300 lb−in. (28.246 − 33.895 N.m).
  (c) Connect IDG drain tube (402/32) fingertight to union (402/11) and engine drain manifold at IDG input connector.
  (d) Ensure alignment of drain tube (402/32) and torque tube connectors to 300 lb−in. (33.895 N.m).

(10) Install bleed actuator drain tubing. See Figure 404.

Engine Drain System
Figure 404
(Task 71−00−61−450−019)

(a) Lubricate packing (404/5) with Engine Oil (P03−001) and position on union (404/11).
(b) Install union (404/11) in bleed actuator drain port and torque to 250 − 300 lb−in. (28.246 − 33.895 N.m).
(c) Install tee (404/30) fingertight on aft end of bleed actuator drain tube (404/33).
(d) Connect drain tube (404/33) to union (404/11) on bleed actuator drain port.
(e) Install clamp (404/19) with attaching parts on drain tube (404/33).
(f) Connect drain tube (404/27) to tee (404/30) and drain manifold direct discharge tube.
(g) Connect clamp (404/19) with attaching parts to drain tube (404/27).
(h) Connect drain tube (402/15), fingertight to tee (404/30).
(i) Install clamp (404/31) with attaching parts fingertight on drain tube (402/15).

NOTE: Drain tube (402/15) is installed fingertight at this step to allow tee (404/30) to be aligned and torqued.

(j) Torque forward end of drain tube (404/33) on union (404/11) and aft end on tee (404/30) to 300 lb−in. (33.895 N.m).
(k) Torque clamp (404/19) on drain tube (404/33) to 20 − 25 lb−in. (2.260 − 2.825 N.m).
(l) Torque connectors on drain tube (404/27) to 300 lb−in. (33.895 N.m).
(m) Torque clamp (404/19) on drain tube (404/27) to 20 − 25 lb−in. (2.260 − 2.825 N.m).

(11) Install fuel/oil cooler, rear fuel drain tubing, Port AP25. See Figure 404.
(a) Install jamnut (404/18) fingertight on elbow (404/2).
(b) Lubricate packing (404/5) with Engine Oil (P03−001) and position on elbow (404/5).
(c) Install elbow (404/2) fingertight in Port AP25.
(d) Install union (404/11) on lower end of drain tube (404/24).
(e) Install upper end of drain tube (404/24) to elbow (404/2).
(f) On drain tube (404/24) install clamp (404/19) with attaching parts fingertight to bracket (404/6).
(g) Install drain tube (404/32) to union (404/11) on lower end of drain tube (404/24) and to tee

fitting (404/42) on drain tube (404/33).

(h) Install clamp (404/41) with attaching parts on drain tube (404/32).

(i) Ensure alignment of drain tubes (404/24 and 404/32) and torque jamnut (404/18) on elbow (404/2) to 300 lb−in. (33.895 N.m).

(j) Torque connectors on drain tubes (404/24 and 404/32) to 300 lb−in. (33.895 N.m).

(k) Torque clamp (404/19) on drain tube (404/24) to 20 − 25 lb−in. (2.260 − 2.825 N.m).

(l) Torque clamp (404/41) on drain tube (404/32) to 20 − 25 lb−in. (2.260 − 2.825 N.m).

(12) Install air/oil cooler, engine drain tube (404/34). See Figure 404.

(a) Lubricate packing (404/5) with Engine Oil (P03−001) and position on union (404/11). Install union (404/11) in air/oil cooler, engine drain port and torque to 250 − 300 lb−in. (28.246 − 33.895 N.m).

(c) Install drain tube (404/34) fingertight on union (404/11) and tee fitting (404/38).

(d) Ensure alignment of drain tube (404/34) and torque connectors to 300 lb−in. (33.895 N.m).

(13) Install fuel/oil cooler IDG core fuel drain tube Port AP21. See Figure 404.

(a) Install jamnut (404/18) fingertight on 45 degrees elbow (404/17).

(b) Lubricate packing (404/5) with Engine Oil (P03−001) and position on 45 degrees elbow (404/17).

(c) Install 45 degrees elbow (404/17) fingertight in drain Port AP21.

(d) Install drain tube (404/35) fingertight on 45 degrees elbow (404/17) and tee fitting (404/37).

(e) Ensure alignment of drain tube (404/35) and elbow (404/17) and torque jamnut (404/18) to 300 lb−in. (33.895 N.m) and drain tube (404/35) connectors to 300 lb−in. (33.895 N.m).

(14) Install fuel/oil cooler bypass valve oil drain tube (404/39), Port AP30. See Figure 404.

(a) Lubricate packing (404/5) with Engine Oil (P03−001) and position on union (404/11).

(b) Install union (404/11) in Port AP30 and torque to 250 − 300 lb−in. (28.246 − 33.895 N.m).

(c) Install drain tube (404/39) fingertight on union (404/11) and tee fitting (404/40).

(d) Ensure alignment of drain tube (404/39) and torque connectors to 300 lb−in. (33.895 N.m).

(15) Install fuel/oil cooler, front fuel drain tubing (404/4), drain Port AP24. See Figure 404.
  (a) Lubricate packing (404/5) with Engine Oil (P03−001) and position on union (404/11).
  (b) Install union (404/11) in drain Port AP24 and torque to 250 − 300 lb−in. (28.246 − 33.895 N.m).
  (c) Install drain tube (404/4) fingertight on union (404/11) and tee fitting (404/25).
  (d) Ensure alignment of drain tube (404/4) and torque connectors to 300 lb−in. (33.895 N.m).

(16) Install turbine case cooling (TCC) actuator drain tubing. See Figure 403.
  (a) Lubricate packing (404/3) with Engine Oil (P03−001) and position on union (403/2).
  (b) Install union (403/2) in TCC cooling actuator drain and torque to 150 lb−in. (16.948 N.m).
  (c) Install 45 degrees elbow (403/17) fingertight on bracket (403/16).
  (d) Install TCC actuator drain hose (403/1) fingertight on union (403/2) and elbow (403/17).
  (e) Ensure alignment of elbow (403/17) and torque to 300 lb−in. (33.895 N.m).
  (f) Ensure alignment of drain hose (403/1) and torque connectors to 300 lb−in. (33.895 N.m).
  (g) Install drain tube (403/4) fingertight on elbow (403/17) and cross fitting (403/14).
  (h) Install clamp (403/7) fingertight on drain tube (403/4) at bracket (403/6).
  (i) Ensure alignment of drain tube (403/4) on elbow (403/17) and cross fitting (403/14), and ensure alignment of drain tube (403/15) on tee (403/24) and cross fitting (403/14).
  (j) Torque drain tube (403/4 and 403/15) connectors to 300 lb−in. (33.895 N.m).
  (k) Torque clamp (403/7) on drain tube (403/15) to 20 − 25 lb−in. (2.260 − 2.825 N.m).
  (l) Torque clamp (403/7) on drain tube (403/4) to 20 − 25 lb−in. (2.260 − 2.825 N.m).

(17) Install engine vane bellcrank drain tubing (403/12). See Figure 403.
  (a) Lubricate packing (403/5) with Engine Oil (P03−001) and position on union (403/11).
  (b) Install union (403/11) in engine bellcrank actuator port and torque to 250 − 300 lb−in. (28.246 − 33.895 N.m).
  (c) Install drain tube (403/12) fingertight to union (403/11) and cross fitting (403/14).

    - (d) Install clamp (403/7) with attaching parts fingertight that clamps electrical cable (403/32) to drain tube (403/12).
    - (e) Install clamp (403/7) with attaching parts fingertight that clamps drain tube (403/12) to mounting bracket.
    - (f) Ensure that drain tube (403/12) and clamps (403/7) are aligned.
    - (g) Torque drain tube (403/12) connectors to 300 lb−in. (33.895 N.m).
    - (h) Torque two clamps (403/7) to 20 − 25 lb−in. (2.260 − 2.825 N.m).
- (18) Install air/oil cooler, IDG actuator drain tube (403/13). See Figure 403.
    - (a) Lubricate packing (403/5) with Engine Oil (P03−001) and position on union (403/11).
    - (b) Install union (403/11) in IDG actuator drain port and torque to 250 − 300 lb−in. (28.246 − 33.895 N.m).
    - (c) Install drain tube (403/13) fingertight to union (403/11) and cross fitting (403/14).
    - (d) Ensure alignment of drain tube (403/13) and torque to 300 lb−in. (33.895 N.m).
- (19) Install drip pan tube assembly. See Figure 405.
    - (a) Install drip pan assembly tube assembly (405/1) with attaching parts fingertight to bracket (403/2).
    - (b) Install the two middle clamps (405/8) with attaching parts fingertight to drip pan tube assembly (405/1).
    - (c) Install the lower clamps (405/8) with attaching parts to drip pan tube assembly (405/1).
    - (d) Ensure that drip pan assembly (405/1) is correctly positioned and torque nut (405/5) on bracket (405/2) to 50 − 70 lb−in. (5.649 − 7.909 N.m).
    - (e) Torque nuts (405/11) on clamps (405/8) to 20 − 25 lb−in. (2.260 − 2.825 N.m).

POWER PLANT GENERAL - MAIN GEARBOX - INSTALLATION-25

Task 71-00-61-450-031:

1. Install Fuel Pump Interstage Pressure Transmitter

A. Equipment And Materials Required

Standard Tools:
Torque Wrench, 0 - 200 lb-in. (0.000 - 22.597 N.m) Range

B. Procedure

See Figure 401.

(1) Position fuel pump interstage pressure transmitter (401/1) on transmitter support bracket and install two screws (401/7), washers (401/8), and nuts (401/9) in transmitter aft mounting flange holes.

(2) Position wire harness support bracket (401/6) on transmitter support bracket and install two screws (401/4) and washers (401/5) through transmitter forward mounting flange holes and into nutplates on wire harness support bracket.

(3) Torque screws (401/4) to 63 - 70 lb-in. (7.118 - 7.909 N.m).

(4) Torque transmitter aft mounting flange nuts (401/9) to 50 - 70 lb-in. (5.649 - 7.909 N.m).

(5) Remove protective covers and connect fuel tube assembly (401/2) coupling nut to transmitter union (401/3).

(6) Torque coupling nut to 135 - 150 lb-in. (15.253 - 16.948 N.m).

(7) Remove protective covers and connect electrical connector DT581 to transmitter. Tighten connector fingertight plus one-eighth turn.

Task 71-00-61-450-032:

1. Install Oil Temperature Sensor

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIG.	ITEM
Packing	1	79-33-01	1	90

B. Procedure

See Figure 401.

(1) Remove protective covers from electrical connector DT582 and sensor port.

(2) Lubricate new packing with Oil (P03-001) and position packing on oil temperature sensor.

(3) On bottom of main gearbox, install oil temperature sensor with new packing. Torque oil temperature sensor 150 - 170 lb-in. (16.948 - 19.207 N.m).

(4) Install electrical connector DT582 to oil temperature sensor. Tighten electrical connector fingertight plus one-eighth turn.

Task 71-00-61-450-033:

1. Install No. 3 Bearing Oil Temperature Sensor (Immersion Thermocouple)

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIG.	ITEM
Packing	1	79-33-01	1	70

B. Procedure

See Figure 401.

(1) Remove protective covers from electrical connector and LT2 port.

(2) Lubricate new packing with Oil (P03-001) and position packing on sensor.

(3) At LT2 port on No. 3 bearing scavenge line, install oil temperature sensor with new packing. Torque temperature sensor 90 - 100 lb-in. (10.2 - 11.3 N.m).

(4) Connect electrical connector DT597 to sensor. Tighten connector fingertight plus one-eighth turn.

Task 71−00−61−450−034:

1. Install IDG, Starter, And Hydraulic Pump Heat Shields

A. Equipment And Materials Required − None

B. Procedure

See Figure 401.

(1) Attach IDG heat shield (401/1) to support brackets using two sets of screws (401/3, 401/4) and four washers (401/2). Torque screws to 50 − 70 lb−in. (5.65 − 7.91 N.m).

(2) Attach starter heat shield (401/5) to support brackets using screws (401/3, 401/7, 401/8) and washers (401/2, 401/6). Torque screws to 50 − 70 lb−in. (5.65 − 7.91 N.m).

(3) Attach hydraulic pump heat shield (401/10) to support brackets using screws (401/3, 401/12) and washers (401/2, 401/11). Torque screws to 50 − 70 lb−in. (5.65 − 7.91 N.m).

POWER PLANT GENERAL - MAIN GEARBOX - INSTALLATION-29

Task 71-00-61-450-035:

1. Install Starter Control Valve Cooling Tube And Hose

   A. Equipment And Materials Required - None

   B. Procedure

   See Figure 401.

   (1) Connect clamp (401/1) securing lower end of cooling hose (401/2) to starter control valve. Torque clamp to 25 - 30 lb-in. (2.83 - 3.39 N.m).

   (2) Connect cooling hose (401/2) to starter control valve cooling tube (401/3) with clamp (401/4). Torque clamp to 25 - 30 lb-in. (2.83 - 3.39 N.m).

   (3) Attach upper end of starter control valve cooling tube (401/3) to ignition cooling duct. Torque coupling nut 400 - 500 lb-in. (50.9 - 56.5 N.m).

   (4) Attach cooling hose (401/2) and starter control valve cooling tube (401/3) to bracket on Flange M using clamp (401/5), washer (401/6), screw (401/7), and nut (401/8). Torque nut 20 - 25 lb-in. (2.3 - 2.8 N.m).

Starter Control Valve Cooling Tube And Hose
Figure 401
(Task 71−00−61−450−035)

POWER PLANT GENERAL − MAIN GEARBOX − INSTALLATION−30

Task 71−00−61−450−036:

1. Install EEC Alternator (PMA) Cooling Hose And Tubes

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P06−002	Petrolatum, White

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIG.	ITEM
Lockwire, MS20995C32				

B. Procedure

See Figure 401.

(1) Lubricate packings (401/1) with Petrolatum (P06−002).

(2) Install connector coupling body on ignition cooling duct (401/2) and coupling nut on TCC duct.

(3) Install washer and packing in coupling nut, install washer and packing on coupling body using lubricated packings to retain washers.

(4) Secure TCC duct and ignition cooling duct (401/2) together with snap retainer.

(5) Engage connector body and coupling nut threads, then torque to 8.1 − 9.9 lb−ft. (11.0 − 13.4 N.m) and lockwire.

NOTE: Connector consists of coupling body, coupling nut, two washers, and snap retainer.

(6) Attach ignition cooling duct (401/2) to bracket with clamp (401/3), screw (401/4), washer (401/5), and nut (401/6). Torque nut to 20 − 25 lb−in. (2.3 − 2.8 N.m).

(7) Connect ignition cooling duct (2) to tube (401/7) and tighten nut fingertight.

(8) Position clamp (401/8) near end of tube (401/7) and attach clamp to bracket with screw (401/4), washer (401/9), and nut (401/6). Torque nut to 20 − 25 lb−in. (2.5 − 2.8 N.m).

(9) Position clamp (401/3) on duct (401/2) near bracket on starter pad, and attach clamp to bracket with screw (401/4) and washer (401/9). Torque screw 22 − 25 lb−in. (2.5 − 2.8 N.m).

(10) Torque tube coupling nut joining duct (401/2) and tube (401/7) to 480 − 720 lb−in. (54.2 − 81.3 N.m).

(11) Connect hose (401/10) to tube (401/7) with clamp (401/11) to 25 − 30 lb−in. (2.8 − 3.4 N.m).

(12) Connect hose (401/10) to PMA cooling shroud with clamp (401/11). Torque clamp to 25 − 30 lb−in. (2.8 − 3.4 N.m).

POWER PLANT GENERAL − MAIN GEARBOX − INSTALLATION−31

Task 71−00−61−450−037:

1. Install Starter Cooling Tubes

A. Equipment And Materials Required − None

B. Procedure

See Figure 401.

(1) Install coupling nut on upper end of starter cooling tube (401/1) to ignition cooling duct. Tighten coupling fingertight.

(2) Install starter halo cooling tube (401/2) to mounting brackets using clamps (401/3), screws (401/4), washers (401/5), and nuts (401/6). Torque nuts to 20 − 25 lb−in. (2.32 − 2.82 N.m).

(3) Connect starter cooling tube (401/1) coupling to nipple on starter halo cooling tube. Torque coupling 450 − 500 lb−in. (50.9 − 56.5 N.m).

(4) Torque starter cooling tube (401/1) coupling nut at ignition cooling duct to 450 − 500 lb−in. (50.9 − 56.5 N.m).

POWER PLANT GENERAL - MAIN GEARBOX - INSTALLATION-32

Task 71-00-61-450-038:

1. Install Oil Quantity Transmitter Cooling Tube

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P06-002	Petrolatum, White

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Lockwire, MS20995C32				

B. Procedure

See Figure 401.

(1) Lubricate packings (401/1) with White Petrolatum (P06-002).

(2) Install connector coupling body on oil quantity transmitter tube (401/2) and coupling nut on LH TRC valve.

(3) Install washer and packing in coupling nut, install washer and packing on coupling body using lubricated packings to retain washers.

(4) Secure oil quantity transmitter tube and LH TRC valve together with snap retainer.

(5) Engage connector body and coupling nut threads, then tighten fingertight.

NOTE: Connector consists of coupling body, coupling nut, two washers, and snap retainer.

(6) Attach oil quantity transmitter tube (401/2) to two brackets using clamps (401/3), screws (401/4), washers (401/5), and nuts (401/6). Torque nut to 20 - 25 lb-in. (2.26 - 2.82 N.m).

POWER PLANT GENERAL − MAIN GEARBOX − INSTALLATION−32

(7) Connect hose (401/7) to forward end of oil quantity transmitter tube (401/2) and to cooling air supply tube using two clamps (401/8, 401/9).

(8) Torque connector body (in step (5)) to 5.4 − 6.6 lb−ft. (7.3 − 8.9 N.m) and lockwire.

(9) Loosely connect tube (401/10) coupling nut to nipple on oil quantity transmitter tube.

(10) Attach tube (401/10) to brackets using clamps (401/11), screws (401/4), washers (401/5), and nuts (401/6). Torque nuts to 20 − 25 lb−in. (2.26 − 2.82 N.m).

(11) Torque tube (401/10) coupling nut to 450 − 500 lb−in. (50.84 − 56.49 N.m).

(12) Connect hose (401/13) to tube (401/10) and to oil quantity transmitter cooling shroud using two clamps (401/12). Torque clamps to 25 − 30 lb−in. (2.82 − 3.39 N.m).

PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

Tab Separator - Power Plant General - Fan Case

List of Effective Pages - Power Plant General - Fan Case

PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

CHAPTER 71

POWER PLANT GENERAL - MAIN GEARBOX

TABLE OF CONTENTS

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
POWER PLANT GENERAL - MAIN GEARBOX	71-00-61		
Removal-01		301	ALL
Task 71-00-61-050-001: Remove Hydraulic Hoses (Abex Pump)		301	
Removal-02		301	ALL
Task 71-00-61-050-002: Remove Hydraulic Hoses (Sperry-Vickers Pump)		301	
Removal-03		301	ALL
Task 71-00-61-050-003: Remove Starter Shutoff Valve		301	
Removal-04		301	ALL
Task 71-00-61-050-004: Remove Integrated Drive Generator (IDG)		301	
Removal-05		301	ALL
Task 71-00-61-050-005: Remove IDG Quick-Attach-Detach (QAD) Adapter		301	
Removal-06		301	ALL
Task 71-00-61-050-006: Remove Main Fuel Supply Line		301	
Removal-07		301	ALL
Task 71-00-61-050-007: Remove Low Oil Pressure Switch And Oil Pressure Transmitter		301	
Removal-08		301	ALL
Task 71-00-61-050-008: Remove Oil Filter Differential Pressure Switch		301	
Removal-09		301	ALL
Task 71-00-61-050-009: Remove Engine Core Compartment Temperature Sensor		301	
Removal-10		301	ALL
Task 71-00-61-050-010: Remove Engine Oil Tank Pressure Fill System		301	
Removal-11		301	ALL
Task 71-00-61-050-011: Remove Oil Quantity Transmitter		301	
Removal-12		301	ALL
Task 71-00-61-050-012:			

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
POWER PLANT GENERAL - MAIN GEARBOX (CONTINUED)	71-00-61		
Remove Front Hydraulic Pump		301	
Removal-13		301	ALL
Task 71-00-61-050-013: Remove Rear Hydraulic Pump		301	
Removal-14		301	ALL
Task 71-00-61-050-014: Remove Starter Assembly		301	
Removal-15		301	ALL
Task 71-00-61-050-015: Remove Chip Detectors		301	
Removal-16		301	ALL
Task 71-00-61-050-016: Remove Deoiler Vent Duct		301	
Removal-17		301	ALL
Task 71-00-61-050-017-001: Remove HP Fuel Shutoff Valve Actuator (PN 221D4003-507)		301	
Task 71-00-61-050-017-002: Remove HP Fuel Shutoff Valve Actuator (PN 221D4003-509)		301	
Removal-18		301	ALL
Task 71-00-61-050-018: Remove Drain Collector Manifold Assembly		301	
Removal-19		301	ALL
Task 71-00-61-050-019: Remove Accessory Drain Tubing		301	
Removal-25		301	ALL
Task 71-00-61-050-031: Remove Fuel Pump Interstage Pressure Transmitter		301	
Removal-26		301	ALL
Task 71-00-61-050-032: Remove Oil Temperature Sensor		301	
Removal-27		301	ALL
Task 71-00-61-050-033: Remove No. 3 Bearing Oil Temperature Sensor (Immersion Thermocouple)		301	
Removal-28		301	ALL
Task 71-00-61-050-034: Remove IDG Starter, And Hydraulic Pump Heat Shields		301	
Removal-29		301	ALL
Task 71-00-61-050-035: Remove Starter Control Valve Cooling Tube And Hose		301	

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
POWER PLANT GENERAL - MAIN GEARBOX (CONTINUED)	71-00-61		
Removal-30		301	ALL
Task 71-00-61-050-036: Remove EEC Alternator (PMA) Cooling Hose And Tubes		301	
Removal-31		301	ALL
Task 71-00-61-050-037: Remove Starter Cooling Tubes		301	
Removal-32		301	ALL
Task 71-00-61-050-038: Remove Oil Quantity Transmitter Cooling Tube		301	
Installation-01		401	ALL
Task 71-00-61-450-001: Install Hydraulic Hoses (Abex Pump)		401	
Installation-02		401	ALL
Task 71-00-61-450-002: R Install Hydraulic Hoses R (Sperry-Vickers Pump)		401	
Installation-03		401	ALL
Task 71-00-61-450-003: Install Starter Shutoff Valve		401	
Installation-04		401	ALL
Task 71-00-61-450-004: Install Integrated Drive Generator (IDG)		401	
Installation-05		401	ALL
Task 71-00-61-450-005: Install IDG Quick-Attach-Detach (QAD) Adapter		401	
Installation-06		401	ALL
Task 71-00-61-450-006: Install Main Fuel Supply Line		401	
Installation-07		401	ALL
Task 71-00-61-450-007: Install Low Oil Pressure Switch And Oil Pressure Transmitter		401	
Installation-08		401	ALL
Task 71-00-61-450-008: Install Oil Filter Differential Pressure Switch		401	
Installation-09		401	ALL
Task 71-00-61-450-009: Install Engine Core Compartment Temperature Sensor		401	
Installation-10		401	ALL
Task 71-00-61-450-010:			

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
POWER PLANT GENERAL - MAIN GEARBOX (CONTINUED)	71-00-61		
Install Engine Oil Tank Pressure Fill System		401	
Installation-11		401	ALL
Task 71-00-61-450-011: Install Oil Quantity Transmitter		401	
Installation-12		401	ALL
Task 71-00-61-450-012: Install Front Hydraulic Pump		401	
Installation-13		401	ALL
Task 71-00-61-450-013: Install Rear Hydraulic Pump		401	
Installation-14		401	ALL
Task 71-00-61-450-014: Install Starter Assembly		401	
Installation-15		401	ALL
Task 71-00-61-450-015: Install Chip Detectors		401	
Installation-16		401	ALL
Task 71-00-61-450-016: Install Deoiler Vent Duct		401	
Installation-17		401	ALL
Task 71-00-61-450-017-001: Install HP Fuel Shutoff Valve Actuator (PN 221D4003-507)		401	
Task 71-00-61-450-017-002: Install HP Fuel Shutoff Valve Actuator (PN 221D4003-509)		405	
Installation-18		401	ALL
Task 71-00-61-450-018: Install Drain Collector Manifold Assembly		401	
Installation-19		401	ALL
Task 71-00-61-450-019: Install Accessory Drain Tubing		401	
Installation-25		401	ALL
Task 71-00-61-450-031: Install Fuel Pump Interstage Pressure Transmitter		401	
Installation-26		401	ALL
Task 71-00-61-450-032: Install Oil Temperature Sensor		401	
Installation-27		401	ALL
Task 71-00-61-450-033: Install No. 3 Bearing Oil Temperature Sensor (Immersion Thermocouple)		401	
Installation-28		401	ALL

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
POWER PLANT GENERAL - MAIN GEARBOX (CONTINUED)	71-00-61		
Task 71-00-61-450-034: Install IDG, Starter, And Hydraulic Pump Heat Shields		401	
Installation-29		401	ALL
Task 71-00-61-450-035: Install Starter Control Valve Cooling Tube And Hose		401	
Installation-30		401	ALL
Task 71-00-61-450-036: Install EEC Alternator (PMA) Cooling Hose And Tubes		401	
Installation-31		401	ALL
Task 71-00-61-450-037: Install Starter Cooling Tubes		401	
Installation-32		401	ALL
Task 71-00-61-450-038: Install Oil Quantity Transmitter Cooling Tube		401

	HIGHLIGHTS
	TABLE OF CONTENTS
72−00−00	ENGINE GENERAL − DESCRIPTION/OPERATION−00 • 72−00−00−990−005: General.
72−00−00	ENGINE GENERAL − SPECIAL PROCEDURES−01 • 72−00−00−010−001: Transfer Engine From Transport Stand To Pedestals
72−00−00	ENGINE GENERAL − SPECIAL PROCEDURES−02 • 72−00−00−410−001: Transfer Engine From Pedestals To Transport Stand
72−00−00	ENGINE GENERAL − SPECIAL PROCEDURES−03 • 72−00−00−830−001: Rig 2.5 Bleed Valve Actuator (Manual)
72−00−00	ENGINE GENERAL − SPECIAL PROCEDURES−04 • 72−00−00−830−002−A: Rig Variable Stator Vane Actuator − (Hydraulic Procedure) • 72−00−00−830−002−B: Rig Variable Stator Vane Actuator − (Mechanical Procedure)
72−00−00	ENGINE GENERAL − SPECIAL PROCEDURES−05 • 72−00−00−830−003−A: Rig Variable Stator Vane Control System − (Hydraulic Procedure) • 72−00−00−830−003−B: Rig Variable Stator Vane Control System − (Mechanical Procedure)
72−00−00	ENGINE GENERAL − SPECIAL PROCEDURES−06 • 72−00−00−830−004: Rig The Turbine Case Cooling (TCC) Control System−Check And Partial Rig With Undersize Rigging Pins
72−00−00	ENGINE GENERAL − SPECIAL PROCEDURES−07 • 72−00−00−020−001: Trunnion Intermediate Case Through HPT From Horizontal To Front End Down Position
72−00−00	ENGINE GENERAL − SPECIAL PROCEDURES−08 • 72−00−00−420−001: Trunnion Intermediate Case Through HPT From Front End Down To Horizontal Position

72−00−00	ENGINE GENERAL − SPECIAL PROCEDURES−09 • 72−00−00−020−002−A: Trunnion Intermediate Case Through Diffuser And Combustor From Horizontal To Front End Down Position • 72−00−00−020−002−B: Trunnion Intermediate Case Through Diffuser And Combustor From Horizontal To Front End Down Position − Optional Method
72−00−00	ENGINE GENERAL − SPECIAL PROCEDURES−10 • 72−00−00−420−002−A: Trunnion Intermediate Case Through Diffuser And Combustor From Front End Down To Horizontal Position • 72−00−00−420−002−B: Trunnion Intermediate Case Through Diffuser And Combustor From Front End Down To Horizontal Position − Optional Method
72−00−00	ENGINE GENERAL − SPECIAL PROCEDURES−11 • 72−00−00−830−005: Rig The Turbine Case Cooling (TCC) Control System−Complete Rig With Standard Rigging Pins
72−00−00	ENGINE GENERAL − SPECIAL PROCEDURES−12 • 72−00−00−020−003: Trunnion Fan Cases Through HPT (Without LPC) From Horizontal To Front End Down Position
72−00−00	ENGINE GENERAL − SPECIAL PROCEDURES−13 • 72−00−00−420−003: Trunnion Fan Cases Through HPT From Front End Down To Horizontal Position
72−00−00	ENGINE GENERAL − SPECIAL PROCEDURES−16 • 72−00−00−840−004: Change The Engine Thrust Level (Only)
72−00−00	ENGINE GENERAL − SPECIAL PROCEDURES−17 • 72−00−00−840−007: Convert An Airbus Model Engine (As Manufactured By Pratt & Whitney) To A Boeing Model Engine
72−00−00	ENGINE GENERAL − SPECIAL PROCEDURES−18 • 72−00−00−840−010: Complete The Conversion Of A Boeing Model Engine (As Manufactured By Pratt & Whitney) To An Airbus Model Engine
72−00−00	ENGINE GENERAL − SPECIAL PROCEDURES−19 • 72−00−00−840−013: Convert An Airbus Model Engine (As Manufactured By Pratt & Whitney) To A McDonnell Douglas Model Engine
72−00−00	ENGINE GENERAL − SPECIAL PROCEDURES−20 • 72−00−00−840−016: Complete The Conversion Of A McDonnell Douglas Model Engine (As Manufactured By Pratt & Whitney) To

	An Airbus Model Engine
72−00−00	ENGINE GENERAL − SPECIAL PROCEDURES−21 • 72−00−00−020−004: Trunnion The Fan Unit (Stage 1 Blades Not Installed) From Horizontal Position To Rear End Down
72−00−00	ENGINE GENERAL − SPECIAL PROCEDURES−22 • 72−00−00−420−004: Trunnion The Fan Unit (Stage 1 Blades Not Installed) From Rear End Down To Horizontal Position
72−00−00	ENGINE GENERAL − SPECIAL PROCEDURES−23 • 72−00−00−910−001: Hydraulic Pump Service And Operation
72−00−00	ENGINE GENERAL − SPECIAL PROCEDURES−24 • 72−00−00−830−006: Adjustment Of The 2.5 Bleed Valve Actuator (Hydraulic)
72−00−00	ENGINE GENERAL − SPECIAL PROCEDURES−25 • 72−00−00−020−005−001: Remove The HPC/Diffuser Assembly From Engine (Horizontal) • 72−00−00−020−005−002: Install HPC/Diffuser Assembly To The Engine (Horizontal)
72−00−00	ENGINE GENERAL − REMOVAL−00 • 72−00−00−990−007: Remove Engine Wire Harnesses
72−00−00	ENGINE GENERAL − REMOVAL−01 • 72−00−00−050−001: Remove No. 1, 1 1/2 And 2 Bearing Oil Pressure Strainer
72−00−00	ENGINE GENERAL − REMOVAL−02 • 72−00−00−050−002: Remove Angle And Main Gearbox Strainer
72−00−00	ENGINE GENERAL − REMOVAL−03 • 72−00−00−050−003: Remove No. 3 Bearing Oil Pressure Strainer (Pre SB PW4ENG 79−52) • 72−00−00−050−003−A: Remove No. 3 Bearing Oil Pressure Strainer (Post SB PW4ENG 79−52)
72−00−00	ENGINE GENERAL − REMOVAL−04 • 72−00−00−050−004: Remove No. 4 Bearing Oil Pressure Strainer
72−00−00	ENGINE GENERAL − REMOVAL−05 • 72−00−00−050−005: Remove HPC Secondary Flow Control Filter Element
72−00−00	ENGINE GENERAL − INSTALLATION−00

	• 72−00−00−990−008: Install Engine Wire Harnesses • 72−00−00−990−009: General Installation Requirements For Electrical Harnesses, Leads And Cables
72−00−00	ENGINE GENERAL − INSTALLATION−01 • 72−00−00−450−001: Install No. 1, 1 1/2 And 2 Bearing Oil Pressure Strainer
72−00−00	ENGINE GENERAL − INSTALLATION−02 • 72−00−00−450−002: Install Angle And Main Gearbox Strainer
72−00−00	ENGINE GENERAL − INSTALLATION−03 • 72−00−00−450−003: Install No. 3 Bearing Oil Pressure Strainer (Pre SB PW4ENG 79−52) • 72−00−00−450−003−A: Install No. 3 Bearing Oil Pressure Strainer (Post SB PW4ENG 79−52)
72−00−00	ENGINE GENERAL − INSTALLATION−04 • 72−00−00−450−004: Install No. 4 Bearing Oil Pressure Strainer
72−00−00	ENGINE GENERAL − INSTALLATION−05 • 72−00−00−450−005: Install HPC Secondary Flow Control Filter Element
72−00−00	ENGINE GENERAL − CLEANING−00 • 72−00−00−990−002: Cleaning
72−00−00	ENGINE GENERAL − CLEANING−01 • 72−00−00−110−001: Clean Last Chance Oil Pressure Strainers
72−00−00	ENGINE GENERAL − CLEANING−02 • 72−00−00−110−003: Clean HPC Secondary Flow Control Filter Element
72−00−00	ENGINE GENERAL − CLEANING−03 • 72−00−00−110−004: Clean Engine Gaspath (Water Wash With Or Without Cleaning Solution) For Performance Improvement (Hose Method) • 72−00−00−110−004−A: Clean Engine Gaspath (Water Wash With Or Without Cleaning Solution) For Performance Improvement (Hook Method)
72−00−00	ENGINE GENERAL − INSPECTION/CHECK−00 • 72−00−00−990−004: Introduction − General
72−00−00	ENGINE GENERAL − INSPECTION/CHECK−01A

	• 72−00−00−990−010: General Borescope Inspection Procedures And Borescope Access Port (AP) Data • 72−00−00−480−001: Installation Of the Rotator Used To Turn The N2 Rotor • 72−00−00−990−011: General Borescope Inspection Procedures And Borescope Access Port (AP) Data • 72−00−00−480−002: Installation Of the Rotator Used To Turn The N2 Rotor
72−00−00	ENGINE GENERAL − INSPECTION/CHECK−01B • 72−00−00−210−003: Perform Borescope Inspection Of Low Pressure Compressor (LPC)
72−00−00	ENGINE GENERAL − INSPECTION/CHECK−01C • 72−00−00−210−004: Perform Borescope Inspection Of High Pressure Compressor (HPC)
72−00−00	ENGINE GENERAL − INSPECTION/CHECK−01D • 72−00−00−210−020: Perform Borescope Inspection Of Combustion Chamber Area (AP−8, AP−9) • 72−00−00−210−029: Perform Borescope Inspection Of Combustion Chamber Area (AP−8)
72−00−00	ENGINE GENERAL − INSPECTION/CHECK−01E • 72−00−00−210−017: Perform Borescope Inspection Of Stage 1 HPT Vanes (AP−8/AP−9) • 72−00−00−210−028: Perform Borescope Inspection Of Stage 1 HPT Vanes (AP−8)
72−00−00	ENGINE GENERAL − INSPECTION/CHECK−01F • 72−00−00−210−005: Perform Borescope Inspection Of Stage 1 HPT Blades And Duct Segments (AP−8/AP−9/ AP−11) • 72−00−00−210−030: Perform Borescope Inspection Of Stage 1 HPT Blades And Duct Segments (AP−8/AP−11)
72−00−00	ENGINE GENERAL − INSPECTION/CHECK−01G • 72−00−00−210−006: Perform Borescope Inspection Of Stage 2 HPT Blades And Duct Segments (AP−10/AP−11)
72−00−00	ENGINE GENERAL − INSPECTION/CHECK−01H • 72−00−00−210−007: Perform Borescope Inspection Of Stage 3 LPT Vanes (AP−10)
72−00−00	ENGINE GENERAL − INSPECTION/CHECK−01I • 72−00−00−210−025: Perform Borescope Inspection Of Stage 3 LPT Blades (AP−10)
72−00−00	ENGINE GENERAL − INSPECTION/CHECK−01J

ENGINE GENERAL - DESCRIPTION/OPERATION-00

Task 72-00-00-990-005:

1. General.

See Figure 1.

NOTE: If not already familiar with fundamentals and theory of the turbofan engine, readers should refer to: The Aircraft Gas Turbine Engine and Its Operation. P&W Operating Instruction (O.I.) 200. Copies of this document have been provided to commercial operators of P&W engines.

A. Engine Specifications

(1) General

Type	Axial-Flow, gas turbine turbofan
Number of Combustion Chambers/type	One/Annular
Type of Compressor	Two spool, 16 stage compressor, consisting of a 5 stage low pressure compressor group (includes high pressure compressor group.
Type of Turbine	6 stage, split, having a 2 stage high pressure turbine group and a 4 stage low pressure turbine assembly.
(Engine Weight Accessories Incl.)	9200 pounds (4173 kg) (approx.)
Engine Length	133 inches (3378 mm) (approx.)
Engine Inlet Diameter	96.00 inches (2438 mm) (approx.)

(2) Ignition System

Ignition Exciter	Bendix
Igniter Plugs	Champion, Auburn
Exciter-to-Igniter Plug Cables	Bendix

(3) Lubrication System

Oil Specification	PWA-521 Type II (SB 238).
Oil System Capacity Fully Serviced (including Oil Tank)	Approximately 40 U.S. Quarts (37.85 liters)
Oil Tank Capacity Manual Fill	Approximately 34.8 U.S. Quarts (17.79 liters)
Pressure Fill	Approximately XX U.S. Quarts (XX liters)
Lubrication And Scavenge Oil Pump	Sundstrand
Air/Oil Heat Exchanger And Valve	Hughes - Treitler, Hamilton Standard

(4) Fuel System

Fuel/Oil Cooler	Serck
Fuel/Oil Cooler Bypass Valve	Parker - Hannifin
Fuel Specification	PWA 522 (SB 2016)
Electronic Engine Control (EEC)	Hamilton Standard
Fuel Distribution Valve	Hamilton Standard
Fuel Pump TRW Fuel Pump Filter Differential Pressure Switch	Custom Component Switches
Fuel Injector And Support	Pratt And Whitney
Fuel Metering Unit	Hamilton Standard

(5) Air System

Stator Vane Actuator Intercompressor (2.5)	Hamilton Standard
Bleed Actuator Turbine Case Cooling	Hamilton Standard
Air Valve Actuator Turbine Case Cooling Air (Shutoff) Valve	Parker Hannifin
(HPT)	Parker Hannifin
Turbine Case Cooling Air (Shutoff) Valve (LPT)	Parker Hannifin
Compressor Heating Air/Start Bleed Valve Solenoid	Midland Ross
Compressor Heating Air/Turbine Vane Cooling Air Valve Solenoid	Midland Ross
Compressor Rotor Heating Air Valves	Midland Ross
2.9 Start Bleed Valves	Midland Ross
Turbine Vane Cooling Air Valves	Midland Ross

B. Directional References

(1) Unless otherwise specified, right and left, clockwise and counterclockwise, upper and lower, and similar directional references apply to engine as viewed from the rear (exhaust end) with engine in a horizontal position and with main accessory section at bottom of engine. The rotation of rotor assemblies is clockwise.

C. Engine Flange Identification.
See Figure 2.

(1) Engine flanges are identified in alphabetical and alphabetical/numerical sequence from front to rear.

D. Borescope Ports.
See Figure 3, Sheets 1 and 2.

(1) Inspection of internal areas of the engine is facilitated by 16 borescope access ports (AP−11 port optional) at specific locations around the engine. These ports permit visual analysis of part condition in areas not otherwise accessible without engine disassembly.

E. Designation Of Engine Stations.
See Figure 4.

(1) Certain specific points along the engine axial profile are identified by station number to provide ease of reference for items such as component locations, test tapes, and sensor locations.

F. Engine Dimensions

(1) The engine without airframe installations is approximately 133 inches (3378 mm) long and 97 inches (2464 mm) across the largest diameter. The engine weight is approximately 9200 pounds (4173 kg).

G. Engine Description

(1) The engine is a two−spool axial flow turbofan engine of high compression and bypass ratio, having 16 compressor stages, an annular combustion chamber, and 6 turbine stages. the low pressure system consists of a five−stage Low Pressure Compressor (LPC) and a four−stage Low Pressure Turbine (LPT) and is mechanically independent of the high pressure system consisting of the 11 stage High Pressure Compressor (HPC) and twostage High Pressure Turbine (HPT). The engine cases, when bolted together, form a structurally rigid support for the engine, with internal parts supported through struts and bearings. The engine mounts are located at the 12 o'clock positions on the intermediate case and turbine exhaust case.

(2) The 1st stage of the Low Pressure Compressor (LPC) rotor, referred to as the "fan", is larger in diameter then the other Compressor stages, and produces two separate airstreams. The primary (inner) airstream passes through the engine gaspath, where is is compressed and employed in the generation of heated gases which provide propulsive force. The secondary (outer) airstream is compressed by the fan and ducted outside the engine, adding to the propulsive force.

H. Main And Angle Gearbox

(1) Main gearbox power to drive the engine and aircraft supplied accessories is obtained from the High Pressure Compressor rotor (HPC). A towershaft in the intermediate case is geared to the front of the rotor.

(2) The towershaft drives the angle gearbox bevel gear set which transmits power to the main gearbox group through the gear−box driveshaft assembly. The angle gearbox is located in the intermediate case group completely enclosed between the fan exit case rear and the intermediate case OD wall.

(3) The main gearbox group incorporates drive pads for the engine fuel pump and fuel metering unit (tandem mounted), engine hydraulic pump(s), the starter, the integrated drive generator system. Provisions are also incorporated to per−mit hand cranking of the high compressor rotor to allow more complete inspection through the borescope ports.

(4) The gearbox engine accessories include an electronic engine control alternator, a lubrication and scavenge oil pump module and an oil filter housing.

I. Main Bearing Numbering And Description

(1) Main bearing locations are commonly referred to by number. Table 1 provides information on bearing location and type. Figure 5 illustrates bearing location.

Bearing No.	Location	Type
1	Low Pressure Compressor Turbine Shaft Coupling	Ball
1.5	Intermediate Case; Turbine Shaft Coupling	Roller
2	Intermediate Case; Rear Compressor Front Hub	Ball
3	Diffuser Case; Rear Compressor Rear Hub	Roller
4	Turbine Exhaust Case; Front Compressor Drive Turbine Shaft	Roller

Main Bearing Identification
Table 1

(2) The No. 1 bearing is a thrust bearing for the Low Pressure Compressor (LPC) and consists of a split inner race, angular contact ball bearing mounted aft of the fan rotor in a relatively cool area. Lubrication and cooling oil is supplied under the inner race and introduced to the bearing through the inner race split.

(3) The No. 1.5 bearing is a standard non-preloaded cylindrical roller bearing which radially supports the low pressure compressor drive turbine shaft coupling. It is mounted at the forward end of the intermediate case. Lubrication for the front seal and the bearing is provided by a single jet directed at the front of the seal plate. Lubrication for the rear seal plate is provided by use of an axial scoop.

(4) The No. 2 bearing is a thrust bearing for the High Pressure Compressor (HPC) and consists of a split inner race, angular contact ball bearing mounted forward of the rear compressor rotor. The lubrication features are similar to the No. 1 bearing.

(5) The No. 3 bearing is a preloaded cylindrical roller bearing mounted forward of the high pressure turbine. The preload to prevent skidding is mechanically applied by grinding the outer surface of the outer race elliptical and the inner surface of outer race round. Mounting this race in a round housing forces the inner

surface to assume an elliptical shape, thereby creating a two−point preload of the bearing. The retainer is a one piece inner land riding cage, silver plated. Cooling oil is fed under the race and lubrication is provided by splash oil from the seal plates and scoop.

(6) The No. 4 bearing is a standard non−preloaded cylindrical roller bearing mounted aft of the front compressor drive turbine. Lubrication features are similar to the No. 3 bearing.

J. Bearing Supports

(1) General

(a) The engine incorporates three main bearing support structures; both the low pressure and high pressure compressor rotors are supported at the front by the intermediate case structure. The high pressure compressor and high pressure turbine are supported by the diffuser case structure and the low pressure turbine is supported by the turbine exhaust case structure.

(b) All bearing support structures consists of a system of inner and outer cones or rings connected through the flow path by airfoil shaped struts.

(2) Intermediate Case Support

(a) The loads from the Nos. 1, 1.5 and 2 bearings are carried by the compressor intermediate case struts across the engine flowpath to the outer case.

(3) Diffuser And Combustion Case Support

(a) The inner section of the diffuser case provides structural support for the No. 3 bearing compartment and is connected radially to the outer section by 24 struts. Bearing loads are carried from the inner case through the struts to the outer case.

(4) Turbine Exhaust Case Support

(a) The inner cone section of the turbine exhaust case provides structural support for the No. 4 bearing compartment. Bearing loads are transferred to the outer case section through 15 radial struts.

K. Bearing Compartment Seal Pressurization.
See Figure 6.

(1) The main bearing carbon seals are pressurized by compressor air to ensure that oil is not permitted to enter the airstream as follows:

(a) No. 1, 1.5 and 2 bearing compartment. See Figure 6 (Sheets 1, 2 and 5).

1 The carbon seals in this area are dry face spring loaded seals.

2 The No. 1 and 2 bearing carbon seals are pressurized by station 2.5 low pressure compressor bleed air.

3 The No. 1.5 bearing carbon seals are pressurized by 9th stage HPC bleed air.

(b) No. 3 Bearing Compartment. See Figure 6 (Sheets 1 and 4).

1 The No. 3 bearing carbon seals are spring−loaded wet face carbon seals.

2 The carbon seals are pressurized by 12th stage HPC bleed air that has passed through an air/air heat exchanger located in the fan exit/intermediate case.

(c) No. 4 Bearing Compartment. See Figure 6 (Sheets 1 and 5).

1 The No. 4 bearing carbon seal is a dry face ring seal.

2 This carbon seal is pressurized by LPC station 2.5 air that enters the LPT shaft forward of the No. 1 bearing.

L. Lubrication System.
See Figure 7.

(1) General

(a) The oil system provides and distributes lubricating oil within specified temperature and pressure limits to the engine main shaft bearings, to the main and angle gearboxes and the accessory drives. It also provides for the return of the lubrication oil to the oil tank through a scavenge system.

(b) The oil system includes a main filter and four last chance screens, pressure relief and bypass valves to ensure flow is maintained, an air/oil heat exchanger and a fuel/oil cooler to maintain desired temperatures and a deoiler and deaerator to remove oil droplets from breather air and entrained air from scavenge oil respectively.

(c) The oil system includes an oil quantity transmitter, oil temperature sensing bulb , oil pressure transmitter, low oil pressure switch, oil filter differential pressure switch, and deaerator vent duct.

(d) The oil indicating system supplies the flight compartment with information regarding the engine oil system. The main gearbox deaerator vent duct provides means for routing breather air overboard.

(2) Pressure System

(a) Oil is supplied to the pressure pump from the tank and is delivered to the main oil filter. In the event of filter clogging, a bypass valve is provided to ensure uninterrupted flow. Instrumentation taps are installed at filter inlet and outlet to provide direct measurement to detect an increase in filter pressure drop. The filtered, pressure oil is then routed through an air/oil heat exchanger and a fuel/oil cooler to maintain desired oil temperature prior to distribution to the main shaft bearings and gearboxes. Each heat exchanger is equipped with a bypass valve which will ensure uninterrupted flow should either exchanger or cooler pressure drop become too high. In the event of an extremely low oil temperature (i.e., a cold start), a temperature bypass valve will bypass the engine fuel/oil cooler.

(b) Once the oil temperature has been regulated, the oil is distributed to the five (5) bearings and the main and angle gearbox. Prior to reaching the desired location, the oil is filtered again by last chance screens which are line replaceable units (lru). The oil is metered to each compartment by flow restrictors. These restrictors are required to maintain proper flow levels which tend to be elevated due to higher supply pressures inherent with a non−regulated system.

(3) Components

(a) Oil Quantity Transmitter

1 The oil quantity transmitter measures the oil quantity in the engine oil tank and is installed in the top of the tank, located on the left side of engine. Operating on 115 VAC the transmitter consists of a reed switch potentiometer and a float with an integral permanant magnet. The transmitter is not adjustable at field maintenance level.

(b) Oil Temperature Sensing Bulb

1 The oil temperature bulb senses the oil temperature down line from the engine fuel/oil cooler, and is located on the top aft portion of the engine fuel/oil cooler, on the right side of engine. Operating on 28VDC, the temperature sensor is a resistance−type bulb that consists of an element hermetically sealed in an insulating material within a housing.

(c) Oil Pressure Transmitter

1 The oil pressure transmitter is located above the forward end of the fuel flow meter on the right side of the engine. The oil pressure is measured before entering the main bearings. Operating on 28VDC the transmitter is a diaphragm type and is not adjustable at field level maintenance.

(d) Low Oil Pressure Switch

1 The low oil pressure transmitter is located above the aft end of the fuel flow transmitter on the right side of the engine and measures oil pressure before entering the main bearings. Operating on 29VDC the transmitter is a diaphragm type with dual contacts. It trips at 38 − 42 psi (262.0 − 289.6 kPa) when the engine is building up oil pressure and 34 − 38 psi (234.4 − 262.0 kPa) when losing oil pressure.

(e) Oil Filter Differential Pressure Switch

1 The oil filter differential pressure switch is located below the forward end of the engine/oil tank, on the left side of the engine. The switch measures the difference between the high pressure port and the low pressure port of the main oil filter. When the differential pressure across the main oil filter reaches 48 − 52 psi (330.9 − 358.5 kPa), the pressure switch diaphragm and mechanical linkage actuate the switch to the closed position. The circuit is completed and a caution light comes on, signaling filter element clogging. When pressure decreases to 38 − 42 psi (262.0 − 289.6 kPa) the caution light goes out.

(4) Scavenge System

(a) Oil collecting in the main bearing compartments and the gearboxes is returned to the oil tank by use of individual scavenge pumps which are located in the same module as the main oil pump. At the inlet to each pump is a chip detector. All scavenge oil returning to the tank via the scavenge system passes through a deaerator to remove the entrained air.

(5) Breather System

(a) Breather air, resulting from air leakage past the knife−edge and carbon seals, is routed from the Nos. 1, 1.5, 2 and 3 bearing compartments to the external deoiler on the gearbox front face.

(b) The No. 4 compartment has its breather air/scavenge oil returned to the tank via the scavenge pump for the No. 4 bearing. The entrained air is removed via the deaerator in the oil tank.

M. Engine Fuel And Control Systems.
See Figure 8.

(1) The function of the PW4000 engine control system is to provide automatic regulation of engine power settings when initiated by the pilot. The system also provides diagnostic information which enhances aircraft line maintenance and dispatch readiness by identifying faulty engine components.

(2) The engine control system consists of a dual channel, full authority digital electronic engine control (EEC) which interfaces with aircraft and engine control components as illustrated in Figure 8. Power to each control channel is provided by a dedicated, engine gearbox−driven alternator. All essential control system input sensors and output actuators are also dual redundant providing high operational reliability.

(3) The system is comprised of individually part−numbered components mounted on the engine. The components are classified into the following functional groups.

(a) Engine fuel and control components.

(b) Compressor bleed, compressor stator vane control, compressor and turbine active clearance control, and turbine vane cooling components.

(c) Oil system components (includes engine and aircraft IDG air/oil heat exchangers).

(d) An instrumentation package, available as optional equipment, for engine condition monitoring and diagnostic purposes.

(4) All the components either provide inputs to the EEC or implement the EEC electrical output command signals. All output devices use either hydraulic or pneumatic (muscle) pressure. Hydraulic pressure is supplied by the engine fuel metering unit. Pneumatic pressure is supplied by the engine compressor.

(5) Referring to Figure 8, the aircraft fuel system supplies fuel to the engine fuel pump at the required inlet conditions. The engine Pump supplies fuel to the fuel metering unit for control of engine fuel flow, and also to the Engine/IDGS fuel/oil cooler for the purposes of fuel de−icing and engine oil cooling. The fuel metering unit (FMU) contains a torque motor which responds to commands from the EEC to position the metering valve. Metered fuel from the fuel metering unit is delivered to the fuel distribution valve, which divides the fuel equally among eight manifolds, each of which feed three single−orifice fuel injectors. Fuel shut−off and pressurization are accomplished with an electrical signal from the aircraft pilot stand to the fuel shutoff motor on FMU.

(6) The EEC provides the full range of control required to modulate engine fuel flow, high compressor stator vanes, low and high turbine case cooling, engine air/oil cooling, and 2.5 compressor bleed flow. These functions are all provided by torque motor controlled hydraulic actuators.

(7) To ensure reliability of the system, redundant torque motors and feedback elements are used. Fuel pump discharge pressure, filtered through a fine wash−flow filter in the fuel metering unit, provides hydraulic pressure for the actuators.

(8) The electronic control schedules discrete signals for solenoid on−off operation to control the IDGS air/oil cooler override and the fuel/oil cooler bypass valve. The compressor starting bleeds, high compressor active clearances, and high turbine blade and vane cooling are pneumatically controlled by solenoids.

(9) Information supplied to the EEC by the aircraft includes throttle position, service bleed status, altitude, and total air pressure and temperature at engine inlet. Engine−mounted sensors provide the EEC with measurements of engine temperatures, pressures, and speeds.

(10) The electronic engine control provides digital data by dual data busses for use by the aircraft.

(11) The system provides simplified engine operation procedures either with or without the aircraft autothrottle. The control of pilot−selected thrust settings, coupled with aircraft thrust setting procedures and cockpit displays provides an integrated system which greatly simplifies the task of aircraft thrust management. This electronic engine control system requires no trimming.

N. Ignition System

(1) The ignition system consists of two independent exciters, two high−tension leads and two igniters. The exciters are designed for 4 joule continuous duty operation. Each exciter is AC powered and fires one recessed−gap spark igniter through an air−cooled steel conduit high−tension lead. Each exciter is contained in a separate housing and mounted on vibration isolators that attach to bracket on main gearbox.

(2) Ignition exciter spark repetition rate is a minimum of one spark per second at 115 VAC, 400 HZ. The open circuit output voltage of each exciter is nominally 24KV.

(3) The complete ignition system is capable of open−circuit operation (igniters quenched) when operated to a continuous duty cycle.

O. Compressor Stator Vane Control System.
See Figure 9.

(1) The variable vane system provides optimum engine performance throughout the engine operating envelope by varifing compressor airflow.

(2) Variable geometry stator vanes are incorporated on the inlet guide vanes and the 5th, 6th and 7th stages of the high pressure compressor. Stator vane actuator position is scheduled as a function of low rotor speed (N1), high rotor speed (N2) and engine inlet total temperature (T2). The Electronic Engine control interfaces with the stator vane actuator through a pilot valve positioned by a dual coil torque motor. Stator vane actuator position is sensed by dual, temperature compensated, linear variable differential transformers (LVDT) and fed back to the Electronic Engine Control.

(3) The pilot valve, torque motor and LVDT's are integral with the stator vane actuator. The actuator is powered by hydraulic pressure supplied by the fuel pump. The relative scheduling of the four stator vane stages is controlled by a fixed geometry linkage driven by the stator vane actuator. The actuator piston linear motion is transmitted to the variable vanes through a mechanical linkage which includes one bellcrank, four adjustable links (one per stage), four unison rings (one per stage), and 230 connector links (one per vane).

(4) At low engine RPM the variable vanes are positioned in the closed direction allowing minimal airflow through the compressor. At high engine RPM the variable vanes are open allowing maximum airflow through the compressor. The vanes begin to close if an impending surge is detected by the EEC. In the event of loss of the electrical signal to the actuator the system is designed to open the vanes.

P. 2.5 Bleed System.
See Figure 10.

(1) The 2.5 bleed system provides increased compressor stability during starting, transient and reverse thrust operation.

(2) The Electronic Engine Control (EEC) modulates the 2.5 bleed valve actuator to a schedule determined by thrust lever angle, low rotor speed (N1), high rotor speed (N2), mach number, engine inlet total temperature (T2) and altitude. The actuator piston linear motion is transmitted by mechanical linkage and a series of cams and rollers to position the 360 degree translating ring type 2.5 bleed valve.

(3) During engine start the bleed valve is translated to the full open position venting low pressure compressor discharge (4th stage compressor) air into the fan stream. The valve is fully open at idle. As engine power is increased the valve is modulating to its fully closed position. It is commanded to its full open position during rapid engine decelerations, reverse thrust operation or if an impending surge is detected.

(4) The EEC interfaces with the intercompressor (2.5) bleed actuator through a pilot valve positioned by a redundant coil torque motor. Intercompressor (2.5) bleed actuator position is sensed by dual rotational variable transformers (RVT) and fed back to the EEC. The pilot valve, torque motor and RVT's are integral with the intercompressor (2.5) bleed actuator assembly. The actuator is powered by hydraulic pressure supplied by the fuel pump. In the event of loss of electrical signal to the actuator the system is designed to open the 2.5 bleed valve.

Q. 2.9 Bleed System.
See Figure 11.

(1) The two 9th stage compressor bleeds, (compressor bleed control system) provide increased compressor stability during starting and transient operation. The bleeds are controlled as a function of high rotor speed (N2) and engine inlet total temperature (T2). The Electronic Engine Control (EEC) interfaces with the compressor bleed valves through two redundant coil solenoid valve assemblies. The two solenoid valves are remotely mounted as part of a single assembly.

(2) During most of the engine start cycle, both 9th stage compressor bleeds are commanded open, venting 9th stage compressor air into the fan stream. Both bleeds close at approximately two percent N2 below idle. The start 2.9 bleed (right bleed) remains closed during all engine operation. The stability 2.9 bleed (left bleed) is opened for a maximum of two seconds if the engine is decelerated to below eighty−one percent N2 and is also opened if an impending engine surge is detected.

(3) The 9th stage bleed valves are two position (open/closed) poppet design valves which are spring loaded open. The poppets are closed by compressor discharge pressure routed through the EEC controlled solenoid valves.

R. Turbine Case Cooling.
See Figure 12.

(1) The exterior surfaces of the high and low pressure turbine cases are cooled with engine fan discharge air to control turbine blade tip clearance for performance improvement. The turbine case cooling actuator position is scheduled as a function of altitude and

high rotor speed (N2). The electronic engine control (EEC) interfaces with the turbine case cooling actuator through a pilot valve positioned by a redundant coil torque motor. Turbine case cooling actuator position is sensed by dual linear variable differential transformers (LVDT) and fed back to the EEC.

(2) The pilot valve, torque motors and LVDT's are integral with the turbine case cooling actuator. The actuator is powered by hydraulic pressure supplied by the fuel pump. The linear motion of the actuator piston is transmitted to the high and low pressure turbine case cooling air valves by a push−pull cable. The high and low pressure turbine case cooling air valves (one each) are mechanically actuated, fully modulated spring loaded closed butterfly valves mounted in tandem with a common inlet. The relative schedule of each valve is controlled by a single fixed geometry mechanical linkage which starts to open the low pressure turbine case cooling air shut−off valve before the high pressure turbine case cooling air shut−off valve starts to open. In the event of loss of electrical power, hydraulic pressure or mechanical connection, the system is designed to close the cooling air valves.

Task 72-00-00-010-001:

1. Transfer Engine From Transport Stand To Pedestals

A. Equipment And Materials Required

Special Tools:

PWA 25040	Bracket, Support (Optional To PWA 85195 Bracket For Engines With Exhaust Nozzle Removed)
PWA 25041	Bracket, Support (Optional To PWA 85195 Bracket For Engines With Exhaust Nozzle Removed)
PWA 25757	Pedestal (Non-Adjustable, Three Required)
PWA 25758	Pedestal (Adjustable)
PWA 25926	Adapter (Three Required)
PWA 28414	Bracket, Support (Two Required) (Optional To PWA 85195 Brackets For Engine Horizontal Support)
PWA 29243	Support Bracket (Two Required - Optional To PWA 85195 Brackets For Engine Horizontal Support)
PWA 85195	Support Bracket (Two Required)
PWA 85452	Rear Lifting Eye
PWA 85623	Front Lifting Eye
PWA 85662	Support Bracket (Two Required - Optional To PWA 85667)
PWA 85667	Support Bracket (Two Required)

NOTE: (PWA 28414) and (PWA 29243) may be used in place of (PWA 85195) Brackets for engine horizontal support only.

(PWA 25040) and (PWA 25041) Brackets may be used in place of (PWA 85195) Brackets on engines with exhaust nozzle removed.

B. Procedure

See Figures 201 and 202.

NOTE: If there is a bolt in one of the holes of the 12 o'clock ground handling pad that you cannot remove, you must repair the intermediate case. Refer to 72-00-34, Repair-01 (Task 72-00-34-300-001).

(1) Position PWA 85623 Front Lifting Eye (201/5) to ground handling boss at 12 o'clock location on outer intermediate case. Secure lifting eye to case boss with bolts (201/4). Torque bolts to 675 - 750 lb-in. (76.265 - 84.739 N.m).

Position Engine On Pedestals
Figure 202 (Sheet 2)
(Task 72−00−00−010−001)

(2) Position PWA 85452 Rear Lifting Eye (201/1) to engine turbine exhaust case. Align attachment block details to bushing holes in case rails at 2 and 10 o'clock. Install pins (201/2) through bushings and blocks. Secure pins with safety clips.
(3) Attach hoist to each lifting eye.
(4) Disconnect/remove transport stand to engine attachment devices as applicable.
(5) Lift and remove engine from transport stand.
(6) Move transport stand or engine as applicable to clear area.
(7) Install PWA 85195, PWA 29243, PWA 25040 and PWA 25041, or PWA 28414 Support Brackets to turbine exhaust case at 3 and 9 o'clock locations. See Figure 202.

NOTE: Brackets (PWA 29243) or (PWA 28414) may be used in place of Brackets (PWA 85195) for horizontal support only.

Brackets (PWA 25040) and (PWA 25041) may be used in place of PWA 85195 on engines with exhaust nozzle removed.

(a) Position brackets between case rails and align holes.

NOTE: If applicable, install Bracket PWA 25040 at 3 o'clock and PWA 25041 at 9 o'clock positions.

(b) For Brackets (PWA 85195) or (PWA 25040) and (PWA 25041), install pin from rear through flange and bracket. Secure pin with safety pin as required.
(c) For other brackets, insert pin through flanges and bracket and install bushings through flanges and into bracket. Secure pins with nuts.

(8) Position PWA 85662 or PWA 85667 Support Brackets to ground handling bosses at 3 and 9 o'clock locations on engine outer intermediate case. Secure brackets to engine case with four bolts through each bracket. Torque bolts to 675 - 750 lb-in. (76.265 - 84.739 N.m).

(9) Position three PWA 25757 Pedestals and one PWA 25758 Pedestal under brackets at exhaust and intermediate cases.

NOTE: Two non-adjustable pedestals are to be positioned at intermediate case location.

One non-adjustable pedestal and one adjustable pedestal are to be positioned at exhaust case location.

(10) Install PWA 25926 Adapters to three non-adjustable (PWA 25757) Pedestals. Secure adapters to pedestals with bolts.
(11) Turn jackscrew detail of adjustable pedestal to position lower than non-adjustable pedestals.
(12) Align pedestals with brackets on engine cases.
(13) Lower engine to engage bracket inboard spools with adapters on non-adjustable pedestals.

CAUTION: YOKE OF ADJUSTABLE PEDESTAL MUST BE IN COMPLETE CONTACT WITH SPOOL OF BRACKET TO PROVIDE ACCEPTABLE POWER PLANT SUPPORT.

(14) Turn jackscrew detail of adjustable pedestal to raise yoke and engage inboard spool of bracket.
(15) Ensure pedestals are in vertical position with no side loading and lower engine to position full weight on four pedestals. Remove hoists.
(16) Remove bolts securing lifting eye at 12 o'clock position on engine intermediate case. Remove lifting eye.
(17) Remove safety clips and pins securing lifting eye to engine exhaust case. Remove lifting eye.

Previous Pageblock Return to Previous Menu Next Pageblock

ENGINE GENERAL - SPECIAL PROCEDURES-02

Task 72-00-00-410-001:

1. Transfer Engine From Pedestals To Transport Stand

A. Equipment And Materials Required

Special Tools:
PWA 85452 Rear Lifting Eye
PWA 85623 Front Lifting Eye

B. Procedure
See Figures 201 and 202.

NOTE: If there is a bolt in one of the holes of the 12 o'clock ground handling pad that you cannot remove, you must repair the intermediate case. Refer to 72-00-34, Repair-01 (Task 72-00-34-300-001).

(1) Position PWA 85623 Front Lifting Eye (201/3) to ground handling boss at 12 o'clock location on outer intermediate case. Secure lifting eye to boss with bolts (201/4). Torque bolts to 675 - 750 lb-in. (76.265 - 84.739 N.m).
(2) Position PWA 85452 Rear Lifting Eye (201/1) to engine exhaust case. Align attachment block details to bushing holes in case rails at 2 and 10 o'clock. Install pins (201/2) through bushings and blocks. Secure pins with safety clips.
(3) Attach hoist to each lifting eye. Lift engine from pedestals.
(4) Remove bolts securing support brackets to engine intermediate case at 3 and 9 o'clock. Remove brackets.
(5) Remove safety clips and pins securing support brackets to engine exhaust case at 3 and 9 o'clock. Remove brackets.
(6) Position engine to transport stand and secure with applicable attachment devices. Remove hoists. See Figure 202.
(7) Remove bolts securing front lifting eye at 12 o'clock position on engine intermediate case. Remove lifting eye.
(8) Remove safety clips and pins securing rear lifting eye to engine exhaust case. Remove lifting eye.

Task 72-00-00-830-001:

1. Rig 2.5 Bleed Valve Actuator (Manual)

A. General

(1) This procedure permits the 2.5 bleed valve actuator to be rigged manually. To hydraulically rig the 2.5 bleed valve actuator, see 72-00-00, Special Procedure-24 Task 72-00-00-830-006.

B. Equipment And Materials Required

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
R P06-054	Paste, Anti-Seize (PWA 36246)
P09-014	Sealant, Silicon Rubber (PWA 36003)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Cotter Pin	1	75-32-00/1/50

C. Procedure

See Figure 201.

CAUTION: TO AVOID SHOULDER BOLT (201/5) DAMAGE, BE AWARE THAT SHOULDER BOLT IS LEFT HAND THREAD. HOLD ACTUATOR PISTON SHAFT HEX (201/3) WHILE LOOSENING SHOULDER BOLT.

CAUTION: MAKE SURE THE CRIMPED LOCKING CUP AND RETAINING NUT DO NOT LOOSEN FROM THE PISTON SHAFT WHEN THE SHOULDER BOLT IS REMOVED.

(1) If not previously accomplished, remove cotter pin (201/6) from shoulder bolt (201/5) on actuator piston shaft (201/3) and while holding piston shaft, remove shoulder bolt.

CAUTION: MAKE SURE THE CRIMPED LOCKING CUP AND RETAINING NUT DO NOT LOOSEN FROM THE PISTON SHAFT WHEN THE PISTON SHAFT HEX IS ROTATED. IF THE RETAINING NUT CHANGES OR LOOSENS, THE INTERNAL ADJUSTMENT OF THE ACTUATOR CAN BE AFFECTED AND ACTUATOR OR ENGINE DAMAGE CAN OCCUR.

CAUTION: DO NOT USE EXCESSIVE FORCE WHEN ROTATING THE PISTON SHAFT BECAUSE INTERNAL DAMAGE TO THE ACTUATION COULD RESULT.

(2) Install a speed handle and socket on the hex end of the piston shaft (201/3). Rotate the piston shaft clockwise (as viewed from the rear) until the shaft rotation stops.

(3) Rotate the piston shaft counterclockwise (as viewed from the rear) four turns.

CAUTION: TO AVOID SHOULDER BOLT (201/5) DAMAGE, BE AWARE THAT SHOULDER BOLT IS LEFT HAND THREAD. HOLD ACTUATOR PISTON SHAFT HEX WHILE TORQUING SHOULDER BOLT.

(4) Holding piston shaft hex (201/3) to prevent rotation, install shoulder bolt (201/5), threads lubricated with Engine Oil P03−001 to piston shaft. Torque shoulder bolt to 50 − 70 lb−in. (5.649 − 7.909 N.m).

NOTE: Shoulder bolt may be rotated 30 degrees maximum in either direction to install cotter pin and can cause acceptable torques not in the torque range given in the previous step.

(5) Install cotter pin (201/6) to secure shoulder bolt. See 70−00−00, Standard Practices Manual, PN 585005.

(6) If necessary, install bleed valve actuator pressure and return tubes.

(a) Remove protective closures.

(b) Lubricate return tube (CR02) nut threads with Engine Oil P03−001 and connect to manifold tee and to actuator adapter (201/2).

R (c) Lubricate the pressure tube (CP06) nut threads with Anti-Seize Paste P06-054 and connect tube to the manifold tee and to the actuator adapter (201/1). Remove the unwanted paste.

(d) For post SB PW4ENG 75-45 engines, install clamps, bolt, lubricated with Engine Oil P03-001, and nut that attach the tube together. Torque the clamp bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) Torque return tube (CR02) nuts to 270 - 300 lb-in. (30.506 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(f) Torque pressure tube (CP06) nut at manifold tee to 340 - 375 lb-in. (38.415 - 42.369 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(g) Torque pressure tube (CP06) nut at actuator to 225 - 250 lb-in. (25.422 - 28.246 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(7) Clean shoulder bolt cotter pin area at both ends by SPOP 208 Wipe Method (Task 70-21-00-110-040). Surfaces shall be thoroughly dried in ambient temperatures. Drying time shall be sufficient to remove traces of solvent detrimental to sealant. Apply Sealant P09-014 to both ends of cotter pin.

D. Postrequisites

(1) Install the fan exit liner segment (inner rear) that you removed. Refer to 72-00-33, Installation-16 Task 72-00-33-440-001.

(2) Test engine per Test Reference Table. See 71-00-00, Testing-00 Task 71-00-00-990-003.

Task 72−00−00−830−002−A:

1. Rig Variable Stator Vane Actuator − (Hydraulic Procedure)

A. General

WARNING: DO NOT PUT YOUR FINGERS IN THE WAY OF THE LINKAGES, UNISON RINGS, OR LEVERS WHEN YOU OPERATE THE STATOR VANE SYSTEM.

CAUTION: IT IS VERY IMPORTANT TO DO THIS HYDRAULIC RIGGING PROCEDURE WITH PRECISION. BAD RIGGING CAN CAUSE INCREASED HPC BLADE FATIGUE, INTERNAL ENGINE DAMAGE, OR COMPLETE ENGINE FAILURE.

CAUTION: ALWAYS REMOVE ALL RIG PINS BEFORE YOU MOVE THE STATOR VANE SYSTEM OR DAMAGE CAN RESULT.

NOTE: This hydraulic rigging procedure is the preferred method over the mechanical procedure given in Paragraph 2. Task 72−00−00−830−002−B00. This hydraulic rigging procedure puts a load on the system. This hydraulic load is more equivalent to the load caused during engine operation than the mechanical procedure load.

NOTE: Refer to ENGINE GENERAL − SPECIAL PROCEDURES−23, Task 72−00−00−910−001 for Hydraulic Pump Service And Operation of the PWA 49030 Hydraulic Pump or the CTE 5100 Hydraulic Pump.

B. Equipment And Materials Necessary

Standard Tools:

Glenair TG−70	Strap Wrench Or
Glenair TG−69	Soft Jawed Pliers
Bergen Mechanical Crimper	(Optional) Model M303, M305 or M307

Special Tools:

PWA 29451	Adapter
PWA 49030	Hydraulic Cart (Pneumatic) (Optional To CTE 5100)
PWA 85395	Rig Pin (Pre SB PW4ENG 72−246)
PWA 86097	Rig Pin (Post SB PW4ENG 72−246)
PWA 86317	Electrical Switch Box (Preferred)
PWA 101618	Adapter Elbow 90° (Optional)

Special Tools:

(CONTINUED)

CTE 5100	Hydraulic Cart (Pneumatic) Optional To PWA 49030)

NOTE: The PWA 85675 Rigging Pin Kit contains the above rig pins.

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P03-003	Fluid, Calibrating
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
R P06-054	Paste, Anti-Seize (PWA 36246)
P11-009	Alcohol, Denatured Ethyl (AMS 3002)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Cotter Pin	1	75-31-00/1/170
Seal	1	75-31-00/1/240

C. Procedure
See Figure 201 and 202.

WARNING: DO NOT LET ENGINE FUEL STAY ON YOUR SKIN FOR A LONG TIME. THE FUEL IS POISONOUS AND CAN GO THROUGH YOUR SKIN. PUT A CONTAINER, MINIMUM CAPACITY OF 5 U.S. GALLONS (19 liters), IN POSITION AND COLLECT THE DRAINED FUEL.

(1) If not done, remove the lockwire and disconnect the compressor stator hydraulic pressure tube (CP12) at both ends. Remove the lockwire and disconnect the compressor stator hydraulic return tube (CR03) at both ends. Loosen both clamp bolts and position the tubes away from the actuator adapters. Install the protection covers.

(2) Install the PWA 49030 Hydraulic Cart or CTE 5100 Hydraulic Cart as follows.

NOTE: If you do not know which pump to use, refer to Engine General - Special Procedures-23, Task 72-00-00-910-001 for Hydraulic Pump Service And Operation of the PWA 49030 Hydraulic Pump or the CTE 5100 Hydraulic Pump.

(a) Install the PWA 29451 Adapter to the actuators pressure adapter (Port PF). See Figure 201 (Sheet 1).

(b) Tighten and torque the PWA 29451 Adapter to 225 - 250 lb-in. (25.422 - 28.246 N.m).

NOTE: Hold the actuator adapter while you torque the tool adapter.

(c) Install the hydraulic pressure hose to the PWA 29451 Adapter.

NOTE: If necessary, use a standard 45 degree elbow or 90 degree PWA 101618 Adapter on the end of hydraulic pressure hose.

(d) Install the hydraulic return hose to the actuators return adapter (Port PFR).

(e) Hold the adapters with a wrench and torque the nuts on pressure hose and return hose to 200 - 225 lb-in. (22.597 - 25.422 N.m).

(3) With the power OFF, install the PWA 86317 Electrical Switch Box as follows.

NOTE: Although the PWA 86317 Electrical Switch Box is preferred, if the electrical switch box is not available, you can do a check of the stator vane actuater rigging without the box. Go to step (4).

(a) If not done, Disconnect the W4P3 and the W5P7 harness connectors from the stator vane actuator electrical receptacles "J7" and "J3". Install protection covers to the connectors. See Figure 201 (Sheet 2).

(b) Install the electrical lead from the electrical switch box to the upper receptacle on the stator vane actuator marked "J7".

(4) If not done, make the initial rod end bearing (202/3) adjustment as follows.

(a) Turn the actuator piston rod (202/6) until the flat surface below the hex of the rod end bearing is approximately 9/16 inch (14.288 mm) from the flat surface below the actuator rod threads. See Figure 202 (Sheet 1). This is the approximate initial adjustment only.

NOTE: You can turn the actuator piston rod for this adjustment only with no hydraulic pressure to the (Port PF).

(5) Service the hydraulic pump with Calibrating Fluid P03-003.

NOTE: If you do not know how to service the hydraulic pump, refer to Engine General - Special Procedures-23, Task 72-00-00-910-001 for Hydraulic Pump Service of the PWA 49030 Hydraulic Pump or the CTE 5100 Hydraulic Pump.

WARNING: MAKE SURE ALL PERSONS AND TOOLS ARE AWAY FROM THE MECHANICAL PARTS OF THE STATOR VANE ACTUATOR. WHEN YOU START THE PUMP, THE ACTUATOR CAN MOVE. IF YOU DO NOT DO THIS, YOU CAN CAUSE INJURY OR DAMAGE THE ENGINE.

(6) Operate the PWA 49030 Hydraulic Pump or the CTE 5100 Hydraulic Pump to fully extend the actuator rod (vanes open).

NOTE: If you do not know how to operate the hydraulic pump, refer to Engine General - Special Procedures-23, Task 72-00-00-910-001 for operation instructions of the PWA 49030 Hydraulic Pump or the CTE 5100 Hydraulic Pump.

(a) If a pneumatic driven hydraulic pump is used, supply 25 - 30 psig (172.4 - 206.8 kPa) air pressure to the pumps air gage.

(b) Supply 250 - 300 psig (1723.7 - 2068.4 kPa) hydraulic pressure to the stator vane actuator (Port PF).

(7) Push the power switch or the electrical box to the on position. Push the actuator switch to the extend position. See Figure 201 (Sheet 2).

NOTE: The actuator piston rod is fully extended at this time (vanes open).

(8) Adjust the actuator rod end bearing (202/3) as follows.

CAUTION: BE SURE THE ACTUATOR ROD STAYS FULLY EXTENDED WHEN YOU INSTALL THE BELLCRANK RIG PIN. IF THE ACTUATOR ROD IS ALLOWED TO RETRACT, THE VARIABLE STATOR VANES WILL OVERTRAVEL WHICH MAY RESULT IN HARMFUL STABILITY AND/OR DURABILITY EFFECTS.

CAUTION: BE SURE AND USE THE CORRECT BELLCRANK RIG PIN. USE THE LARGER PWA 85395 RIG PIN FOR (PRE SB PW4ENG 72-246 ENGINES). USE THE SMALLER PWA 86097 RIG PIN FOR (POST SB PW4ENG 72-246 ENGINES).

CAUTION: MAKE SURE THAT THE END OF THE RIG PINS ARE PROPERLY AND FULLY INSTALLED.

(a) Adjust the rod end bearing (202/3) so you can put the bellcrank PWA 85395 Rig Pin or PWA 86097 Rig Pin into the rig pin slot of the bellcrank arm (202/12) and into both holes of the support (202/11) with the hydraulic pressure on.

NOTE: During actuator rod end adjustments only, you can temporarily reduce the hydraulic pressure to 0 psig. You can turn the actuator piston rod for the last small adjustment.

(b) Lock the rod end bearing to the actuator rod with the jamnut (202/5). Torque the jamnut (202/5) to 460 - 510 lb-in. (51.973 - 57.622 N.m).

CAUTION: REMOVE ALL THE RIG PINS FROM THE UNISON RINGS AND THE BELLCRANK BEFORE YOU CONTINUE OR DAMAGE CAN RESULT.

(c) Remove the bellcrank rig pin. Push the actuation switch (201/6) on the electrical switch box to retract and extend the actuator several times through full travel. Stop with the rod fully extended. Go to step (e).

NOTE: If an electrical switch box is not available continue with step (d).

(d) If the PWA 86317 Electrical Switch Box is not available, operate the stator vane system as follows.

1 If an air supply is used, turn the air supply valve knob to the closed position (perpendicular to flow).

2 Use a crowsfoot and wrench on the flats of the bellcrank (202/1). Push the wrench up and move the system to the closed position. Remove the wrench.

3 Operate the hydraulic cart and supply 250 − 300 psig hydraulic pressure to the actuator PF port. Fully extend the actuator rod (202/6) to the full open position. The stator vane actuator piston is now extended against the internal stop. Do step (d) again one more time.

(e) With the actuator rod (202/6) extended fully (vanes open), install the bellcrank rig pin in the rig pin slot (202/12) of the bellcrank arm and both holes of the support (202/11). If you can not install the rig pin, do the rod end adjustment again in step (6). If you can install the rig pin, lock the jamnut (202/5) and rod end (202/3) with the key washer (202/4). Bend one set of tabs onto the rod end bearing (202/3) and the other set onto the jamnut (202/5). Install the Lockwire P05−289 and seal (202/7). See 70−53−00, Standard Practices Manual, PN 585005.

(f) Torque the rod end bearing retaining bolt nut (202/10) to a minimum of 15 lb-in. (1.695 N.m) plus the torque necessary to turn the nut on the bolt (202/2). Continue and torque the nut until the slot in the nut aligns with the hole in the bolt. This torque must not be more than 22 lb-in. (2.486 N.m) plus the torque necessary to turn the nut on the bolt. Install the cotter pin (202/9) to the nut. Bend the cotter pin. See the 70-53-00, Standard Practices Manual, PN 585005.

CAUTION: REMOVE ALL THE RIG PINS FROM THE UNISON RINGS AND THE BELLCRANK BEFORE YOU CONTINUE OR DAMAGE CAN RESULT.

(9) Remove the rig pin.

(10) After the adjustment, disconnect the pumps hydraulic pressure hose and return hose from the actuator. Refer to Engine General - Special Procedures-23, Task 72-00-00-910-001 for operation instructions of the PWA 49030 Hydraulic Pump or the CTE 5100 Hydraulic Pump.

(11) Remove the PWA 29451 Adapter from the (Port PF).

NOTE: Hold the adapters while you disconnect the hoses and tool adapter.

(12) Push the power switch (201/3) on the electrical switch box to off. Disconnect the electrical connector from the actuator.

(13) Connect the W4P3 and the W5P7 harness connectors to the actuator harness receptacles as follows. For each connector:

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11-009. Let the connector and receptacle dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 Strap Wrench or the Glenair TG−69 Soft−jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal). This procedure will make sure the contacts are sufficiently engaged and the connector is tight.
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(14) Install the compressor stator cylinder hydraulic pressure tube assembly (CP12).

R R R (a) Remove the protective covers. Lubricate the tube adapter threads at each end with Anti−Seize Paste P06−054. Remove the unwanted paste.

(b) Install the tube nuts to the larger adapter on the actuator and to the hydraulic manifold tee handtight only.

(c) Torque the clamp bolt, lubricated with Engine Oil P03−001, to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(d) Torque the tube nuts to 225 - 250 lb-in. (25.422 - 28.246 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(15) Install the compressor stator cylinder hydraulic return tube assembly (CR03).

R (a) Remove the protective covers. Lubricate the tube
R adapter threads at each end with Anti-Seize Paste
R P06-054. Remove the unwanted paste.

(b) Install the tube nuts to the smaller adapter on the actuator and to the inlet return manifold tee handtight only.

(c) Torque the clamp bolt, lubricated with Engine Oil P03-001, to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(d) Torque the tube nuts to 225 - 250 lb-in. (25.422 - 28.246 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

D. Postrequisites

CAUTION: BE SURE YOU REMOVE ALL RIG PINS AND TOOLS FROM THE ENGINE OR ENGINE DAMAGE CAN RESULT.

(1) Test engine per Test Reference Table. See 71-00-00, Testing-00 Task 71-00-00-990-003.

Task 72-00-00-830-002-B:

2. Rig Variable Stator Vane Actuator - (Mechanical Procedure)

A. General

WARNING: DO NOT PUT YOUR FINGERS IN THE WAY OF THE LINKAGES, UNISON RINGS, OR LEVERS WHEN YOU OPERATE THE STATOR VANE SYSTEM.

CAUTION: IT IS VERY IMPORTANT TO DO THIS MECHANICAL RIGGING PROCEDURE WITH PRECISION. BAD RIGGING CAN CAUSE

INCREASED HPC BLADE FATIGUE, INTERNAL ENGINE DAMAGE, OR COMPLETE ENGINE FAILURE.

CAUTION: ALWAYS REMOVE ALL RIG PINS BEFORE YOU MOVE THE STATOR VANE SYSTEM.

NOTE: Also see the preferred hydraulic procedure in Paragraph 1, Task 72-00-00-830-002-A00.

B. Equipment And Materials Necessary

Special Tools:

PWA 85395	Rig Pin (Pre SB PW4ENG 72-246)
PWA 86097	Rig Pin (Post SB PW4ENG 72-246)
PWA 86344	Holder, Rigging

NOTE: The PWA 85675 Rigging Pin Kit contains the above rig pins.

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Cotter Pin	1	75-31-00/1/170
Seal	1	75-31-00/1/240

C. Procedure
See Figure 203.

CAUTION: BE SURE AND USE THE CORRECT BELLCRANK RIG PIN. USE THE LARGER PWA 85395 RIG PIN FOR (PRE SB PW4ENG 72-246 ENGINES). USE THE SMALLER PWA 86097 RIG PIN FOR (POST SB PW4ENG 72-246 ENGINES).

CAUTION: BE SURE THAT THE END OF THE RIG PINS ARE PROPERLY AND FULLY INSTALLED.

CAUTION: BE SURE YOU KEEP THE ACTUATOR ROD FULLY EXTENDED WHEN YOU INSTALL THE BELLCRANK RIG PIN. IF YOU LET THE ACTUATOR ROD RETRACT, THE VARIABLE STATOR

VANES WILL OVERTRAVEL WHICH MAY RESULT IN HARMFUL STABILITY AND/OR DURABILITY EFFECTS.

CAUTION: TOO MUCH TORQUE WITH THE WRENCH ON THE BELLCRANK DURING THIS RIGGING CAN BEND THE BELLCRANK BRACKET. THIS CAN RESULT IN BAD RIGGING.

(1) If not done, make the initial rod end bearing (203/3) adjustment as follows.

(a) Turn the actuator piston rod (203/6) until the flat surface below the rod end bearing (203/3) hex is approximately 9/16 inch (14.288 mm) from the flat surface below the actuator rod threads. See Figure 203 (Sheet 1). This is the approximate initial adjustment only.

(2) Adjust the actuator rod end bearing (203/3) as follows.

(a) Use a standard crowsfoot and wrench on the flats of the bellcrank (203/1) adjacent to the 5th stage adjuster. Pull down on the wrench until you feel the actuator internal stop. Push up on the wrench until you are off of the actuator internal stop. Pull down on the wrench again. Hold the bellcrank (203/1) so that the actuator rod (203/6) is fully extended against the internal stop (vanes open). Hold the actuator fully extended against the internal stop with 300 - 400 lb-in. (33.895 - 45.194 N.m) on the crowsfoot. While you hold the actuator fully extended against the internal stop, install the PWA 86344 Holder between the jamnut and the top of the actuator housing. Tighten and torque the detail bolt to 8 - 10 lb-in. (0.904 - 1.130 N.m). Do not tighten the bolt too much. Tighten the detail jamnut by hand.

(b) Adjust the rod end bearing (203/3) so that you can install the PWA 85395 Rig Pin or the PWA 86097 Rig Pin into the bellcrank arm slot (203/12) and into both holes of the support (203/11).

NOTE: You must remove the PWA 86344 Holder when you adjust the rod end bearing and then install the holder again for the rig pin installation.

(c) Remove the rig pin and PWA 86344 Holder. Lock the rod end bearing to the actuator rod with the jamnut (203/5). Torque the jamnut (203/5) to 460 − 510 lb−in. (51.973 − 57.622 N.m).

(d) Push up on the wrench and retract the actuator rod. Pull down again to fully extend the actuator rod again. Hold the actuator fully extended against the internal stop with 300 − 400 lb−in. (33.895 − 45.194 N.m) on the crowsfoot. While you hold the actuator fully extended against the internal stop, install the PWA 86344 Holder between the jamnut and the top of the actuator housing. Tighten and torque the detail bolt to 8 − 10 lb−in. (0.904 − 1.130 N.m). Do not tighten the bolt too much. Tighten the detail jamnut by hand. Install the rig pin again with the actuator rod fully extended. If you can not install the bellcrank rig pin do the rod end adjustment again in step (2). If you can install the bellcrank rig pin, remove the rig pin and the PWA 86344 Holder. Lock the jamnut (203/5) and the rod end bearing (203/3) with the key washer (203/4). Bend one set of tabs onto the rod end bearing (203/3) and the other set onto the jamnut (203/5). Install the Lockwire P05−289 and seal (203/7). See section 72−53−00,Standard Practices Manual, PN 585005.

(3) Torque the rod end bearing retaining bolt nut (203/10) to a minimum of 15 lb−in. (1.695 N.m) plus the torque necessary to turn the nut on the bolt (203/2). Continue and torque the nut until the slot in the nut aligns with the hole in the bolt. This torque must not be more than 22 lb−in. (2.486 N.m) plus the torque necessary to turn the nut on the bolt. Install the cotter pin (203/9) to the nut. Bend the cotter pin. See section 70−53−00, Standard Practices Manual, PN 585005.

D. Postrequisites

CAUTION: BE SURE YOU REMOVE ALL RIG PINS AND TOOLS FROM THE ENGINE OR ENGINE DAMAGE CAN RESULT.

(1) Test engine per Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

Task 72-00-00-830-003-A:

1. Rig Variable Stator Vane Control System - (Hydraulic Procedure)

A. General

WARNING: DO NOT PUT YOUR FINGERS IN THE WAY OF THE LINKAGES, UNISON RINGS, OR LEVERS WHEN YOU OPERATE THE STATOR VANE SYSTEM.

CAUTION: IT IS VERY IMPORTANT TO DO THIS HYDRAULIC RIGGING PROCEDURE WITH PRECISION. BAD RIGGING CAN CAUSE INCREASED HPC BLADE FATIGUE, INTERNAL ENGINE DAMAGE, OR COMPLETE ENGINE FAILURE.

CAUTION: ALWAYS REMOVE ALL RIG PINS BEFORE YOU MOVE THE STATOR VANE SYSTEM OR DAMAGE CAN RESULT.

NOTE: This hydraulic rigging procedure is the preferred method over the mechanical procedure given in Paragraph 2, Task 72-00-00-830-003-B00. This hydraulic rigging procedure puts a load on the system. This hydraulic load is more equivalent to the load caused during engine operation than the mechanical procedure load.

B. Equipment And Materials Necessary

Standard Tools:

Glenair TG-70	Strap Wrench (Optional to Glenair TG-69)
Glenair TG-69	Soft Jawed Pliers (Optional to Glenair TG-70)
Bergen Mechanical Crimper	(Optional) Model M303, M305 or M307

Special Tools:

PWA 29451 Adapter	
PWA 49030	Hydraulic Cart (Pneumatic) (Optional To CTE 5100)
PWA 85393	Rig Pin (3 Required)
PWA 85394	Rig Pin (Optional to PWA 86197)
PWA 85395	Rig Pin (Pre SB PW4ENG 72-246)
PWA 86097	Rig Pin (Post SB PW4ENG 72-246)
PWA 86197	Rig Pin
PWA 86317	Electrical Switch Box (Preferred)
PWA 101618	Adapter Elbow 90° (Optional)

Special Tools:

(CONTINUED)

CTE 5100	Hydraulic Cart (Pneumatic) Optional To PWA 49030)

NOTE: NOTE: The PWA 85675 Rigging Pin Kit contains the above rig pins.

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P03-003	Fluid, Calibrating
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
	P05-292	Ferrule, Safety Cable (Optional)
R	P06-054	Paste, Anti-Seize (PWA 36246)
	P11-009	Alcohol, Denatured Ethyl (AMS 3002)

Expendable Parts:

Seal	2	72-35-00/27/190
Seal	2	72-35-00/28/170

C. Procedure
See Figure 201 and Figure 202.

WARNING: DO NOT LET ENGINE FUEL STAY ON YOUR SKIN FOR A LONG TIME. THE FUEL IS POISONOUS AND CAN GO THROUGH YOUR SKIN. PUT A CONTAINER, MINIMUM CAPACITY OF 5 U.S. GALLONS (19 liters), IN POSITION AND COLLECT THE DRAINED FUEL.

(1) Remove the lockwire and disconnect the compressor stator hydraulic pressure tube (CP12) at both ends. Remove the lockwire and disconnect the compressor stator hydraulic return tube (CR03) at both ends. Loosen both clamp bolts and position the tubes away from the actuator adapters. Install the protection covers.

(2) Install the PWA 49030 Hydraulic Cart or CTE 5100 Hydraulic Cart as follows.

NOTE: If you do not know which pump to use, refer to Engine General − Special Procedures−23, Task 72−00−00−910−001 for Hydraulic Pump Service And Operation of the PWA 49030 Hydraulic Pump or the CTE 5100 Hydraulic Pump.

(a) Install the PWA 29451 Adapter to the actuators pressure adapter (Port PF). See Figure 201 (Sheet 1).

(b) Tighten and torque the PWA 29451 Adapter to 225 − 250 lb−in. (25.422 − 28.246 N.m).

NOTE: Hold the actuator adapter while you torque the tool adapter.

(c) Install the hydraulic pressure hose to the PWA 29451 Adapter.

NOTE: If necessary, use a standard 45 degree or 90 degree PWA 101618 Adapter on the end of hydraulic pressure hose.

(d) Install the hydraulic return hose to the actuators return adapter (Port PFR).

(e) Hold the adapters with a wrench and torque the nuts on pressure hose and return hose to 200 − 225 lb−in. (22.597 − 25.422 N.m).

(3) With the power OFF, install the PWA 86317 Electrical Switch Box as follows.

NOTE: Although the PWA 86317 Electrical Switch Box is preferred, if the electrical switch box is not available, you can do a check of the stator vane rigging system without the box. Go to step (4).

(a) Disconnect the W4P3 and the W5P7 harness connectors from the stator vane actuator electrical Receptacles J7 and J3. Install protection covers to the connectors.

(b) Install the electrical lead from the electrical switch box to the upper receptacle on the stator vane actuator Marked J7.

(4) Service the hydraulic pump with Calibrating Fluid P03-003.

NOTE: If you do not know how to service the hydraulic pump, refer to Engine General - Special Procedures-23, Task 72-00-00-910-001 for Hydraulic Pump Service of the PWA 49030 Hydraulic Pump or the CTE 5100 Hydraulic Pump.

WARNING: MAKE SURE ALL PERSONS AND TOOLS ARE AWAY FROM THE MECHANICAL PARTS OF THE STATOR VANE ACTUATOR. WHEN YOU START THE PUMP, THE ACTUATOR CAN MOVE. IF YOU DO NOT DO THIS, YOU CAN CAUSE INJURY OR DAMAGE THE ENGINE.

(5) Operate the PWA 49030 Hydraulic Pump or the CTE 5100 Hydraulic Pump to fully extend the actuator rod (vanes open).

NOTE: If you do not know how to operate the hydraulic pump, refer to Engine General - Special Procedures-23, Task 72-00-00-910-001 for operation instructions of the PWA 49030 Hydraulic Pump or the CTE 5100 Hydraulic Pump.

(a) If a pneumatic driven hydraulic pump is used, supply 25 - 30 psig (172.4 - 206.8 kPa) air pressure to the pumps air gage.

(b) Supply 250 - 300 psig (1723.7 - 2068.4 kPa) hydraulic pressure to the stator vane actuator (Port PF).

(6) Examine the stator vane control system rigging as follows.

NOTE: If an electrical switch box is not available, go to step (7).

(a) Push the power switch (201/3) on the electrical switch box to on position.

(b) Push the actuation switch (201/2) on the electrical switch box to the extend and retract positions several times to operate the actuator. Stop the rod (201/1) in the extended position. Go to step (8).

(7) If the PWA 86317 Electrical Switch Box is not available, operate the stator vane system as follows.

(a) If an air supply is used, turn the air supply valve knob to the closed position (perpendicular to flow). Hydraulic pressure will bleed off.

(b) Use a standard crowsfoot and wrench on the flats of the bellcrank (202/4) adjacent to the 5th stage adjuster. See Figure 202. Push up on the wrench and move the bellcrank (202/4) to the closed position. Remove the crowsfoot and wrench.

(c) Operate the hydraulic cart and supply 250 - 300 psig (1723.7 - 2068.4 kPa) hydraulic pressure to the Actuator PF port. The stator vane actuator will move to the full open position. The stator vane actuator piston is now extended against the internal stop. Do step (7) again (one more time).

CAUTION: BE SURE AND USE THE CORRECT BELLCRANK RIG PIN. USE THE LARGER PWA 85395 RIG PIN FOR (PRE SB PW4ENG 72-246 ENGINES). USE THE SMALLER PWA 86097 RIG PIN FOR (POST SB PW4ENG 72-246 ENGINES).

CAUTION: BE SURE THAT THE END OF THE RIG PINS ARE PROPERLY AND FULLY INSTALLED.

(8) With the actuator rod fully extended, (vanes open) put the bellcrank PWA 85395 Rig Pin or bellcrank PWA 86097 Rig Pin into the rig pin slot of the bellcrank arm (202/3) and into both holes of the support (202/2).

(9) If you can put the bellcrank rig pin in, go to step (12) and do a check of the unison rings rigging.

(10) If you can not put the bellcrank rig pin in, go to step (11) and adjust the actuator rod end.

CAUTION: RIG PINS MUST ALWAYS BE REMOVED PRIOR TO RELEASING ACTUATOR PRESSURE OR DAMAGE TO SYSTEM CAN RESULT.

(11) If necessary, adjust the actuator rod end bearing (202/6) as follows.

(a) If an air supply is used, turn the air supply valve knob of the hydraulic cart to the closed position (perpendicular to flow).

(b) Remove and discard the cotter pin (202/12) from the stator vane actuator rod end bearing retaining bolt (202/5). Loosen and remove the nut (202/13), washer (202/11) and bolt (202/5) from the stator vane actuator rod end bearing.

(c) Remove the lockwire and seal (202/10) from the actuator rod and make the tabs of key washer (202/7) straight. Loosen the jamnut (202/8) and remove the rod end bearing (202/6) Remove the key washer (202/7). Install the new key washer and install the rod end bearing (202/6), threads lubricated with Engine Oil P03-001. Tighten until the flat surface below the hex is approximately 9/16 inch (14.288 mm) from the flat surface below the actuator rod threads. See Figure 202 (Sheet 2). This is the approximate initial adjustment only.

(d) Align and temporarily connect the rod end bearing (202/6) to the bellcrank (202/4) with the bolt (202/5).

NOTE: Make sure the bolt head stays against the surface of the bellcrank. Do not let the bolt move out of the bolthole at all.

(e) Operate the hydraulic cart and supply 250 - 300 psig (1723.7 - 2068.4 kPa) hydraulic pressure to the Actuator (Port PF). Fully extend the actuator rod (202/9) to the full open position.

CAUTION: BE SURE THE ACTUATOR ROD STAYS FULLY EXTENDED WHEN YOU INSTALL THE BELLCRANK RIG PIN. IF THE ACTUATOR ROD IS ALLOWED TO RETRACT, THE VARIABLE STATOR VANES WILL OVERTRAVEL WHICH MAY RESULT IN

HARMFUL STABILITY AND/OR DURABILITY EFFECTS.

(f) Adjust the rod end bearing (202/6) so you can put the bellcrank PWA 85395 Rig Pin or PWA 86097 Rig Pin into the rig pin slot of the bellcrank arm (202/3) and into both holes of the support (202/2) with the hydraulic pressure on. Install the washer (202/11) and nut (202/13), threads lubricated with Engine Oil P03-001, to the bolt (202/5). Torque the nut to a minimum of 15 lb-in. (1.695 N.m) plus the torque necessary to turn the nut on the bolt. Continue to torque the nut until the slot in the nut aligns with the hole in the bolt. This torque must not be more than 22 lb-in. (2.486 N.m) plus the torque necessary to turn the nut on the bolt. Install the cotter pin (202/12) to the nut. Bend the cotter pin. See section 70-53-00 in the Standard Practices Manual, PN 585005.

NOTE: If an air supply is used, turn the air supply valve knob of the hydraulic cart to the closed position and temporarily reduce the hydraulic pressure to 0 psig (0.0 kPa). You can turn the actuator piston rod for the last small adjustment.

(g) Lock the rod end bearing to the actuator rod with the jamnut (202/8). Torque the jamnut (202/8) to 460 - 510 lb-in. (51.973 - 57.622 N.m).

CAUTION: REMOVE ALL THE RIG PINS FROM THE UNISON RINGS AND THE BELLCRANK BEFORE YOU CONTINUE OR DAMAGE CAN RESULT.

(h) Remove the bellcrank rig pin. Push the actuation switch (201/2) on the electrical switch box to retract and extend the actuator several times through full travel. Stop with the rod fully extended. Go to step (j).

NOTE: If an electrical switch box is not available continue with step (i).

(i) If the PWA 86317 Electrical Switch Box is not available, operate the stator vane system as follows.

1 If an air supply is used, turn the air supply valve knob of the hydraulic cart to the closed position (perpendicular to flow).

2 Use a crowsfoot and wrench on the flats of the bellcrank (202/4). Push the wrench up and move the system to the closed position. Remove the wrench.

3 Operate the hydraulic cart and supply 250 − 300 psig (1723.7 − 2068.4 kPa) hydraulic pressure to the Actuator (Port PF). Fully extend the actuator rod (202/9) to the full open position. The stator vane actuator piston is now extended against the internal stop. Do step (i) again one more time.

(j) With the actuator rod (202/9) extended fully (vanes open), install the bellcrank rig pin in the rig pin slot (202/3) of the bellcrank arm and both holes of the support (202/2). If you can not install the rig pin, do the rod end adjustment again in step (10). If you can install the rig pin, lock the jamnut (202/8) and rod end (202/6) with the key washer (202/7). Bend one set of tabs onto the rod end bearing (202/6) and the other set onto the jamnut (202/8). Install the Lockwire P05−289 and seal (202/10). See section 70−53−00 of the Standard Practices Manual, PN 585005.

CAUTION: REMOVE ALL THE RIG PINS FROM THE UNISON RINGS AND THE BELLCRANK BEFORE YOU CONTINUE OR DAMAGE CAN RESULT.

(12) Remove the bellcrank rig pin. Operate the hydraulic cart and supply 250 − 300 psig (1723.7 − 2068.4 kPa) hydraulic pressure to the Actuator PF port. Fully extend the actuator rod (202/9) to the full open position. Install the bellcrank PWA 85395 Rig Pin or PWA 86097 Rig Pin. Install three PWA 85393 Rig Pins into the IGV, 5th, and 6th stage unison ring rig pin holes. Install the PWA 85394 Rig Pin or the PWA 86197 Rig Pin into the 7th stage unison ring rig pin hole.

(13) If you can put all the rig pins in, then remove all the rig pins from the unison rings and the bellcrank. Go to step (15).

(14) If you can not put any one of the unison ring rig pins in, remove the unison ring rig pins and bellcrank rig pins. Move the hydraulic cart flow control valve handle to the neutral position. If an air supply is used, turn the air supply valve knob to the neutral position. Turn the air supply valve handle to the closed position (perpendicular to flow). Disconnect the unison ring linkage. Disassemble and reassemble with new key washers (202/21), then adjust as follows.

(a) Install the bellcrank PWA 85395 Rig Pin or PWA 86097 Rig Pin. Turn the adjusters (202/19) so that you can install all the unison ring rig pins.

(b) Torque the nuts (202/16) at each changed rod end to 15 − 22 lb−in. (1.695 − 2.486 N.m) plus the torque necessary to turn the nut on the bolt (202/14). Install the cotter pins (202/15). See section 70−53−00, Standard Practices Manual, PN 585005.

(c) Examine the adjusters (202/19) and rod ends for proper installation. Install a piece of wire into the inspection holes (202/20) at both ends of each adjuster. If you can not put the wire through, the installation is satisfactory. If you can put the wire through at either end, you must disassemble the linkage and adjust it as necessary so that the wire will not pass through.

(d) With the rod ends properly installed, torque the jamnuts (202/17) at each rod end to 115 − 150 lb−in. (12.993 − 16.948 N.m).

CAUTION: REMOVE ALL THE RIG PINS FROM THE UNISON RINGS AND THE BELLCRANK BEFORE YOU CONTINUE OR DAMAGE CAN RESULT.

(e) With all the rig pins removed, operate the hydraulic cart and supply 250 − 300 psig (1723.7 − 2068.4 kPa) hydraulic pressure to the Actuator (Port PF). Push the actuation switch (201/2) to retract and extend the actuator several times through full travel. Stop with the rod fully extended. Go to step (g).

(f) If an electrical switch box is not used, use a standard crowsfoot and wrench on the flats of the bellcrank adjacent to the 5th stage adjuster. Push up on the wrench and move the bellcrank (202/4) to the closed position. Remove the crowsfoot and wrench. Operate the hydraulic cart and supply 250 - 300 psig (1723.7 - 2068.4 kPa) hydraulic pressure to the Actuator (Port PF). Extend the actuator to the full open position. Do this again (one more time).

(g) Install the bellcrank PWA 85395 Rig Pin or PWA 86097 Rig Pin. Install the four unison ring rig pins. If you can not install any one of the rig pins, do step (14) again. Remove all the rig pins.

(h) Bend one set of key washer (202/21) tabs onto the adjuster (202/19) flats and the other set onto the jamnuts (202/17). Install the Lockwire P05-289 and seals (202/18) to the rod ends. See section 70-53-00 in the Standard Practices Manual, PN 585005.

(15) After the adjustment, disconnect the pumps hydraulic pressure hose and return hose from the actuator. Refer to Engine General - Special Procedures-23, Task 72-00-00-910-001 for operation instructions of the PWA 49030 Hydraulic Pump or the CTE 5100 Hydraulic Pump.

(16) Remove the PWA 29451 Adapter from the (Port PF).

NOTE: Hold the adapters while you disconnect the hoses and tool adapter.

(17) Push the power switch (201/3) on the electrical switch box to off. Disconnect the electrical connector from the actuator.

(18) Connect the W4P3 and the W5P7 harness connectors to the actuator harness receptacles as follows. For each connector:

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11-009. Let the connector and receptacle dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG-70 Strap Wrench or the Glenair TG-69 Soft-jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(19) Install the compressor stator cylinder hydraulic pressure tube assembly (CP12).

R (a) Remove the protective covers. Lubricate the tube
R adapter threads at each end with Anti-Seize Paste
R P06-054. Remove the unwanted paste.

(b) Install the tube nuts to the larger adapter on the actuator and to the hydraulic manifold tee handtight only.

(c) Torque the clamp bolt, lubricated with Engine Oil P03-001, to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(d) Torque the tube nuts to 225 - 250 lb-in. (25.422 - 28.246 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(20) Install the compressor stator cylinder hydraulic return tube assembly (CR03).

R (a) Remove the protective covers. Lubricate the tube
R adapter threads at each end with Anti-Seize Paste
R P06-054. Remove the unwanted paste.

(b) Install the tube nuts to the smaller adapter on the actuator and to the inlet return manifold tee handtight only.

(c) Torque the clamp bolt, lubricated with Engine Oil P03-001, to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(d) Torque the tube nuts to 225 - 250 lb-in. (25.422 - 28.246 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

D. Postrequisites

CAUTION: BE SURE YOU REMOVE ALL RIG PINS AND TOOLS FROM THE ENGINE OR ENGINE DAMAGE CAN RESULT.

(1) Test engine per Test Reference Table. See 71-00-00, Testing-00 Task 71-00-00-990-003.

Task 72-00-00-830-003-B:

2. Rig Variable Stator Vane Control System - (Mechanical Procedure)

A. General

WARNING: DO NOT PUT YOUR FINGERS IN THE WAY OF THE LINKAGES, UNISON RINGS, OR LEVERS WHEN YOU OPERATE THE STATOR VANE SYSTEM.

CAUTION: IT IS VERY IMPORTANT TO DO THIS MECHANICAL RIGGING PROCEDURE WITH PRECISION. BAD RIGGING CAN CAUSE INCREASED HPC BLADE FATIGUE, INTERNAL ENGINE DAMAGE, OR COMPLETE ENGINE FAILURE.

CAUTION: ALWAYS REMOVE ALL RIG PINS BEFORE YOU MOVE THE STATOR VANE SYSTEM.

NOTE: Also see the preferred hydraulic procedure in Paragraph 1, Task 72-00-00-830-003-A00.

B. Equipment And Materials Necessary

Special Tools:

PWA 85393	Rig Pin (3 Required)
PWA 85394	Rig Pin (Optional to PWA 86197)
PWA 85395	Rig Pin (Pre SB PW4ENG 72-246)
PWA 86097	Rig Pin (Post SB PW4ENG 72-246)
PWA 86197	Rig Pin
PWA 86344	Holder, Rigging

NOTE: The PWA 85675 Rigging Pin Kit contains the above rig pins.

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Cotter Pin	2	72-35-00/25/160

C. Procedure
See Figure 203 and Figure 204.

CAUTION: BE SURE AND USE THE CORRECT BELLCRANK RIG PIN. USE THE LARGER PWA 85395 RIG PIN FOR (PRE SB PW4ENG 72-246 ENGINES). USE THE SMALLER PWA 86097 RIG PIN FOR (POST SB PW4ENG 72-246 ENGINES).

CAUTION: BE SURE THAT THE END OF THE RIG PINS ARE PROPERLY AND FULLY INSTALLED.

CAUTION: BE SURE YOU KEEP THE ACTUATOR ROD FULLY EXTENDED WHEN YOU INSTALL THE BELLCRANK RIG PIN. IF YOU LET THE ACTUATOR ROD RETRACT, THE VARIABLE STATOR VANES WILL OVERTRAVEL WHICH MAY RESULT IN HARMFUL STABILITY AND/OR DURABILITY EFFECTS.

CAUTION: TOO MUCH TORQUE WITH THE WRENCH ON THE BELLCRANK DURING THIS RIGGING CAN BEND THE BELLCRANK BRACKET. THIS CAN RESULT IN BAD RIGGING.

(1) Use a standard crowsfoot and wrench on the flats of the bellcrank (203/3) adjacent to the 5th stage adjuster. Pull down on the wrench until you feel the actuator internal stop. Push up on the wrench until you are off of the actuator internal stop. Pull down on the wrench again. Hold the bellcrank (203/3) so that the actuator rod (204/8) is fully extended against the internal stop (vanes open). Hold the actuator fully extended against

the internal stop with 300 − 400 lb−in. (33.895 − 45.194 N.m) on the crowsfoot. While you hold the actuator fully extended against the internal stop, install the PWA 86344 Holder between the jamnut and the top of the actuator housing. Tighten and torque the detail bolt to 8 − 10 lb−in. (0.904 − 1.130 N.m). Do not tighten the bolt too much. Tighten the detail jamnut by hand. Install the bellcrank PWA 85395 Rig Pin or the bellcrank PWA 86097 Rig Pin into the bellcrank arm slot (203/2) and into both holes of the support (203/1).

(2) If you can install the bellcrank rig pin, remove the rig pin. Remove the PWA 86344 Holder. Push up on the wrench and retract the actuator rod. Pull down again to fully extend the actuator rod again. Hold the actuator fully extended against the internal stop with 300 − 400 lb−in. (33.895 − 45.194 N.m) on the crowsfoot. While you hold the actuator fully extended against the internal stop, install the PWA 86344 Holder between the jamnut and the top of the actuator housing. Tighten and torque the detail bolt to 8 − 10 lb−in. (0.904 − 1.130 N.m). Do not tighten the bolt too much. Tighten the detail jamnut by hand. Install the bellcrank rig pin again with the actuator rod fully extended. Go to step (5).

(3) If you can not install the bellcrank rig pin, go to step (4) and adjust the actuator rod end bearing (204/5).

(4) If necessary, adjust the actuator rod end bearing (204/5) as follows.

  (a) Remove the PWA 86344 Holder. Remove and discard the cotter pin (204/12) from the stator vane actuator rod end bearing retaining bolt (204/4). Loosen and remove the nut (204/11), washer (204/10) and bolt (204/4) from the stator vane actuator rod end bearing.

  (b) Remove the lockwire and seal (204/9) from the actuator rod and make the tabs of key washer (204/6) straight. Loosen the jamnut (204/7) and remove the rod end bearing (204/5). Remove the key washer (204/6). Install the new key washer and install the rod end bearing (204/5), threads lubricated with Engine Oil P03−001. Tighten until the flat surface below the hex is approximately

9/16 inch (14.288 mm) from the flat surface below the actuator rod threads. See Figure 204 (Sheet 1). This is the approximate initial adjustment only.

(c) Align and temporarily connect the rod end bearing (204/5) to the bellcrank (204/3) with the bolt (204/4).

NOTE: Make sure the bolt head stays against the surface of the bellcrank. Do not let the bolt move out of the bolthole at all.

CAUTION: BE SURE AND USE THE CORRECT BELLCRANK RIG PIN. USE THE LARGER PWA 85395 RIG PIN FOR (PRE SB PW4ENG 72-246 ENGINES). USE THE SMALLER PWA 86097 RIG PIN FOR (POST SB PW4ENG 72-246 ENGINES).

CAUTION: BE SURE THAT THE END OF THE RIG PINS ARE PROPERLY AND FULLY INSTALLED.

CAUTION: BE SURE YOU KEEP THE ACTUATOR ROD FULLY EXTENDED WHEN YOU INSTALL THE BELLCRANK RIG PIN. IF YOU LET THE ACTUATOR ROD RETRACT, THE VARIABLE STATOR VANES WILL OVERTRAVEL WHICH MAY RESULT IN HARMFUL STABILITY AND/OR DURABILITY EFFECTS.

CAUTION: TOO MUCH TORQUE WITH THE WRENCH ON THE BELLCRANK DURING THIS RIGGING CAN BEND THE BELLCRANK BRACKET. THIS CAN RESULT IN BAD RIGGING.

(d) Pull down on the wrench and hold the bellcrank (204/3) so that the actuator rod (204/8) is fully extended against the internal stop (vanes open). Hold the actuator fully extended against the internal stop with 300 - 400 lb-in. (33.895 - 45.194 N.m) on the crowsfoot. While you hold the actuator fully against the internal stop, install the PWA 86344 Holder between the jamnut and the top of the actuator housing. Tighten and torque the detail bolt to 8 - 10 lb-in. (0.904 - 1.130 N.m). Do not tighten the bolt too much. Tighten the detail jamnut by hand. Install the bellcrank rig pin into the bellcrank arm slots (204/2) and into both holes of the support (204/1).

(e) If you can install the bellcrank rig pin, remove the rig pin. Remove the PWA 85344 Holder. Push up on the wrench and retract the actuator rod. Pull down again to fully extend the actuator rod again. Hold the actuator fully extended against the internal stop with 300 − 400 lb−in. (33.895 − 45.194 N.m) on the crowsfoot. While you hold the actuator fully extended against the internal stop, install the PWA 86344 Holder between the jamnut and the top of the actuator housing. Tighten and torque the detail bolt to 8 − 10 lb−in. (0.904 − 1.130 N.m). Do not tighten the bolt too much. Tighten the detail jamnut by hand. Install the rig pin again with the actuator rod fully extended. Go to step (g).

(f) If you can not install the bellcrank rig pin, remove the PWA 86344 Holder. Adjust the rod end bearing (204/5) so that you can install the bellcrank rig pin with the actuator rod (204/8) fully extended and the PWA 86344 Holder installed. Install the bellcrank rig pin.

NOTE: Remove the bolt (204/4) and turn the rod end bearing (204/5) for larger adjustment if necessary. Use the flats and turn the actuator rod (204/8) for smaller adjustment. You must remove and install again the PWA 86344 Holder when you adjust the rod end bearing.

(g) Install the washer (204/10) and nut (204/11), threads lubricated with Engine Oil P03−001, to the bolt (204/4). Torque the nut to a minimum of 15 lb−in. (1.695 N.m) plus the torque necessary to turn the nut on the bolt. Continue and torque the nut until the slot in the nut aligns with the hole in the bolt. This torque must not be more than 22 lb−in. (2.486 N.m) plus the torque necessary to turn the nut on the bolt. Install the cotter pin (204/12) to the nut. Bend the cotter pin. See the 70−00−00, Standard Practices Section. Lock the rod end bearing to the actuator rod with the jamnut (204/7). Torque the jamnut (204/7) to 460 − 510 lb−in. (51.973 − 57.622 N.m). With the rig pin removed, push down on the wrench. Hold the actuator fully extended against the internal stop with 300 − 400 lb−in. (33.895 − 45.194 N.m) on the crowsfoot. While you hold the actuator fully extended against the internal stop, install the PWA 86344 Holder between the jamnut and the top of the actuator housing. Tighten and torque the detail bolt to 8 - 10 lb-in. (0.904 - 1.130 N.m). Do not tighten the bolt too much. Tighten the detail jamnut by hand. Install the bellcrank rig pin again with the actuator rod fully extended. Lock the jamnut (204/7) and rod end (204/5) with the key washer (204/6). Bend one set of tabs onto the rod end bearing (204/5) and the other set onto the jamnut (204/7). Install the Lockwire P05-289 and seal (204/9). See section 70-53-00 in the Standard Practices Manual, PN 585005.

(5) With the actuator rod (204/8) fully extended and the bellcrank rig pin fully installed, install three PWA 85393 Rig Pins into the IGV, 5th, and 6th stage unison ring rig pin holes. Install the PWA 85394 Rig Pin or PWA 86197 Rig Pin into the 7th stage unison ring rig pin hole.

(6) If you can put all the rig pins in, then remove all the rig pins from the unison rings and the bellcrank. Remove the PWA 86344 Holder. The system is properly adjusted.

(7) If you can not put any one of the unison ring rig pins in, remove all the rig pins and the PWA 86344 Holder. Disconnect the unison ring linkage. Disassemble and reassemble with new key washers (204/20), then adjust as follows.

(a) While you hold the actuator fully extended against the internal stop, install the PWA 86344 Holder between the jamnut and the top of the actuator housing. Tighten and torque the detail bolt to 8 - 10 lb-in. (0.904 - 1.130 N.m). Do not tighten the bolt too much. Tighten the detail jamnut by hand. Install the bellcrank PWA 85395 Rig Pin or PWA 86097. Turn the adjusters (204/18) so that you can install all the unison ring rig pins.

(b) Torque the nuts (204/15) at each changed rod end to 15 - 22 lb-in. (1.695 - 2.486 N.m) plus the torque necessary to turn the nut on the bolt (204/13). Install the cotter pins (204/14). See section 70-53-00 in the Standard Practices Manual, PN 585005.

(c) Examine the adjusters (204/18) and rod ends for proper installation. Install a piece of wire into the inspection holes (204/19) at both ends of each adjuster. If you can not put the wire through, the installation is satisfactory. If you can put the wire through at either end, you must disassemble the linkage and adjust it as necessary so that the wire will not pass through.

(d) With the rod ends properly installed, torque the jamnuts (204/16) at each rod end to 115 - 150 lb-in. (12.993 - 16.948 N.m).

(e) With the bellcrank rig pin installed, install all the unison ring rig pins. If you can not install any one of the unison ring rig pins do step (7) again. If you can install all the unison ring rig pins, then remove all the rig pins from the unison rings and the bellcrank. Remove the PWA 86344 Holder. The system is properly adjusted.

(f) Bend one set of key washer (204/20) tabs onto the adjuster (204/18) flats and the other set onto the jamnuts (204/16). Install the Lockwire P05-289 and seals (204/17) to the rod ends. See section 70-53-00 in the Standard Practices Manual, PN 585005.

D. Postrequisites

CAUTION: BE SURE YOU REMOVE ALL RIG PINS AND TOOLS FROM THE ENGINE OR ENGINE DAMAGE CAN RESULT.

(1) Test engine per Test Reference Table. See 71-00-00, Testing-00 Task 71-00-00-990-003.

ENGINE GENERAL - SPECIAL PROCEDURES-06

Task 72-00-00-830-004:

1. Rig The Turbine Case Cooling (TCC) Control System-Check And Partial Rig With Undersize Rigging Pins

NOTE: Use this rigging procedure:
- After the replacement of the (TCC) HPT air shutoff valve and/or
- After the replacement of the (TCC) LPT air shutoff valve and/or
- After the replacement of the (TCC) air valve actuator
- For a check of the entire turbine case cooling control system.

NOTE: Use the complete rigging procedure in Special/ Procedures-11 only:
- If the turbine case cooling control system can not be rigged per this procedure
- After the assembly of the entire turbine case cooling control system during the engine build-up
- After the replacement of the (TCC) air valve control cable.

A. Equipment And Materials Required

Special Tools:

PWA 85465	Rigging Pin
PWA 86069	Rigging Pin - Undersize (2 Required)

NOTE: Above rigging pin can be contained within the Rigging Pin Kit (PWA 85675).

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)

B. Procedure
See Figure 201.

CAUTION: IF YOU USE A LONGER POSITIONING BOLT OTHER THAN THE SPECIFIED BOLT LENGTH AND YOU TURN THE BOLT UNTIL IT TOUCHES BOTTOM (SEATED), YOU CAN DAMAGE THE ACTUATOR.

(1) Install a positioning bolt into the threaded positioning hole on the rear of the actuator (201/1). Turn the bolt in and align the piston shaft rig hole with the rigging hole in the actuator housing. Install

a PWA 85465 Rigging Pin in the rigging hole. Feel the rigging pin installation to be sure that the pin is fully engaged into the piston shaft rigging hole.

NOTE: The positioning bolt is a quality standard hexhead bolt with a 8−32 by 1.5 inch (38.1 mm) thread length. With a 1.5 inch (38.1 mm) length bolt and when the rig pin touches bottom (fully seated), approximately 0.125 inch (3.175 mm) of the bolt threads are showing.

(2) Hold the HPT valve lever arm (201/3) against the idler arm (201/2) during the entire rigging check. Allow no gap between the arms. Install a PWA 86069 Undersize Rigging Pin through the HPT valve lever arm (201/3) and into the housing rigging hole. If you can not install the pin into the valve housing rigging hole, rig the complete system per Special Procedures−11. If you can install the pin into the valve housing rigging hole, keep the pin installed and continue as follows.

(3) Install one more PWA 86069 Undersize Rigging Pin through the LPT valve lever arm (201/8) and into the valve housing rigging hole. If you can install the pin into the valve rigging hole, the rigging of the system is satisfactory. If the system is satisfactory, remove the tools per step (7). If you cannot install the pin into the valve housing rigging hole, continue as follows.

(4) Remove the bolt (201/9) and nut (201/7) that attach the adjuster rod end (201/4) to the LPT valve lever arm (201/8). Align the LPT valve lever arm (201/8) with the rigging pin hole in the valve housing. Install the PWA 86069 Rigging Pin .

(5) Remove the lockwire and loosen the two adjuster jamnuts (201/5). Turn the adjuster (201/6) and align the rod end (201/4) with the bolthole in the LPT valve lever arm (201/8). Be sure rod end threads are seen through both sight holes in the adjuster. Install the bolt (201/9), lubricated with Engine Oil P03−001, and nut (201/7) that attach the rod end (201/4) to the arm (201/8). Torque the nut to 36 − 40 lb−in. (4.067 − 4.519 N.m).

NOTE: The bolt (201/9) must be installed from the inside of the LPT lever arm (201/8).

(6) Tighten and torque the jamnuts (201/5) to 14 − 16 lb−in. (1.582 − 1.808 N.m). Install the Lockwire P05−289.

(7) Remove all three rigging pins. After the removal of the rigging pins, remove the positioning bolt from the rear of the actuator (201/1).

C. Postrequisites

CAUTION: BE SURE THE THREE RIGGING PINS AND THE POSITIONING BOLT ARE REMOVED FROM THE ENGINE OR DAMAGE CAN RESULT.

(1) Test the engine per the Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

Task 72-00-00-020-001:

1. Trunnion Intermediate Case Through HPT From Horizontal To Front End Down Position

A. Equipment And Materials Required

Special Tools:
PWA 28657 Sling
PWA 76156 Adapter (2 Necessary)
PWA 85064 Fixture, Handling
PWA 85243 Plug, Support
PWA 85344 Ring, Adapter
PWA 85623 Eye, Lifting
PWA 85678 Stand, Support (3 Necessary) (Optional to PWA 87166/PWA 101960)
PWA 86617 Retainer, Rotor
PWA 87166 Stand, Support (3 Necessary)
PWA 101960 Adapter, Support (3 Necessary)

B. Procedure

See Figure 201.

NOTE: If there is a bolt in one of the holes of the 12 o'clock ground handling pad that you cannot remove, you must repair the intermediate case. Refer to 72-00-34, Repair-01 (Task 72-00-34-300-001).

(1) Install the PWA 85623 Eye to the ground handling boss at the 12 o'clock location on outer intermediate case. Attach the eye to the case with bolts. Torque the bolts to 675 - 750 lb-in. (76.265 - 84.739 N.m).

(2) Install the PWA 85344 Ring onto the rear flange of the HPT case and attach in place.

(3) Using PWA 28657 Sling with two PWA 76156 Adapters attached to trunnion spools of PWA 85064 Fixture, position fixture onto Ring (PWA 85344). Aligning dowel pin hole with dowel pin in ring, secure fixture to case with bolts.

(4) Loosen knobs in center hub and install PWA 85243 Plug into center hub against 2nd stage hub. Secure plug in position using fixture knobs.

(5) Install the PWA 86617 Retainer into the hub of the fixture and into the inner diameter of the HPC rear hub. Attach the retainer to the center hub of the fixture.

(6) With hoist and sling attached to fixture attach second hoist to eye on intermediate case and raise engine from pedestals and saddle. Trunnion engine to front end down.

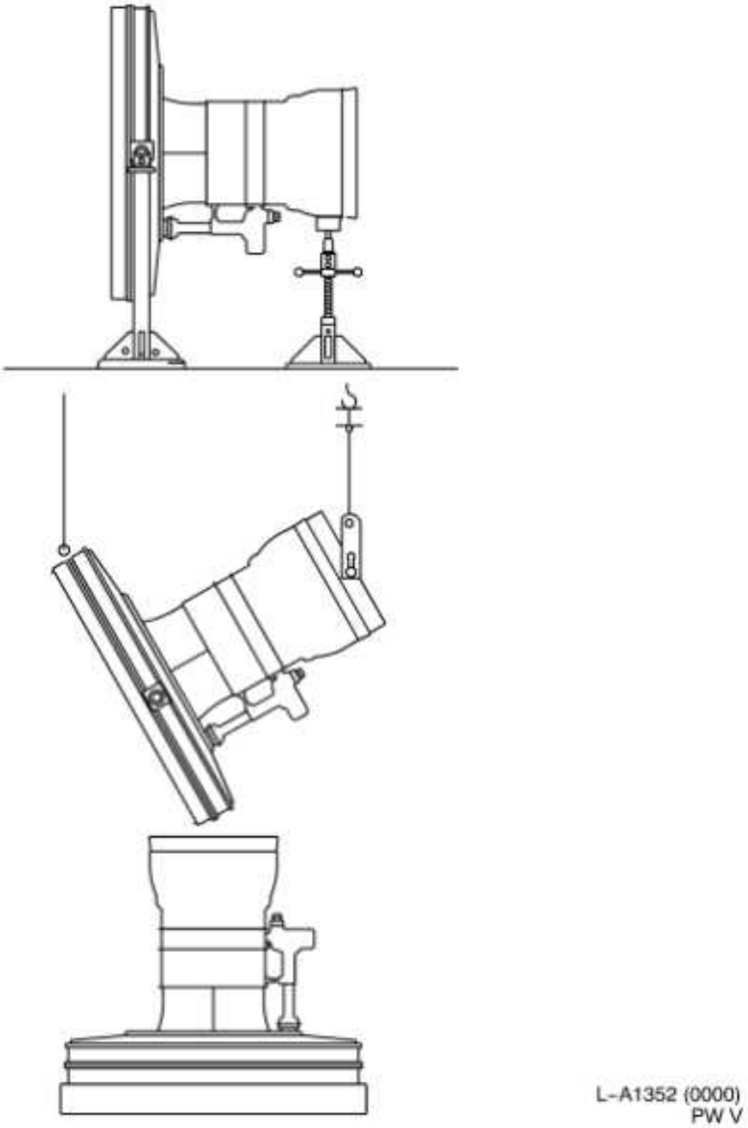
CAUTION: BE SURE PINS ARE PROPERLY SECURED IN PLACE.

(7) Position three PWA 87166 Stands or three PWA 87166 Stands with PWA 101960 Adapters approximately 120 degrees apart. Lower engine to rest on stands. Secure case to stands with detail bolts and nuts.

NOTE: Stands are adjustable for height. Be sure all stands are locked for equal height.

(8) Remove hoist, eye and brackets from intermediate case.

(9) Remove retainer and plug from fixture. Using hoist, with sling and adapters attached, remove fixture from case and ring. Remove ring from case.



Trunnion Intermediate Case Through
HPT To Front End Down

ENGINE GENERAL - SPECIAL PROCEDURES-08

Task 72-00-00-420-001:

1. Trunnion Intermediate Case Through HPT From Front End Down To Horizontal Position

A. Equipment And Materials Required

Special Tools:
PWA 25757 Pedestal (2 Necessary)
PWA 25926 Adapters (2 Necessary)
PWA 26157 Pedestal (Optional to PWA 87359)
PWA 28657 Sling
PWA 76156 Adapter (2 Necessary)
PWA 85062 Saddle
PWA 85064 Fixture, Handling
PWA 85243 Plug, Support
PWA 85344 Ring, Adapter
PWA 85623 Eye, Lifting
PWA 85662 Bracket (2 Necessary)
PWA 86617 Retainer, Rotor
PWA 87359 Pedestal

B. Procedure

See Figure 201.

NOTE: If there is a bolt in one of the holes of the 12 o'clock ground handling pad that you cannot remove, you must repair the intermediate case. Refer to 72-00-34, Repair-01 (Task 72-00-34-300-001).

(1) Install two PWA 85662 Bracket to ground handling bosses at 3 and 9 o'clock locations on intermediate case. Secure brackets with four bolts and torque bolts to 675 - 750 lb-in. (76.265 - 84.739 N.m).

(2) Install the PWA 85623 Eye to the ground handling boss at the 12 o'clock location on the outer intermediate case. Attach the eye to the case with bolts. Torque the bolts to 675 - 750 lb-in. (76.265 - 84.739 N.m).

(3) Install PWA 85344 Ring onto rear flange of HPT case and secure in place.

(4) Using PWA 28657 Sling with two PWA 76156 Adapters attached to trunnion spools of PWA 85064 Fixture, position fixture on Ring (PWA 85344). Aligning dowel pin hole with dowel pin in ring, secure fixture to case with bolts.

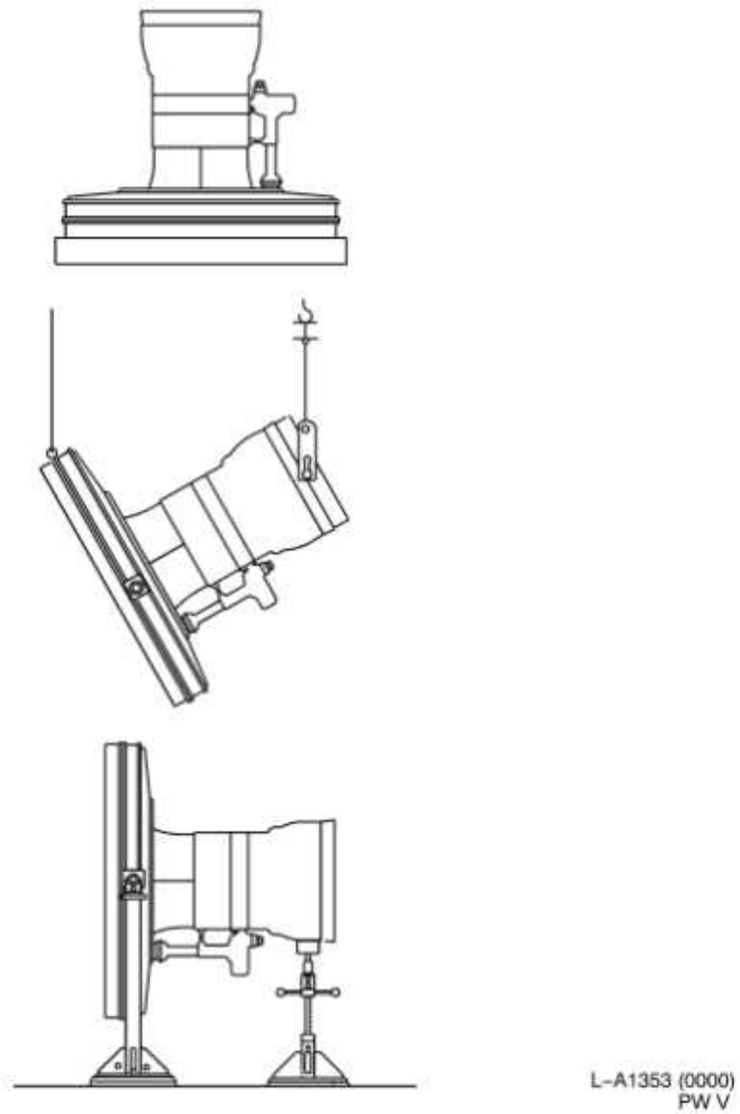
(5) Loosen knobs in center hub and install PWA 85243 Plug into center hub against 2nd stage hub. Secure plug in position using fixture knobs.

(6) Install the PWA 86617 Retainer into the hub of the fixture and into the inner diameter of the HPC rear hub. Attach the retainer to the center hub of the fixture.

(7) With hoist and sling attached to fixture attach second hoist to eye on intermediate case. Remove bolts and nuts securing case to stands and raise engine from stands. Trunnion engine to horizontal position.

(8) Position two PWA 25757 Pedestals with two PWA 25926 Adapters under brackets on intermediate case. Install PWA 85062 Saddle on either PWA 87359 or PWA 26157 Pedestal and secure with ball lock pin. Position saddle under diffuser case at 6 o'clock location just forward of Flange M.

(9) Lower engine on pedestals and saddle. Remove hoist and eye from intermediate case. Remove retainer and plug from rear fixture. Using hoist and sling attached, remove fixture. Remove ring from diffuser case.



Trunnion Intermediate Case Through
HPT To Horizontal
Figure 201
(Task 72-00-00-420-001)

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-00-00-020-002-A:

1. Trunnion Intermediate Case Through Diffuser And Combustor From Horizontal To Front End Down Position

NOTE: See Paragraph 2. for optional method for trunnioning intermediate case through diffuser and combustor from horizontal to front end down position.

A. Equipment And Materials Required

Special Tools:
PWA 28657 Sling
PWA 76156 Adapter (2 Necessary)
PWA 85064 Fixture, Handling
PWA 85246 Plug, Support
PWA 85623 Eye, Lifting
PWA 85678 Stand, Support (3 Necessary) (Optional to PWA 87166/PWA 101960)
PWA 87166 Stand, Support (3 Necessary)
PWA 101960 Adapter, Support (3 Necessary)
PWA 88709 Plug, Holding

B. Procedure

See Figure 201.

NOTE: If there is a bolt in one of the holes of the 12 o'clock ground handling pad that you cannot remove, you must repair the intermediate case. Refer to 72-00-34, Repair-01 (Task 72-00-34-300-001).

(1) Position PWA 85623 Eye to ground handling boss at 12 o'clock location on outer intermediate case. Secure eye to case with bolts. Torque bolts to 675 - 750 lb-in. (76.265 - 84.739 N.m).

(2) Thread PWA 85246 Plug onto HPC rear hub at center of diffuser case,

(3) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3 (Pre SB PW4ENG 72-562) Thread the PWA 85246 Plug onto the HPC rear hub at the center of the diffuser case.

(4) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3 (Post SB PW4ENG 72-562) Thread the PWA 88709 Plug onto the HPC rear shaft at the center of the diffuser case.

(5) Using PWA 28657 Sling with two PWA 76156 Adapters attached to trunnion spools of PWA 85064 Fixture, position fixture over plug and onto diffuser case. Align dowel pin hole in case with fixture. Secure fixture to case with bolts.

(6) With hoist and sling attached to fixture attach second hoist to eye on intermediate case and raise engine from pedestals and saddle. Trunnion engine to front end down.

CAUTION: BE SURE PINS ARE PROPERLY SECURED IN PLACE.

(7) Lower engine to rest intermediate case on three PWA 85678 Support Stands or three PWA 87166 Stands with PWA 101960 Adapters positioned 120 degrees apart. Secure stands to case with detail bolts and nuts.

NOTE: Stands are adjustable for height. Be sure all three stands are locked for equal height.

(8) Remove hoist, eye and brackets from intermediate case.

(9) Remove fixture from case, using hoist with sling and adapters. Remove plug from HPC rear hub.

Task 72-00-00-020-002-B:

2. Trunnion Intermediate Case Through Diffuser And Combustor From Horizontal To Front End Down Position - Optional Method

A. Equipment And Materials Necessary

Special Tools:
PWA 85678 Stand, Support (3 Necessary) (Optional to PWA 87166/ PWA 101960)
PWA 86020 Eye, Lifting
PWA 86090 Spacer, Trunnioning
PWA 87166 Stand, Support (3 Necessary)
PWA 101960 Adapter, Support (3 Necessary)

B. Procedure

See Figure 202.

NOTE: If there is a bolt in one of the holes of the 12 o'clock ground handling pad that you cannot remove, you must repair the intermediate case. Refer to 72-00-34, Repair-01 (Task 72-00-34-300-001).

Figure 201
(Task 72-00-00-020-002-A)

(1) Position PWA 85623 Eye to ground handling boss at 12 o'clock location on outer intermediate case. Secure eye to case with bolts. Torque bolts to 675 − 750 lb−in. (76.265 − 84.739 N.m).

(2) Install PWA 86090 Spacer over HPC rear hub until it touches the No. 3 bearing rear seat.

(3) Thread the PWA 86020 Lifting Eye onto the rear of the HPC rear hub until the lifting eye touches the Spacer (PWA 86090).

(4) Attach a hoist to Lifting Eye (PWA 86020) and a second hoist to Eye (PWA 85623) on the intermediate case. Lift and trunnion engine to front end down.

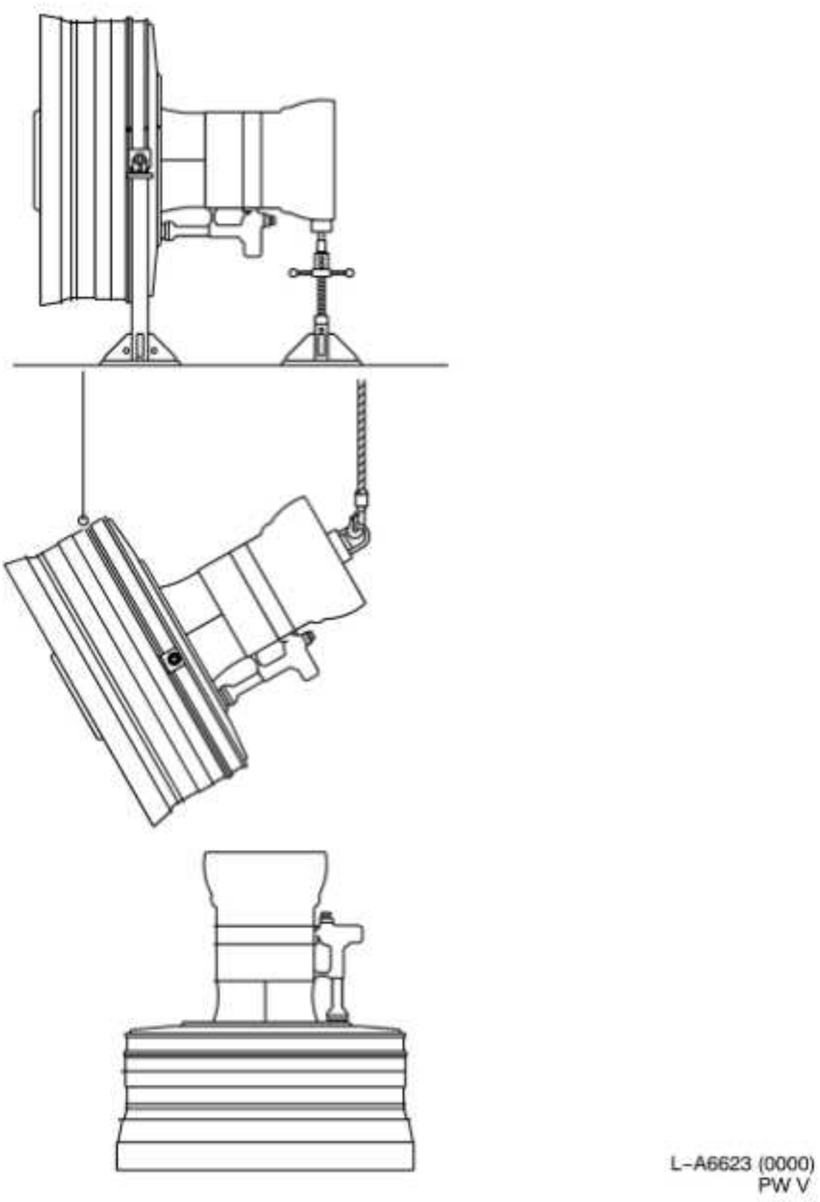
CAUTION: BE SURE PINS ARE PROPERLY SECURED IN PLACE.

(5) Lower engine to rest intermediate case on three PWA 85678 Support Stands or PWA 87166 Stands with PWA 101960 Adapters positioned 120 degrees apart. Secure stands to case with detail bolts and nuts.

NOTE: Stands are adjustable for height. Be sure all three stands are locked for equal height.

(6) Remove hoist, eye and brackets from intermediate case.

(7) Remove lifting eye and spacer from HPC rear hub.



Trunnion Intermediate Case Through
Diffuser Case To Front End Down
Figure 202
(Task 72−00−00−020−002−B)

Task 72-00-00-420-002-A:

1. Trunnion Intermediate Case Through Diffuser And Combustor From Front End Down To Horizontal Position

NOTE: See Paragraph 2. for optional method for trunnioning intermediate case through diffuser and combustor from front end down to horizontal position.

A. Equipment And Materials Required

Special Tools:
PWA 25757 Pedestal (2 Required)
PWA 25926 Adapters (2 Required)
PWA 26157 Pedestal (Optional to PWA 87359)
PWA 28657 Sling
PWA 76156 Adapter (2 Required)
PWA 85062 Saddle
PWA 85064 Fixture, Handling
PWA 85246 Plug, Support
PWA 85623 Eye, Lifting
PWA 85662 Bracket (2 Required)
PWA 87359 Pedestal
PWA 88709 Plug, Holding

B. Procedure

See Figure 201.

NOTE: If there is a bolt in one of the holes of the 12 o'clock ground handling pad that you cannot remove, you must repair the intermediate case. Refer to 72-00-34, Repair-01 (Task 72-00-34-300-001).

(1) Install two PWA 85334 Bracket to ground handling bosses at 3 and 9 o'clock locations on intermediate case. Secure brackets with four bolts and torque bolts to 675 - 750 lb-in. (76.265 - 84.739 N.m).

(2) Install PWA 85623 Eye to ground handling boss at 12 o'clock location on outer intermediate case. Secure eye to case with bolts. Torque bolts to 675 - 750 lb-in. (76.265 - 84.739 N.m).

(3) Thread PWA 85246 Plug onto HPC rear hub at center of diffuser case.

(4) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3 (Pre SB PW4ENG 72-562) Thread the PWA 85246 Plug onto the HPC rear hub at the center of the diffuser case.

(5) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
(Post SB PW4ENG 72−562) Thread the PWA 88709 Plug onto the HPC rear shaft at the center of the diffuser case.

(6) Using PWA 28657 Sling with two PWA 76156 Adapters attached to trunnion spools of PWA 85064 Fixture, position fixture over plug and onto diffuser case. Align dowel pin hole in case with fixture. Secure fixture to case with bolts. Tighten center hub clamping knobs.

(7) With hoist and sling attached to fixture raise engine from stands to allow for bolt removal. Attach second hoist to eye on intermediate case and trunnion engine to horizontal position.

(8) Position two PWA 25757 Pedestals with two PWA 25926 Adapters under brackets on intermediate case. Install PWA 85062 Saddle on either PWA 87359 or PWA 26157 Pedestal and secure with ball lock pin. Position saddle under diffuser case at 6 o'clock location just forward of Flange M.

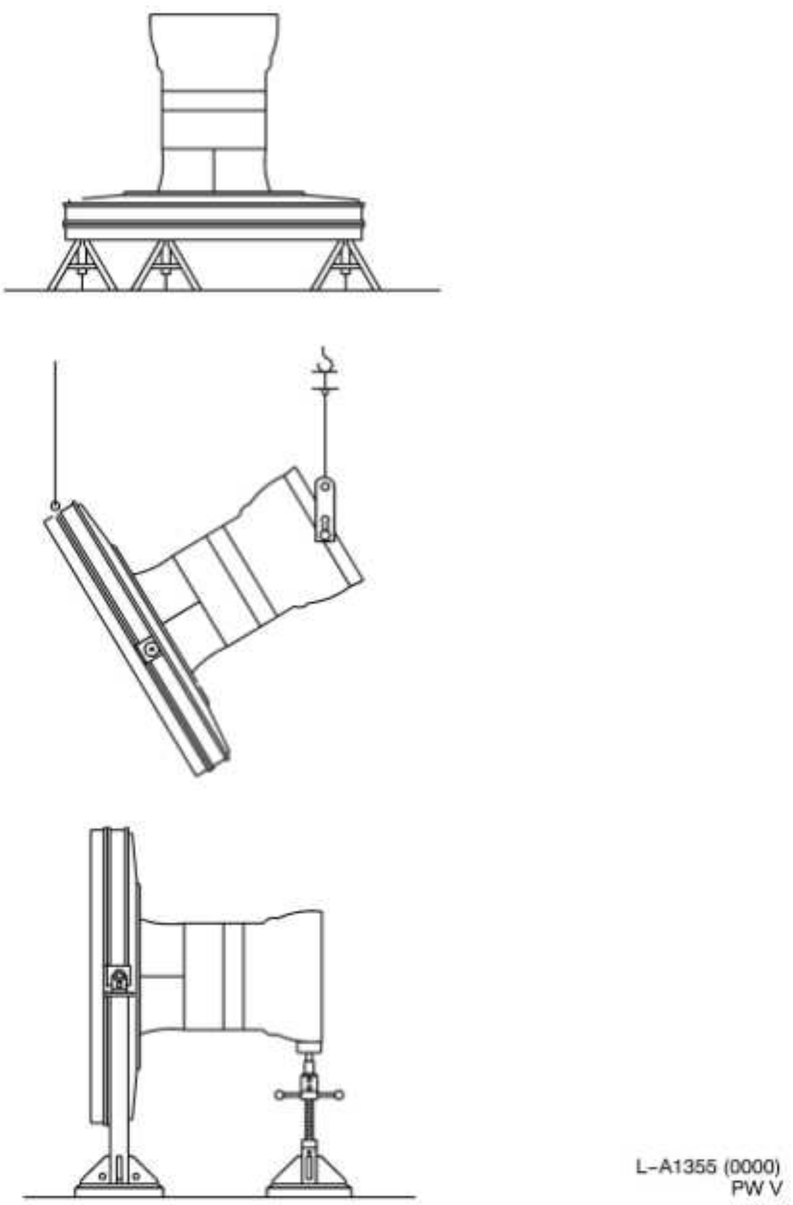
(9) Lower engine on pedestals and saddle. Remove hoist and eye from intermediate case. Remove fixture and plug from diffuser case.

Task 72−00−00−420−002−B:

2. Trunnion Intermediate Case Through Diffuser And Combustor From Front End Down To Horizontal Position − Optional Method

A. Equipment And Materials Required

Special Tools:
PWA 25757 Pedestal (2 Required)
PWA 25926 Adapters (2 Required)
PWA 26157 Pedestal
PWA 85062 Saddle
PWA 85623 Eye, Lifting
PWA 85662 Bracket (2 Required)
PWA 86020 Eye, Lifting
PWA 86090 Spacer, Trunnion



Trunnion Intermediate Case Through
Diffuser Case To Horizontal
Figure 201
(Task 72−00−00−420−002−A)

B. Procedure

See Figure 202.

NOTE: If there is a bolt in one of the holes of the 12 o'clock ground handling pad that you cannot remove, you must repair the intermediate case. Refer to 72−00−34, Repair−01 (Task 72−00−34−300−001).

(1) Install two PWA 85662 Bracket to ground handling bosses at 3 and 9 o'clock locations on intermediate case. Secure brackets with four bolts and torque bolts to 675 − 750 lb−in. (76.265 − 84.739 N.m).

(2) Install PWA 85623 Eye to ground handling boss at 12 o'clock location on outer intermediate case. Secure eye to case with bolts. Torque bolts to 675 − 750 lb−in. (76.265 − 84.739 N.m).

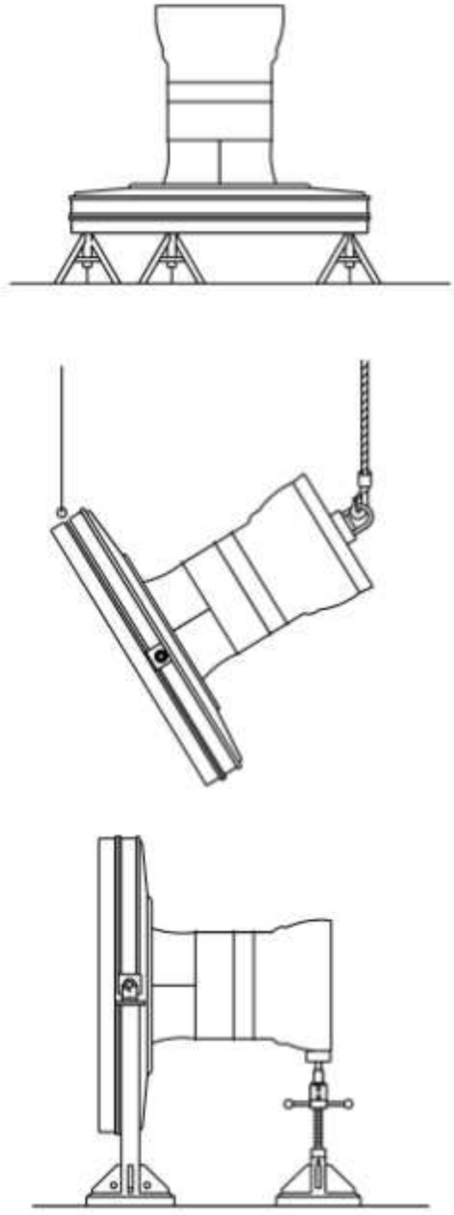
(3) Install PWA 86090 Spacer over HPC rear hub until it touches the No. 3 bearing rear seat.

(4) Thread the PWA 86020 Lifting Eye onto the rear of the HPC rear hub until the lifting eye touches the Spacer (PWA 86090).

(5) Attach a hoist to Lifting Eye (PWA 86020) and a second hoist to Eye (PWA 85623) on the intermediate case. Lift and trunnion engine to horizontal position.

(6) Position two PWA 25757 Pedestals with two PWA 25926 Adapters under brackets on intermediate case. Install PWA 85062 Saddle on PWA 26157 Pedestal and secure with ball lock pin. Position saddle under diffuser case at 6 o'clock location just forward of Flange M.

(7) Lower engine on pedestals and saddle. Remove hoist and eye from intermediate case. Remove lifting eye and spacer from HPC rear hub.



Trunnion Intermediate Case Through
Diffuser Case To Horizontal
Figure 202
(Task 72−00−00−420−002−B)

ENGINE GENERAL - SPECIAL PROCEDURES-11

Task 72-00-00-830-005:

1. Rig The Turbine Case Cooling (TCC) Control System-Complete Rig With Standard Rigging Pins

NOTE: Use this procedure only:

- After the replacement of the (TCC) air valve control cable and/or
- After the assembly of the entire turbine case cooling control system during the engine build-up
- If the turbine case cooling control system can not be rigged per Special Procedures-06.

NOTE: Use the partial rigging procedure in Special Procedures-06

- After the replacement of the (TCC) HPT air shutoff valve and/or
- After the replacement of the (TCC) LPT air shutoff valve and/or
- After the replacement of the (TCC) air valve actuator
- For a check of the entire turbine case cooling control system.

A. Equipment And Materials Required

Special Tools:

PWA 85465	Rigging Pin (3 Necessary)

NOTE: Above rigging pin can be contained within the Rigging Pin Kit (PWA 85675).

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)

B. Procedure
See Figure 201.

(1) If the TCC air valve control cable was not replaced or disassembled, do steps (a) and (b). See View A.

(a) Remove the bolt (201/1) and nut (201/3) that attach the cable rod end (201/9).

(b) Remove the two bolts (201/2), nuts (201/6) and one bushing (201/4) that attach the adjuster rod ends (201/5).

CAUTION: IF YOU USE A LONGER POSITIONING BOLT OTHER THAN THE SPECIFIED BOLT LENGTH AND YOU TURN THE BOLT UNTIL IT TOUCHES BOTTOM (SEATED), YOU CAN DAMAGE THE ACTUATOR.

(2) (Reference 2010) Install a positioning bolt into the threaded positioning hole on the rear of the actuator (201/10). See View B. Turn the bolt in and align the piston shaft rig hole with the rigging hole in the actuator housing. Install a PWA 85465 Rigging Pin in the rigging hole. Feel the rigging pin installation to be sure that the pin is fully engaged into the piston shaft rigging hole.

NOTE: The positioning bolt is a quality standard hexhead bolt with a 8−32 by 1.500 inch (38.1 mm) thread length. With a 1.5 inch (38.1 mm) length bolt and when the rig pin touches bottom (fully seated), approximately 0.125 inch (3.175 mm) of the bolt threads are showing.

(3) Align the rigging pin hole in the HPT valve lever arm (201/12) with the hole in the valve housing. Install a PWA 85465 Rigging Pin. See View C.

(4) Pull the cable rod end (201/9) rearward and see if the rod end and the bolthole on the idler arm (201/11) align. Hold the idler arm (201/11) against the HPT valve lever arm (201/12) during this procedure.

NOTE: Allow no gap between the idler arm (201/11) and the HPT valve lever arm (201/12) during the entire rigging procedure.

(5) If the bolthole aligns, install the bolt (201/1) (from the inside) that attaches the cable rod end (201/9) to the idler arm (201/11). If the bolthole does not align, remove the lockwire from the rod end jamnut (201/13). Loosen the jamnut and adjust the cable rod end (201/9) to align the bolthole. Install the bolt (201/1) (from the inside). Tighten and torque the rod end jamnut (201/13) to 32 − 36 lb−in. (3.616 − 4.067 N.m). Install the Lockwire P05−289.

(6) Lubricate the threads of bolt (201/1) with Engine Oil P03−001 and install the nut (201/3). Torque the nut to 36 − 40 lb−in. (4.067 − 4.519 N.m).

NOTE: Be sure and install the cable rod end (201/9) and the head of bolt (201/1) to the inside of the idler arm (201/11).

(7) Align the rigging pin hole in the LPT valve lever arm (201/14) with the hole in the valve housing. Install one more PWA 85465 Rigging Pin. See View D.

(8) Install the forward adjuster rod end (201/5) with the bolt (201/2), lubricated with Engine Oil P03−001, bushing (201/4), and nut (201/6). Torque the nut to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View A.

NOTE: Be sure and install the bolt (201/2) from the inside and the bushing (201/4) between the idler arm (201/11) and the adjuster rod end (201/5).

(9) Pull the cable rod end (201/9) rearward. See View D. See if the rear adjuster rod end (201/5) and the LPT valve lever arm (201/14) bolthole align.

(10) If the bolthole aligns, install the bolt (201/2), (from the inside) and attach the rod end (201/5). Lubricate the bolt threads with Engine Oil P03−001 and install the nut (201/6). Torque the nut to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(11) If the bolthole does not align, remove the lockwire and loosen the two adjuster jamnuts (201/8). See View D. Turn the adjuster (201/7) and align the rod end (501/5) with the LPT valve lever arm (201/14) bolthole. Be sure rod end threads are seen through both sight holes in the adjuster. Install the bolt (201/2), lubricated with Engine Oil P03−001, and nut (201/6) and attach the rod end (201/5). Torque the nut to 36 − 40 lb−in. (4.067 − 4.519 N.m). Tighten and torque the jamnuts (201/8) to 14 − 16 lb−in. (1.582 − 1.808 N.m). Install the Lockwire P05−289.

CAUTION: BE SURE THE THREE RIGGING PINS AND THE POSITIONING BOLT ARE REMOVED FROM THE ENGINE OR DAMAGE CAN RESULT.

(12) Remove all three rigging pins. After the removal of the rigging pins, remove the positioning bolt from the rear of the actuator (201/12).

C. Postrequisite

(1) Test the engine per the Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

ENGINE GENERAL - SPECIAL PROCEDURES-12

Task 72-00-00-020-003:

1. Trunnion Fan Cases Through HPT (Without LPC) From Horizontal To Front End Down Position

A. Equipment And Materials Required

Special Tools:

PWA 28657	Sling
PWA 76156	Adapter (2 Necessary)
PWA 85064	Fixture, Handling
PWA 85243	Plug, Support
PWA 85344	Ring, Adapter
PWA 85623	Eye, Lifting
PWA 85678	Stand, Support (3 Necessary) (Optional to PWA 87166/PWA 101960)
PWA 86617	Retainer, Rotor
PWA 87166	Stand, Support (3 Necessary)
PWA 101960	Adapter, Support (3 Necessary)

B. Procedure
See Figure 201.

NOTE: If there is a bolt in one of the holes of the 12 o'clock ground handling pad that you cannot remove, you must repair the intermediate case. Refer to 72-00-34, Repair-01 Task 72-00-34-300-001.

(1) Position PWA 85623 Eye to ground handling boss at 12 o'clock location on outer intermediate case. Attach eye to case with bolts. Torque bolts to 675 - 750 lb-in. (76.265 - 84.739 N.m).

(2) Position PWA 85344 Ring onto rear flange of HPT case and attach in place.

(3) With PWA 28657 Sling with two PWA 76156 Adapters attached to trunnion spools of PWA 85064 Fixture, position fixture onto PWA 85344 Ring. Aligning dowel pin hole with dowel pin in ring, attach fixture to case with bolts.

(4) Loosen knobs in center hub and install PWA 85243 Plug into center hub against 2nd stage hub. Hold plug in position with fixture knobs.

(5) Install the PWA 86617 Retainer into the hub of the fixture and into the inner diameter of the HPC rear hub. Attach the retainer to the center hub of the fixture.

(6) With hoist and sling attached to fixture attach second hoist to eye on intermediate case and raise engine from pedestals and saddle. Trunnion engine to front end down.

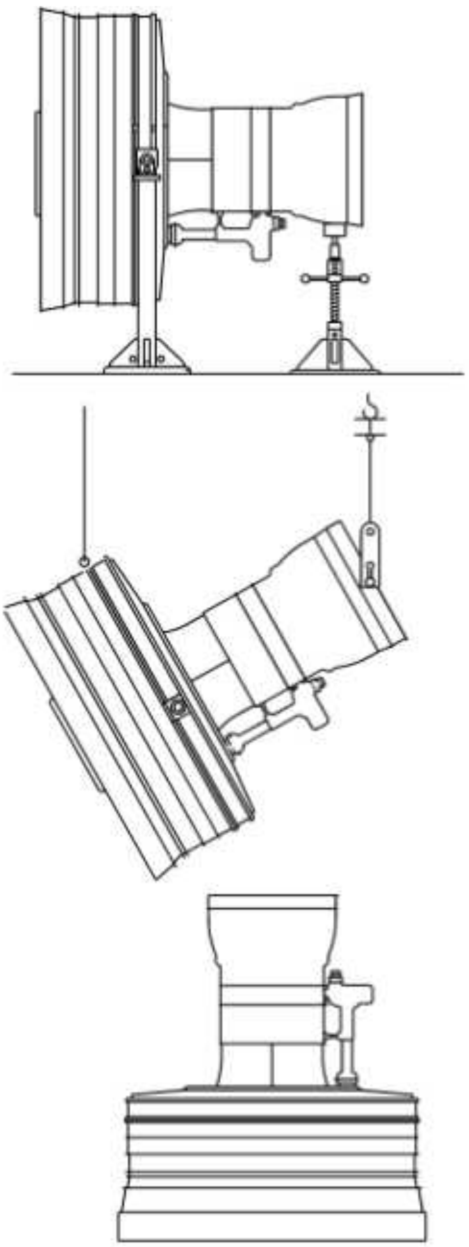
CAUTION: BE SURE PINS ARE PROPERLY SECURED IN PLACE.

(7) Position three PWA 85671 Stands or three PWA 87166 Stands with PWA 101960 Adapters approximately 120 degrees apart. Lower engine to rest on stands. Attach case to stands with detail bolts and nuts.

NOTE: Stands are adjustable for height. Be sure all stands are locked for equal height.

(8) Remove hoist, eye and brackets from intermediate case.

(9) Remove retainer and plug from fixture. With hoist, with sling and adapters attached, remove fixture from case and ring. Remove ring from case.



Trunnion Fan Cases Through HPT (Without LPC) To Front End Down
Figure 201
(Task 72−00−00−020−003)

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-00-00-420-003:

1. Trunnion Fan Cases Through HPT From Front End Down To Horizontal Position

A. Equipment And Materials Necessary

Special Tools:

PWA 25757	Pedestal (2 Necessary)
PWA 25926	Adapters (2 Necessary)
PWA 26157	Pedestal (Optional to PWA 87359)
PWA 28657	Sling
PWA 76156	Adapter (2 Necessary)
PWA 85062	Saddle
PWA 85064	Fixture, Handling
PWA 85243	Plug, Support
PWA 85344	Ring, Adapter
PWA 85623	Eye, Lifting
PWA 85662	Bracket (2 Necessary)
PWA 86617	Retainer, Rotor
PWA 87359	Pedestal
PWA 102727	Support
PWA 103636	Base, Support

B. Procedure

See Figure 201.

NOTE: If there is a bolt in one of the holes of the 12 o'clock ground handling pad that you cannot remove, you must repair the intermediate case. Refer to PW4000 Series CIR, PN 51A357.

(1) Install two PWA 85662 Bracket to ground handling bosses at 3 and 9 o'clock locations on intermediate case. Secure brackets with four bolts and torque bolts to 675 - 750 lb-in. (76.265 - 84.739 N.m).

(2) Install PWA 85623 Eye to ground handling boss at 12 o'clock location on outer intermediate case. Attach eye to case with bolts. Torque bolts to 675 - 750 lb-in. (76.265 - 84.739 N.m).

(3) Install PWA 85344 Ring onto rear flange of HPT case.

(4) Use PWA 28657 Sling with two PWA 76156 Adapters attached to trunnion spools of PWA 85064 Fixture, position fixture on PWA 85344 Ring. Aligning dowel pin hole with dowel pin in ring, attach fixture to case with bolts.

(5) Loosen knobs in center hub and install PWA 85243 Plug into center hub against 2nd stage hub. Hold plug in position with fixture knobs.

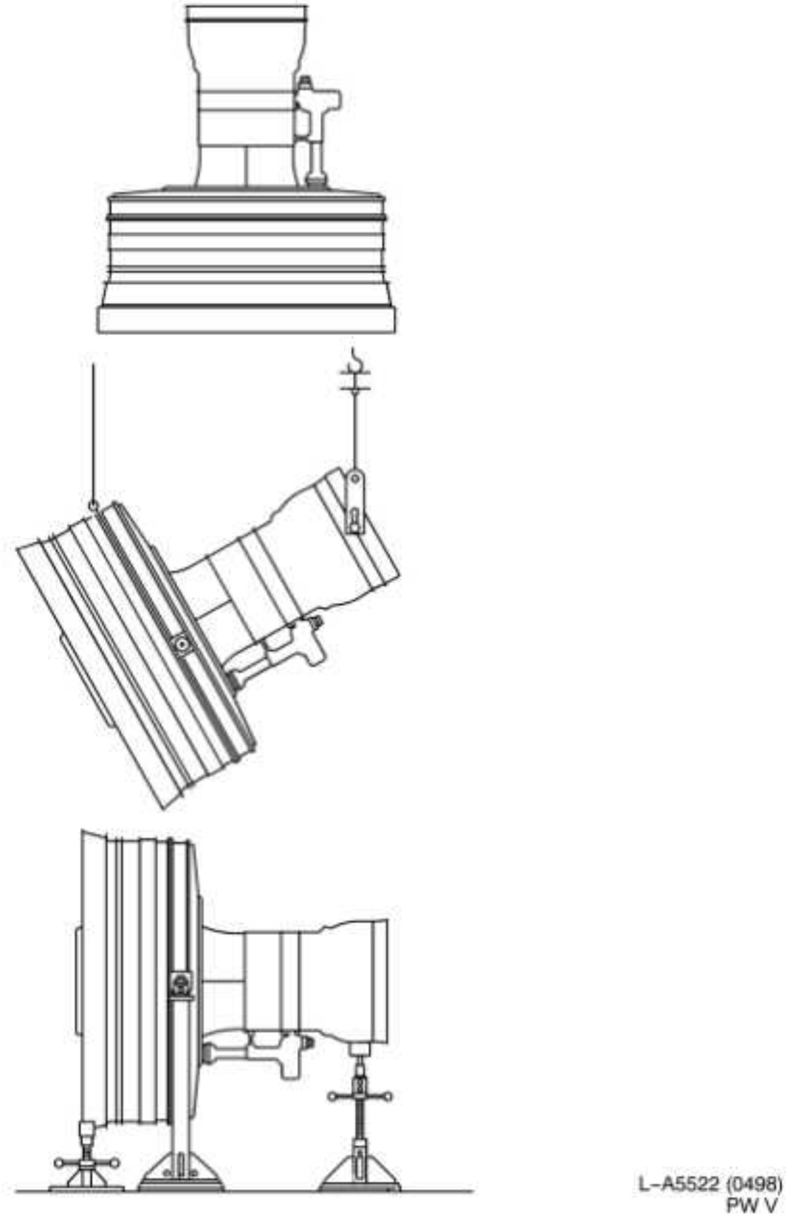
(6) Install the PWA 86617 Retainer into the hub of the fixture and into the inner diameter of the HPC rear hub. Attach the retainer to the center hub of the fixture.

(7) With hoist and sling attached to fixture attach second hoist to eye on intermediate case. Remove bolts and nuts securing case to stands and raise engine from stands. Trunnion engine to horizontal position.

(8) Position two PWA 25757 Pedestals with two PWA 25926 Adapters under brackets on intermediate case. Install PWA 85062 Saddle on either PWA 87359 Pedestal or PWA 26157 Pedestal and attach with ball lock pin. Position saddle under diffuser case at 6 o'clock location just forward of Flange M. Position PWA 102727 Support to align with Flange "A" of the fan inlet case at the 6 o'clock location.

(9) Lower engine on pedestals and saddle. Adjust the PWA 102727 Support to engage and hold the fan inlet case at Flange "A" at the 6 o'clock location. If it is necessary because of the height of the engine in the pedestals, first install the Fan Case Support (PWA 102727) in a PWA 103636 Base Support. Attach the Fan Case Support (PWA 102727) to the Base Support (PWA 103636) with the three detail bolts and nuts. Remove hoist and eye from intermediate case. Remove retainer and plug from rear fixture. With hoist and sling attached, remove fixture. Remove ring from diffuser case.

NOTE: If necessary several Base Supports (PWA 103636) can be stacked together. They must be attached to each other with the three detail bolts and nuts.



Trunnion Fan Cases Through HPT To Horizontal
Figure 201
(Task 72−00−00−420−003)

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-00-00-840-004:

1. Change The Engine Thrust Level (Only)

A. General

The purpose of this procedure is to provide directions and requirements for various thrust level conversions up to the PW4158 thrust level. This procedure does not apply to airframe model to airframe model conversions. The PW4000 engine serial numbers and related models referenced in this procedure are for those engines, as manufactured, at Pratt & Whitney. This procedure contains four separate sections that address specific subjects and requirements.

B. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Rivet (MS9319-002)	1	72-34-00/4A/XX

C. Procedure

(1) Basic engine gaspath hardware requirements for engines prior to the thrust conversion.

(a) Use the following figures and determine if the engine that you want to convert (to a higher thrust) requires Service Bulletin incorporation prior to the conversion. If you are converting your engine to a higher thrust level, incorporate the applicable Service Bulletins before you convert. If you are converting your engine to a lower thrust level, no gaspath Service Bulletin incorporation is required.

NOTE: The Service Bulletins listed on the figures with an "X" must be incorporated into the applicable engine serial numbers before you convert.

NOTE: The Service Bulletins (or their intent) listed on the figures without an "X" were previously incorporated into the applicable engine serial numbers at production manufacture.

1 For a PW4152 to a PW4156 conversion, see Figure 201 for required gaspath Service Bulletin incorporation.

2 For a PW4152 to a PW4156A/PW4158 conversion, see Figure 202 for required gaspath Service Bulletin incorporation.

3 For a PW4156 to a PW4156A/PW4158 conversion, see Figure 203 for required gaspath Service Bulletin incorporation.

(2) Replace the EEC programming plug as follows.

(a) Remove the EEC programming plug. See 72-00-33, Removal-12 (Task 72-00-33-050-007).

R (b) Get the correct part number and class EEC
R programming plug (called plug) as follows:

R 1 For engines that are changed to a higher thrust
R level and acceptance test, Testing-09 IS
R necessary. Do as follows:

R a See step (4) for the engines where 71-00-00,
R Testing-09 (Task 71-00-00-760-020) is
R necessary.

R b Get the correct plug part number from
R SB PW4ENG 73-203, "EEC EPP part number
R look-up".

R c Get the correct plug class from the
R necessary Testing-09.

R 2 For engines that are changed to a higher thrust
R level and where an acceptance test, Testing-09
R IS NOT necessary, do as follows:

R NOTE: See step (4) for the engines
R where 71-00-00, Testing-09 (Task
R 71-00-00-760-020) is necessary.

R a Get the correct plug part number from SB PW4ENG 73-203, "EEC EPP part number look-up".

R b Get the correct plug class from the "Log Of Engine Tests" supplied with the engine.

R 3 For engines that are changed to a lower thrust level, no Testing-09 is necessary. If the engines ARE acceptance tested to operate across all thrust ranges, do as follows:

R a Get the correct plug part number from SB PW4ENG 73-203, "EEC EPP part number look-up".

R b Get the correct plug class from the "Log Of Engine Tests" supplied with the engine.

R 4 For engines that are changed to a lower thrust level, no Testing-09 is necessary. If the engines ARE NOT acceptance tested at production manufacture to operate across all thrust ranges do as follows:

R a Get the correct part number plug from SB PW4ENG 73-203, "EEC EPP part number look-up".

R b Get the EPR class from the procedure given in 71-00-00, Testing-09, Paragraph P. Step (3) titled "Make a EEC programming plug selection as follows".

R (c) Install the new replacement EEC programming plug to the EEC. See 72-00-33, Installation-12 Task 72-00-33-450-007-A00 or Task 72-00-33-050-007-B00.

(3) Replace the engine (serial number) identification plate as follows:

(a) Remove the four screws and the engine (serial number) identification plate from the Flange C bracket at approximately 5 o'clock position.

(b) (Pre SB PW4ENG 72-687) For the new replacement engine identification plate, send the necessary information, as specified by Spare Parts Bulletin P0351, to:

Pratt & Whitney
Spares Management And Logistics
400 Main Street
East Hartford, CT 06108 USA

1 Install the new replacement engine identification plate to the Flange C bracket. Attach the plate with the four screws, lubricated with Engine Oil P03-001. Torque the screws to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(c) (Post SB PW4ENG 72-687) For the new replacement engine identification plate, send the necessary information, as specified by Spare Parts Bulletin P0351, to:

Pratt & Whitney
Spares Management And Logistics
400 Main Street
East Hartford, CT 06108 USA

1 Install the new replacement engine identification plate to the Flange C bracket. Attach the plate with the four screws, lubricated with Engine Oil P03-001. Torque the screws to 36 - 40 lb-in. (4.067 - 4.519 N.m).

2 If a subsequent thrust rating change occurs, install the rivet in the applicable hole in the engine identification plate that corresponds to the engines new thrust rating.

(d) Examine the data plate as follows:

1 (Pre SB PW4ENG 72-687) Verify that the correct side of the data plate is installed outward (visible).

2 Verify that the correct engine model, rating, and EEC programing plug part number and class are visible.

(4) Determine the test requirements and test the converted engine as follows.

(a) Not all converted engines require acceptance testing. Engines that are converted to a lower thrust level do not require acceptance test (71-00-00, Testing-09).

R
R

(b) Test all engines that are converted to a higher thrust level. See 71-00-00, Testing-09 Task 71-00-00-760-020.

ENGINE GENERAL - SPECIAL PROCEDURES-17

Task 72-00-00-840-007:

1. Convert An Airbus Model Engine (As Manufactured By Pratt Whitney) To A Boeing Model Engine

A. General
The purpose of this section is to provide directions and requirements for the conversion of an Airbus configured engine/power plant to a Boeing configured engine/power plant. The PW4000 engine serial numbers and related models referenced in this procedure are for those engines, as manufactured, at Pratt & Whitney. This procedure contains four separate sections that address specific subjects and requirements.

B. Equipment And Materials Required - None

C. Procedure

(1) Basic engine gaspath hardware requirements for engines prior to the airframe/thrust conversion.

NOTE: Other Service Bulletins that require external hardware changes may be required prior to the conversion. These Service Bulletins are listed in the referenced Conversion Service Bulletin PW4ENG 72-390.

(a) Use the following figures and determine if the engine that you want to convert (to a higher thrust) requires Service Bulletin incorporation prior to the conversion. If you are converting your engine to a higher thrust level, incorporate the applicable Service Bulletins before you convert. If you are converting your engine to a lower thrust level, no gaspath Service Bulletin incorporation is required.

NOTE: The Service Bulletins listed on the figures with an "X" must be incorporated into the applicable engine serial numbers before you convert.

NOTE: The Service Bulletins (or their intent) listed on the figures without an "X" were previously incorporated into the applicable engine serial numbers at production manufacture.

1 For an (Airbus) PW4152 to a (Boeing) PW4052 conversion, no gaspath Service Bulletin incorporation is required.

2 For an (Airbus) PW4152 to a (Boeing) PW4056 conversion, see Figure 201 for required gaspath Service Bulletin incorporation.

3 For an (Airbus) PW4152 to a (Boeing) PW4060/PW4060A/PW4060C conversion, see Figure 202 for required gaspath Service Bulletin incorporation.

4 For an (Airbus) PW4156 to a (Boeing) PW4056 conversion, no gaspath Service Bulletin incorporation is required.

5 For an (Airbus) PW4156 to a (Boeing) PW4060/PW4060A/PW4060C conversion, see Figure 203 for required gaspath Service Bulletin incorporation.

6 For an (Airbus) PW4156A/PW4158 to a (Boeing) PW4060/PW4060A/PW4060C conversion, see Figure 204 for required gaspath Service Bulletin incorporation.

(2) If installed, remove all the Airbus nacelle (EBU/QEC) parts from the mountable power plant so that the engine is in the basic (bare) configuration. See the removal procedures in the 71-00-00 Chapter Sections.

(3) Replace the necessary (Airbus unique) external engine parts with the necessary (Boeing unique) external engine parts. See Conversion Service Bulletin PW4ENG 72-390.

(4) After the accomplishment of the conversion Service Bulletin PW4ENG 72-390, continue the conversion procedure in the (Boeing model) Engine Manual (Part Number 50A605), 72-00-00, Special Procedures-18 Task 72-00-00-840-009.

ENGINE GENERAL - SPECIAL PROCEDURES-18

Task 72-00-00-840-010:

1. Complete The Conversion Of A Boeing Model Engine (As Manufactured By Pratt & Whitney) To An Airbus Model Engine

A. Prerequisites

(1) Start the conversion procedure for a Boeing model engine (as manufactured by Pratt & Whitney) to an Airbus model engine. See the (Boeing model) Engine Manual (Part Number 50A605), 72-00-00, Special Procedures-17 Task 72-00-00-840-006.

(2) Complete the Conversion Service Bulletin PW4ENG 72-389.

B. General

The purpose of this procedure is to provide directions and requirements to complete the conversion of a Boeing model engine (as manufactured by Pratt & Whitney) to an Airbus model engine. You must complete Conversion Service Bulletin PW4ENG 72-389 before you do this procedure. This procedure contains directions for the procurement of an engine (serial number) identification plate and the test requirements for the converted engine.

C. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

D. Procedure

(1) Replace the engine (serial number) identification plate, as follows.

(a) Send the necessary information, as specified by Spare Parts Bulletin P0351, to:

Pratt & Whitney
Customer Engine Performance Group
400 Main Street
East Hartford, CT 06108 USA

(b) Install the new replacement engine identification plate to the Flange C bracket. Attach the plate with the four screws, lubricated with Engine Oil P03-001. Torque the screws to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(c) Examine the data plate as follows:

1 Verify that the correct side of the data plate is installed outward (visible).

2 Verify that the correct engine model, rating, and EEC programing plug part number and class are visible.

(2) Do an acceptance test on all airframe model converted engines. See 71−00−00, Testing−09 Task 71−00−00−760−020.

ENGINE GENERAL - SPECIAL PROCEDURES-19

Task 72-00-00-840-013:

1. Convert An Airbus Model Engine (As Manufactured By Pratt Whitney) To A McDonnell Douglas Model Engine

A. General
The purpose of this section is to provide directions and requirements for the conversion of an Airbus configured engine/power plant to a McDonnell Douglas configured engine/power plant. The PW4000 engine serial numbers and related models referenced in this procedure are for those engines, as manufactured, at Pratt & Whitney. This procedure contains four separate sections that address specific subjects and requirements.

B. Equipment And Materials Required - None

C. Procedure

(1) Basic engine gaspath hardware requirements for engines prior to the airframe/thrust conversion.

NOTE: Other Service Bulletins that require external hardware changes may be required prior to the conversion. These Service Bulletins are listed in the referenced Conversion Service Bulletin PW4ENG 72-401.

(a) Use the following figures and determine if the engine that you want to convert (to a higher thrust) requires Service Bulletin incorporation prior to the conversion. If you are converting your engine to a higher thrust level, incorporate the applicable Service Bulletins before you convert. If you are converting your engine to a lower thrust level, no gaspath Service Bulletin incorporation is required.

NOTE: The Service Bulletins listed on the figures with an "X" must be incorporated into the applicable engine serial numbers before you convert.

NOTE: The Service Bulletins (or their intent) listed on the figures without an "X" were previously incorporated into the applicable engine serial numbers at production manufacture.

ENGINE GENERAL − SPECIAL PROCEDURES−19

1 For an (Airbus) PW4152 to a (McDonnell Douglas) PW4460 conversion, see Figure 201 for required gaspath Service Bulletin incorporation.

2 For an (Airbus) PW4156 to a (McDonnell Douglas) PW4460 conversion, see Figure 202 for required gaspath Service Bulletin incorporation.

3 For an (Airbus) PW4156A/PW4158 to a (McDonnell Douglas) PW4460 conversion, see Figure 203 for required gaspath Service Bulletin incorporation.

(2) If installed, remove all the Airbus nacelle (EBU/QEC) parts from the mountable power plant so that the engine is in the basic (bare) configuration. See the removal procedures in the 71−00−00 Chapter Sections.

(3) Replace the necessary (Airbus unique) external engine parts with the necessary (McDonnell Douglas unique) external engine parts. See Conversion Service Bulletin PW4ENG 72−401.

(4) After the accomplishment of the conversion Service Bulletin PW4ENG 72−401, continue the conversion procedure in the (McDonnell Douglas model) Engine Manual (Part Number 50A822), 72−00−00, Special Procedures−18 Task 72−00−00−840−011.

ENGINE GENERAL - SPECIAL PROCEDURES-20

Task 72-00-00-840-016:

1. Complete The Conversion Of A McDonnell Douglas Model Engine (As Manufactured By Pratt & Whitney) To An Airbus Model Engine

A. Prerequisites

(1) Start the conversion procedure for a McDonnell Douglas model engine (as manufactured by Pratt & Whitney) to an Airbus model engine. See the (McDonnell Douglas model) Engine Manual (Part Number 50A822), 72-00-00, Special Procedures-17 Task 72-00-00-840-008.

(2) Complete the Conversion Service Bulletin PW4ENG 72-400.

B. General

The purpose of this procedure is to provide directions and requirements to complete the conversion of a McDonnell Douglas model engine (as manufactured by Pratt & Whitney) to an Airbus model engine. You must complete Conversion Service Bulletin PW4ENG 72-400 before you do this procedure. This procedure contains directions for the procurement of an engine (serial number) identification plate and the test requirements for the converted engine.

C. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

D. Procedure

(1) Replace the engine (serial number) identification plate, as follows.

(a) Send the necessary information, as specified by Spare Parts Bulletin No. P0351, to:

Pratt & Whitney
Customer Engine Performance Group
400 Main Street
East Hartford, CT 06108 USA

(b) Install the new replacement engine identification plate to the Flange C bracket. Attach the plate with the four screws, lubricated with Engine Oil P03-001. Torque the screws to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(c) Examine the data plate as follows:

1 Verify that the correct side of the data plate is installed outward (visible).

2 Verify that the correct engine model, rating, and EEC programing plug part number and class are visible.

(2) Do an acceptance test on all airframe model converted engines. See 71-00-00, Testing-09 Task 71-00-00-760-020.

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-00-00-020-004:

1. Trunnion The Fan Unit (Stage 1 Blades Not Installed) From Horizontal Position To Rear End Down

A. Prerequisites

(1) Remove the fan-unit from the core engine. Refer to
R 72-00-34, Removal-21 (Task 72-00-34-020-004).

(2) Remove the Stage 1 LPC blade assemblies. Refer to 72-00-31, Removal-04 (Task 72-00-31-020-002-002).

B. Equipment And Materials

Special Tools:

PWA 76154	Adapters (2 Necessary)
PWA 76155	Sling
PWA 85623	Eye
PWA 86567	Adapters (2 Necessary)

CAUTION: DO NOT DO THIS PROCEDURE IF THE LPC/LPT COUPLING OR THE STAGE 1 LPC BLADE ASSEMBLIES ARE INSTALLED. FAILURE OF THE TOOL CAN OCCUR.

C. Procedure

See Figure 201.

(1) If not installed, attach PWA 86567 Adapter to Flanges A and B of the fan case at 3 and 9 o'clock positions. Use the detail washers and screws.

(2) If not installed, attach PWA 85623 Eye to the pad on the intermediate case at 12 o'clock position. Use the detail screws.

(3) Hang two PWA 76154 Adapters in the hooks of PWA 76155 Sling.

(4) Put the trunnion spools of PWA 86567 Adapters in the holes of PWA 76154 Adapters. With one hoist at the sling and another hoist at the eye, trunnion the fan unit to rear end down.

(5) Remove the tools.

ENGINE GENERAL - SPECIAL PROCEDURES-22

Task 72-00-00-420-004:

1. Trunnion The Fan Unit (Stage 1 Blades Not Installed) From Rear End Down To Horizontal Position

A. Equipment And Materials

Special Tools:
PWA 25757 Pedestal (4 Necessary)
PWA 25926 Adapters (4 Necessary)
PWA 76154 Adapters (2 Necessary)
PWA 76155 Sling
PWA 85623 Eye
PWA 85662 Bracket (2 Necessary)(Optional to PWA 85667)
PWA 85667 Bracket (2 Necessary)
PWA 86567 Adapters (2 Necessary)

B. Procedure

See Figure 201.

(1) Attach PWA 86567 Adapter to Flanges A and B of the fan case at 3 and 9 o'clock positions. Use the detail washers and screws.

(2) Attach PWA 85623 Eye to the pad on the intermediate case at 12 o'clock position. Use the detail screws.

(3) Hang two PWA 76154 Adapters in the hooks of PWA 76155 Sling.

(4) Put the trunnion (small) spools of PWA 86567 Adapter in the holes of PWA 76154 Adapters. With one hoist at the sling and another hoist at the eye, trunnion the fan unit to horizontal position.

(5) If you want to support the fan unit on pedestals, do as follows:

    (a) Install two PWA 85662 or PWA 85667 Adapters to the intermediate case at 3 and 9 o'clock.

    (b) Install four PWA 25926 Adapters on four PWA 25757 Pedestals.

    (c) Install the trunnion spools attached to the fan unit in the adapters that are on the pedestals.

    NOTE: Use the large inner spools of the adapters and brackets for support on the pedestals.

Task 72-00-00-910-001:

1. Hydraulic Pump Service And Operation

A. General

(1) Use this procedure for the service or operation of the PWA 49030 Hydraulic Pump or the CTE 5100 Hydraulic Pump. The CTE 5100 Hydraulic Pump replaces the PWA 49030 Hydraulic Pump.

(2) Either hydraulic pump is available with an air driven pneumatic motor or an electric motor. All pumps must be serviced with clean filtered Calibrating Fluid P03-003.

(3) These pumps are used for many applications and for other engine models. Make sure that you have the necessary adapters, elbows, and fittings for your application. The adjustment procedure specifies the correct adapters to connect the hoses to the actuator.

(4) This procedure has the tasks necessary to operate the pneumatic motor or electric motor driven pumps.

B. Equipment And Materials Necessary

Special Tools:

CTE 5100	Hydraulic Pump (Optional to PWA 49030)
PWA 49030	Hydraulic Pump (Optional to CTE 5100)

Consumable Materials:

Item No.	Designation
P03-003	Fluid, Calibrating

C. Pump Operation - Pneumatic Motor Driven
See Figure 201.

(1) Check the hoses as follows:

(a) Make sure the pressure Hose A is connected to the pressure adapter of the actuator.

(b) Make sure the return Hose B is connected to the return adapter of the actuator.

(2) Service the pump reservoir as follows:

(a) Remove the Oil Fill plug at the top of the pump reservoir.

(b) Examine the level of fluid in the reservoir.

(c) If you cannot see the fluid level, add clean filtered Calibrating Fluid P03−003 until full.

(d) Install the Oil Fill plug.

(3) Before you connect an air supply to the pump, do a check of the controls and valves as follows:

(a) Put the Control Handle to the neutral position (center).

(b) Turn the Hydraulic Valve Handle to the closed position (perpendicular to flow).

(c) Turn the Air Supply Valve Handle to the closed position (perpendicular to the flow).

(d) Turn the Small Adjustment Knob (clockwise) to stop. Do not over tighten the knob.

(4) Connect an air supply hose to the pump air supply connector.

WARNING: MAKE SURE ALL PERSONS AND TOOLS ARE AWAY FROM THE MECHANICAL PARTS OF THE SYSTEM THAT YOU ARE ADJUSTING. WHEN YOU START THE PUMP, THE ACTUATOR MAY MOVE. IF YOU DO NOT DO THIS, YOU CAN CAUSE INJURY OR DAMAGE TO THE ENGINE.

(5) Operate the pump to supply hydraulic pressure to the applicable actuator as follows:

(a) Turn the Air Supply Valve Handle to the open position (parallel to the flow).

(b) Lift and turn the Large Adjustment Knob clockwise to raise the pressure on the small hydraulic pressure gauge.

NOTE: The pump ratio is 1 to 10 (30 psig air equals 300 psig hydraulic)

1 See the applicable adjustment procedure for the correct pressure.

(c) Turn the Hydraulic Valve Handle to the open position (parallel with flow).

(d) Slowly turn the Smaller Adjustment Knob counterclockwise until the air motor turns.

NOTE: The smaller adjustment knob controls the speed of the actuator and the pressure recovery after actuation. Adjust as necessary.

NOTE: With the Control Handle in the neutral position (central), the hydraulic pressure will be 0 psig on the large gage.

1 See the applicable adjustment procedure for the correct pressure.

(e) Put the Control Handle of the hydraulic cart to the advanced position (toward hoses).

(6) Use the applicable Electrical Control Box to extend and retract the actuator.

NOTE: You do not use the pump valves to extend or retract the actuator.

(7) After the adjustment, disconnect and remove the equipment as follows:

(a) Turn the Air Supply Valve Handle to the closed position (perpendicular to the flow).

(b) Disconnect the air supply hose from the pump air supply connector.

(c) Put the Control Handle to the neutral position (center).

(d) Disconnect the hoses from the actuator and install protection covers to the ends.

D. Pump Operation − Pneumatic Motor Driven
See Figure 202.

(1) Check the hoses as follows:

(a) Make sure the return hose is connected to the return adapter of the actuator.

(b) Make sure the pressure hose A or B is connected to the pressure adapter of the actuator.

(c) Install a No. 6 plug to the end of the hose that is being used.

(d) Tighten the plug with a wrench.

NOTE: Do not use aluminum or plastic dust covers. Make sure you use fittings that will seal the hose when you put pressure to the hose.

(2) Service the pump reservoir as follows:

(a) Examine the sightglass on the side of the pump reservoir.

(b) If you cannot see the fluid level, service the pump as follows:

1 Remove the fill cap.

2 Add clean filtered Calibrating Fluid P03−003 until full.

3 Install the fill cap.

(3) Before you connect an air supply to the pump, do a check of the controls and valve as follows:

(a) Turn the Air Supply Valve to CLOSED (perpendicular to the flow).

(b) Lift and turn the Hydraulic Pressure Adjustment Knob towards OFF (MINUS) (to the counterclockwise stop).

(c) Move the Hydraulic Flow Control Valve to NEUTRAL (middle position).

(4) Connect an air supply hose to the pump air supply connector.

WARNING: MAKE SURE ALL PERSONS AND TOOLS ARE AWAY FROM THE MECHANICAL PARTS OF THE SYSTEM THAT YOU ARE ADJUSTING. WHEN YOU START THE PUMP, THE ACTUATOR MAY MOVE. IF YOU DO NOT DO THIS, YOU CAN CAUSE INJURY OR DAMAGE TO THE ENGINE.

(5) Operate the pump to supply hydraulic pressure to the applicable actuator as follows:

(a) Turn the Air Supply Valve to OPEN (parallel to the flow).

NOTE: The air flow out of the air vent will stop when the valve is full open. Do not install a plug to the vent hole.

(b) Lift and turn the Hydraulic Pressure Adjustment Knob towards ON (PLUS) only until the correct pressure is on the larger hydraulic pressure gauge.

(c) See the adjustment procedure for the correct pressure.

(d) Move the Hydraulic Flow Control valve to pressurize the hose that is connected to the actuator.

(e) Lift and turn the Hydraulic Pressure Adjustment Knob as necessary to keep the correct pressure during the adjustment.

(6) Use the applicable Electrical Control Box to extend and retract the actuator.

NOTE: You do not use the pump valves to extend or retract the actuator.

(7) After the adjustment, disconnect and remove the equipment after the adjustment as follows:

(a) Move the Hydraulic Flow Control Valve to NEUTRAL (middle position).

(b) Lift and turn the Hydraulic Pressure Adjustment Knob towards OFF (MINUS) (to counterclockwise stop).

(c) Turn the Air Supply Valve to CLOSED (perpendicular to flow).

(d) Disconnect the air supply.

(e) Move the Hydraulic Flow Control Valve from A to B a few times to bleed any pressure in the hoses.

(f) Disconnect the hoses from the actuator and install protection covers to the ends.

E. Pump Operation − Electric Motor Driven
See Figure 203.

(1) Check the hoses as follows:

(a) Make sure the return hose is connected to the return adapter of the actuator.

(b) Make sure the pressure hose A is connected to the pressure adapter of the actuator.

(c) Install a No. 6 cap to the B1 and B2 pressure port adapters (not used) on the pump.

(d) Tighten the caps with a wrench.

NOTE: Do not use aluminum or plastic dust covers. Make sure you use fittings that will seal the adapters if pressurized.

(2) Service the pump reservoir as follows:

(a) Remove the reservoir fill plug.

(b) If you cannot see the fluid level, service the pump as follows:

1 Add clean filtered Calibrating Fluid P03−003 until full.

2 Install the fill cap.

(3) Before you connect the pump to the power supply, set the controls and valves as follows:

(a) Turn the Power Supply Switch to OFF.

(b) Turn the Supply Valve B and Bypass Valve B to CLOSED (to clockwise stop).

(c) Turn the Supply Valve A and Bypass Valve A to OPEN (counterclockwise approximately 10 turns).

(d) Turn the Gauge Valve to the A position.

(e) Move the Hydraulic Flow Control Valve to the Neutral (middle) position.

(4) Connect the power cord to the power supply.

WARNING: MAKE SURE ALL PERSONS AND TOOLS ARE AWAY FROM THE MECHANICAL PARTS OF THE SYSTEM THAT YOU ARE ADJUSTING. WHEN YOU START THE PUMP, THE ACTUATOR MAY MOVE. IF YOU DO NOT DO THIS, YOU CAN CAUSE INJURY OR DAMAGE TO THE ENGINE.

(5) Operate the pump to supply hydraulic pressure to the applicable actuator as follows:

(a) Turn the Power Switch to ON.

(b) Move the Hydraulic Flow Control Handle to the A position.

(c) Slowly close the Bypass Valve A (clockwise) only until the correct pressure is on the hydraulic pressure gauge.

1 See the adjustment procedure for the correct pressure.

(6) Use the applicable Electrical Control Box to extend and retract the actuator. Refer to the adjustment task.

NOTE: You do not use the pump valves to extend and retract the actuator.

(7) After the adjustment, disconnect and remove the equipment as follows:

(a) Open the Bypass Valve A (counterclockwise) until the pressure on the hydraulic pressure gauge is 0.

(b) Move the Hydraulic Flow Control Valve to NEUTRAL (middle position).

(c) Close the Supply Valve A (to clockwise stop).

(d) Turn the Power Supply Switch to OFF.

(e) Disconnect the power cord from the power supply.

(f) Disconnect the hoses from the actuator and install protection covers to the ends.

Task 72-00-00-830-006:

1. Adjustment Of The 2.5 Bleed Valve Actuator (Hydraulic)

A. General

(1) Use the procedure to adjust the 2.5 bleed valve actuator to the necessary limits. This procedure uses hydraulic pressure for the operation of the actuator during the adjustment. To manually rig the 2.5 bleed valve actuator, see 72-00-00, Special Procedure-03 Task 72-00-00-830-001.

NOTE: Refer to ENGINE GENERAL - SPECIAL PROCEDURES-23, Task 72-00-00-910-001 for Hydraulic Pump Service And Operation of the PWA 49030 Hydraulic Pump or the CTE 5100 Hydraulic Pump.

B. Equipment And Materials Necessary

Standard Tools:

Glenair (Electrical Connector) Soft Jawed Pliers - TG-69
Glenair (Electrical Connector) Strap Wrench - TG-70
Torque Wrench
Depth Micometer, 0 - 6 INCHES (0 - 152.4 MM)
Bergen Mechanical Crimper (Optional), Model M303, M305 or M307

Special Tools

PWA 29451	Pump Adapter
PWA 49030	Hydraulic Pump (Optional to CTE 5100)
PWA 85842	Electrical Control Box
PWA 101618	Pump Adapter (Elbow) (2 Necessary)
CTE 5100	Hydraulic Pump (Optional to PWA 49030)

NOTE: Make sure the correct adapters are with the Hydraulic Pump. You can use the PWA 101618 Adapter Elbows or the equivalent No. 6 standard elbows. The elbows are necessary to connect the hoses to the adapters on the actuator.

Consumable Materials

P03−001	Oil, Engine (PWA 521B, Type II)
P03−003	Calibrating Fluid
P05−038	Cheesecloth, Unsized
P05−289	Lockwire (AS3214−02
P05−291	Cable, Safety (Optional)
P05−292	Ferrule, Safety Cable (Optional)
P06−021	Antigalling Compound (PWA 550−3)
P09−014	Silicone Rubber Sealant (PWA 36003, RTV 159)
P11−014a	Alcohol, Isopropyl

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Cotter Pin	1	75−32−00/1/50

C. Prepare For The Adjustment

NOTE: Do the following steps only if not previously done during the removal of the old 2.5 bleed actuator.

(1) Remove the fan exit liner segment (inner) which covers the actuator.

(2) Use the TG−69 Glenair Soft Jawed Pliers or the TG−70 Glenair Strap Wrench to disconnect the electrical connector (W3P15) from the actuator. See Figure 201.

(3) Put a fluid drain collector/container under the actuator.

(4) Remove pressure from the hydraulic tubes as follows:

  (a) Remove the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 from the tube nuts at both ends of each of the tubes (CP06) and (CR02).

  (b) While you hold the tee with a wrench, disconnect the hydraulic pressure tube (CP06) at the (CP02) tee to remove any pressure.

  (c) While you hold the tee with a wrench, disconnect the hydraulic return tube (CR02) at the (CR04) tee to remove any pressure.

(5) Remove the bleed valve actuator hydraulic pressure tube (CP06) and return tube (CR02) as follows:

(a) Hold the adapters with a wrench and disconnect the tube nuts from the actuator.

NOTE: It is not necessary to disconnect the drain manifold (DR11) from the actuator.

(6) Connect the hoses from the PWA 49030 Hydraulic Pump or the CTE 5100 Hydraulic Pump as follows:

NOTE: If you do not know which pump to use, refer to ENGINE GENERAL − SPECIAL PROCEDURES−23, Task 72−00−00−910−001 for Hydraulic Pump Service And Operation of the PWA 49030 Hydraulic Pump or the CTE 5100 Hydraulic Pump.

(a) Install the PWA 29451 Pump Adapter to the actuator rear adapter.

(b) While you hold the rear adapter with a wrench, tighten the PWA 29451 Pump Adapter.

(c) Connect the two PWA 101618 Adapters (or equivalent elbows) to the two pump hoses (pressure and return).

(d) Tighten the hoses to the elbows.

(e) Connect the return hose elbow to the forward adapter.

(f) While you hold the forward adapter with a wrench, tighten the elbow.

(g) Connect the pressure hose elbow to the pump adapter.

(h) While you hold the pump adapter with a wrench, tighten the elbow.

(7) With the power OFF, connect the PWA 85842 Electrical Control Box Connector to the actuator receptacle. See Figure 201 (Sheet 2).

(8) Remove the shoulder bolt (201/1) from the actuator piston shaft as follows:

(a) Remove and discard the cotter pin (201/2) installed to the piston shaft and bolt (201/1).

CAUTION: BE CAREFUL WHEN YOU LOOSEN THE SHOULDER BOLT BECAUSE THE SHOULDER BOLT HAS A LEFT−HAND THREAD. IF YOU DO NOT DO THIS, YOU CAN DAMAGE THE SHOULDER BOLT AND PISTON SHAFT.

CAUTION: MAKE SURE THAT YOU HOLD THE HEX PORTION OF THE ACTUATOR PISTON SHAFT WITH A WRENCH WHEN YOU LOOSEN THE SHOULDER BOLT. IF YOU DO NOT DO THIS, YOU CAN DAMAGE THE SHOULDER BOLT AND PISTON SHAFT.

CAUTION: MAKE SURE THAT THE CRIMPED LOCKING CUP AND RETAINING NUT DO NOT LOOSEN FROM THE PISTON SHAFT WHEN THE SHOULDER BOLT IS REMOVED. IF THE RETAINING NUT CHANGES OR LOOSENS, THE INTERNAL ADJUSTMENT OF THE ACTUATOR CAN BE AFFECTED AND ACTUATOR OR ENGINE DAMAGE CAN OCCUR.

(b) Hold the piston shaft hex with a wrench and remove the shoulder bolt (201/1) (LEFT−HAND THREAD).

(9) Turn the piston shaft hex clockwise (from the rear) only until the shaft stops.

(a) Do not use too much force. This will tighten the piston shaft against the bleed valve clevis rod until bottomed.

D. Procedure

(1) Equipment Check

WARNING: MAKE SURE ALL PERSONS AND TOOLS ARE AWAY FROM THE MECHANICAL PARTS OF THE BLEED SYSTEM. WHEN YOU START THE PUMP, THE ACTUATOR CAN MOVE. IF YOU DO NOT DO

THIS, YOU CAN CAUSE INJURY OR DAMAGE THE ENGINE.

(a) Service the pump with Calibrating Fluid P03-003 and connect to a power source.

NOTE: If you do not know how to service and operate the hydraulic pump, refer to ENGINE GENERAL - SPECIAL PROCEDURES-23, Task 72-00-00-910-001 for Hydraulic Pump Service And Operation of the PWA 49030 Hydraulic Pump or the CTE 5100 Hydraulic Pump.

(b) Supply 100 psig (689.5 kPa) to the actuator aft pressure adapter.

(c) Set the POWER switch on the PWA 85842 Electrical Control Box to the ON position.

(d) Use the Electrical Box to cycle the bleed valve back and forth between open and closed positions to make sure the 2.5 bleed valve assembly moves freely.

(e) After cycling the bleed valve, leave the bleed valve in the closed position (actuator piston shaft forward).

(f) All actuation of the bleed system to the valve open or valve closed positions should now be done using the PWA 85842 Electrical Control Box OPEN/CLOSE switch.

(g) Keep 100 psig (689.5 kPa) pressure applied to the actuator during all measurements.

(2) Piston Travel Check

NOTE: All measurements must be made with 100 psig (689.5 kPa) at the actuator with a depth micrometer and from the piston shaft to the same location on the housing.

(a) Measure the length of the piston travel as follows: See Figure 202 (Sheet 1).

1 Establish a stationary reference point on the actuator housing to be used for all piston travel measurements that follow.

2 Make sure the bleed valve is in the closed (actuator piston shaft forward) position.

3 Measure the distance from the piston shaft end to the reference point on the actuator housing.

4 Record this measurement as Dimension No. 1.

5 Actuate the bleed system to the valve open (actuator piston shaft rearward) position.

6 Measure the distance from the piston shaft end to the reference point on the actuator housing.

7 Record this measurement as Dimension No. 2.

8 Determine piston travel by subtracting Dimension No. 1 from Dimension No. 2.

9 Record the result as Dimension No. 3.

10 Piston travel should be 2.280 − 2.320 inches (57.91 − 58.93 mm).

(b) If the piston travel is not within limits, repeat the measurement.

(c) If the piston travel is still not within limits, check to make sure the piston shaft is fully against the bleed valve clevis rod as follows:

1 Remove pressure to the actuator.

2 Turn the piston shaft hex clockwise (from rear) only until the shaft stops.

3 Do not use too much force.

4 This will tighten the piston shaft against the bleed valve clevis rod until bottomed.

(d) Supply 100 psig (689.5 kPa) to the actuator and do the piston travel check again.

1 If the piston travel is still not within the limits, replace the actuator and do the piston travel check for the new actuator.

(3) Set The Bleed Valve Compression

(a) Make the initial bleed valve compression adjustment as follows: See Figure 202 (Sheet 2).

1 Remove the pressure from the actuator (0 psig) (0.0 kPa)

2 Turn the piston shaft one (1) turn counterclockwise.

3 Supply 100 psig (689.5 kPa) pressure to the actuator again.

4 Actuate the bleed system to the valve closed (actuator piston shaft forward) position.

5 Measure the adjusted dimension between the piston shaft end and the established reference point on the actuator housing.

6 Record this measurement as Dimension No. 4.

7 Dimension No. 4 should be 0.015 inch (0.381 mm) minimum greater than Dimension No. 1.

(b) If Dimension No. 4 is not within the limits, do as follows;

1 Actuate the bleed system to the valve open (actuator piston shaft rearward) position.

2 Remove pressure from the actuator.

3 Turn the piston one (1) more full turn counterclockwise.

4 Supply 100 psig (689.5 kPa) pressure to the actuator again.

5 Actuate the bleed system again to the valve closed (actuator piston shaft forward) position.

6 Measure the adjusted dimension again between the piston shaft end and the established housing reference point.

7 The adjusted Dimension No. 4 should be 0.015 inch (0.381 mm) minimum greater than Dimension No. 1.

8 If Dimension No. 4 is still not within the limits, do this step again only enough times until Dimension No. 4 is within limits.

(c) Make the final compression adjustment as follows: See Figure 202 (Sheet 3).

1 Actuate the bleed system to the valve open (actuator piston shaft rearward) position.

2 Remove pressure to the actuator.

3 Turn the piston shaft 1/4 turn (90 degrees) clockwise.

4 Supply 100 psig (689.5 kPa) pressure to the actuator again.

5 Actuate the bleed system again to the valve closed (actuator piston shaft forward) position.

6 Measure the dimension between the end of the piston shaft to the established reference point on the actuator housing.

7 Record this measurement as Dimension No. 5.

8 Compare Dimension No. 5 with Dimension No. 1.

9 Dimension No. 5 should be within 0.005 inch (0.127 mm) of Dimension No. 1.

(d) If Dimension No. 5 is not within 0.005 inch (0.127 mm) of Dimension No. 1, do as follows:

1 Actuate the bleed system to the valve open (actuator piston shaft rearward) position.

2 Remove pressure to the actuator.

3 Turn the piston shaft 1/4 turn (90 degrees) clockwise.

4 Supply 100 psig (689.5 kPa) pressure to the actuator again.

5 Actuate the bleed system again to the valve closed (actuator piston shaft forward) position.

6 Measure Dimension No. 5 again.

7 Dimension No. 5 should be within 0.005 inch (0.127 mm) of Dimension No. 1.

8 If Dimension No. 5 is still not within the limits, do this step again only enough times until Dimension No. 5 is within limits.

(e) Cycle the bleed valve between the open and closed positions to verify that the 2.5 bleed valve assembly can be moved freely.

(f) Remove pressure to the actuator.

(g) Remove power to the pump.

(h) Set the POWER switch on PWA 85842 Electrical Control Box to the OFF position.

(4) Shoulder Bolt Installation

(a) Install the shoulder bolt (201/1) (LEFT−HAND THREAD) to the piston shaft as follows:

1 Apply Engine Oil P03−001 to the threads on the shoulder Bolt (201/1).

CAUTION: TO PREVENT LOSS OF ADJUSTMENT OR DAMAGE TO THE SHOULDER BOLT, MAKE SURE YOU HOLD THE ACTUATOR PISTON SHAFT HEX NUT WHEN YOU TORQUE THE SHOULDER BOLT.

2 Hold the piston shaft hex nut with a wrench and tighten the shoulder bolt (201/1) (LEFT−HAND THREAD).

3 Torque the shoulder bolt (201/1) (LEFT−HAND THREAD) to 50 − 70 lb−in. (5.649 − 7.909 N.m).

4 Remove any contamination (oil, fuel, grease, dirt, etc.) from the end of the piston shaft where you must install the cotter pin (201/2) and sealant.

5 Install the new cotter pin (201/2) to the piston shaft and shoulder bolt (201/1).

NOTE: You can turn the shoulder bolt 30 degrees maximum in either direction to install the cotter pin. This adjustment for the cotter pin will keep satisfactory torque on the shoulder bolt.

6 Apply Silicone Rubber Sealant P09−014 to both ends of the cotter pin (201/1).

(5) Remove The Adjustment Equipment

(a) Disconnect the electrical control box connector from the actuator receptacle.

CAUTION: CONNECT THE ENGINE ELECTRICAL CONNECTOR AS SOON AS POSSIBLE. IF YOU DO NOT, CONTAMINATION OF THE CONNECTION CAN OCCUR.

CAUTION: USE THE CORRECT ASSEMBLY PROCEDURE AND TOOLS FOR THE HARNESS CONNECTOR INSTALLATION. IF YOU DO NOT, A DAMAGED OR LOOSE CONNECTOR CAN OCCUR. A LOOSE CONNECTOR CAN AFFECT ENGINE OPERATION, LIGHTNING PROTECTION, AND CAUSE AN IN−FLIGHT SHUTDOWN.

(b) Connect the self−locking electrical connector (W3P15) to the actuator receptacle as follows:

1 Examine, align, and install the connector.

2 Use the Glenair TG−69 Soft Jawed Pliers or the Glenair TG−70 Strap Wrench and tighten the connector against the receptacle.

3 While you tighten, push the connector in and move side to side.

4 Make sure you can feel the ratchet feature.

5 Tighten the connector until the pliers or strap wrench slip on the connector ring.

(c) While you hold the adapters with a wrench, disconnect the hydraulic pump hoses from the two PWA 101618 Pump Adapter Elbows and the elbows from the PWA 29451 Pump Adapter and the actuators return adapter.

  1 Follow the procedure shown in Step 7 (After Adjustment), Engine General − Special Procedures−23, Task 72−00−00−910−001.

(d) While you hold the adapter with a wrench, remove the PWA 29451 Pump Adapter from the aft actuator adapter.

(e) Install the hydraulic pressure tube (CP06) and the hydraulic return tube (CR02) as follows:

  1 Apply Antigalling Compound P06−021 to the nut threads and the backs of the ferrules on both tubes.

  2 Connect the hydraulic return tube (CR02) to the forward adapter on the actuator and the (CR04) tee.

  3 While you hold the adapter and tee with a wrench, torque the (CR02) tube nuts at each end to 200 − 225 lb−in. (22.597 − 25.422 N.m)

  4 Connect the hydraulic pressure tube (CP06) to the aft adapter on the actuator and to the (CP02) tee.

  5 While you hold the adapter and tee with a wrench, torque the (CP06) tube nuts at each end to 225 − 250 lb−in. (25.422 − 28.246 N.m)

  6 Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nuts on both tubes at both ends.

(f) Install the fan exit liner segment (inner).

R ## ENGINE GENERAL - SPECIAL PROCEDURES-25

R Task 72-00-00-020-005-001:

R ## 1. Remove The HPC/Diffuser Assembly From Engine (Horizontal)

R ### A. Prerequisites

R NOTE: See Figure 301 for part/assembly removal procedure
R sequence.

R (1) Remove electronic engine control (EEC) speed transducer
R (N1) by Removal-03 (Task 72-00-34-050-001, Section
R 72-00-34).

R (2) Remove compressor inlet cone by Removal-02 (Task
R 72-00-31-020-001, Section 72-00-31).

R (3) Remove LPC/LPT coupling with a mechanical wrench or
R hydraulic wrench by Removal-01 (Task 72-00-32-020-001,
R Section 72-00-32).

R NOTE: Do not remove the Stage 1 LPC blade assemblies.

R (a) Optional: Remove low pressure compressor by
R Removal-01 (Task 72-00-31-020-003, Section
R 72-00-31).

R (4) Remove main gearbox by Removal-01 (Task
R 72-00-61-020-001, Section 72-00-61).

R (5) Remove turbine exhaust case by Removal-01 (Task
R 72-00-54-020-001, Section 72-00-54).

R (a) Optional: Remove low pressure turbine and
R turbine exhaust case with shaft (mechanical
R wrench or hydraulic wrench) by Removal-08 (Task
R 72-00-53-020-002, Section 72-00-53).

R (6) Remove low pressure turbine with shaft by Removal-01
R (Task 72-00-53-020-001, Section 72-00-53).

R (7) Remove high pressure turbine by Removal-01 (Task
R 72-00-52-020-001, Section 72-00-52).

R ### B. Equipment And Materials Necessary

ENGINE GENERAL - SPECIAL PROCEDURES-25

Special Tools:

PWA 25757	Pedestal (8 Necessary)
PWA 25926	Adapters (8 Necessary)
PWA 28657	Sling (Optional to PWA 76155)
PWA 29855-7	Pin, Aligning (2 Necessary)
PWA 76154	Adapter (2 Necessary)
PWA 76155	Sling
PWA 85064	Fixture
PWA 85246	Plug
PWA 85260	Pin, Guide (2 Necessary)
PWA 85390	Adapter, Lifting
PWA 85471	Wrench, Torque
PWA 85537	Fixture, Handling
PWA 85585	Ring, Guide
PWA 85631	Guide, Piloting
PWA 85662	Bracket (Optional to PWA 85667)
PWA 85667	Bracket (2 Necessary)
PWA 85749	Adapter, Torque-Electrical Connector
PWA 86209	Retainer, Positioning (Optional to PWA 85537)
PWA 86567	Adapter, Lift and Trunnion (2 Necessary)
PWA 86598	Retainer, Positioning (Optional to PWA 86209)
PWA 88709	Plug
PWA 101848	Puller, Jackscrew (6 Necessary)

NOTE: Use PWA 86598 or PWA 86209 Retainer as an alternate to PWA 85537 Fixture if you will remove the HPC top front case with the procedure in Removal-18 (Task 72-00-35-030-001, Section 72-00-35).

C. Disconnect the EEC Wiring Harnesses (See Figure 302 and Figure 303.)

(1) Disconnect the W1 EEC wiring harness as follows:

(a) Use the PWA 85749 Torque Adapter and disconnect the W1P11 and the W1P10 harness connectors from the 1 o'clock position solenoid.

(b) Remove the clamp bolts and nuts that attach the harness to the Flange E bracket and to the solenoid muscle tube.

(c) Disconnect the W1P25 harness connector at the HPC case bracket at 1 o'clock position.

R ENGINE GENERAL − SPECIAL PROCEDURES−25

R (d) Use the PWA 85749 Torque Adapter and disconnect the W1P12 connector from the 10 o'clock position solenoid.

R (e) Disconnect the W1P24 harness connector at the HPC case bracket at 10 o'clock position.

R (f) Disconnect the W1P9 harness connector at the HPC case bracket at 11 o'clock position.

R (g) Remove the clamp bolts and nuts that attach the W1 harness to the HPC case brackets.

R (h) Temporarily attach the W1 harness to the 12 o'clock strut with lockwire. Keep the harness clear of Flange E.

R (i) Install protection covers.

R (2) Disconnect the W2 EEC wiring harness.

R (a) Disconnect the W2P26 harness connector at the HPC case bracket at the 1 o'clock position.

R (b) Remove the bolt that attaches the retaining bracket and the W2J9 receptacle to the HPC case bracket at 11 o'clock position.

R (c) Remove the clamp bolts that attach the W2 harness to the Flange E bracket and the No. 1., 1.5, and 2 bearing tubes.

R (d) Temporarily attach the W2 harness to the 12 o'clock strut with lockwire. Keep the harness clear of Flange E.

R (e) Install protection covers.

R (3) Remove the two bolts that attach the IDG heat exchanger valve harness and retaining bracket to the HPC case bracket. Remove the retaining bracket and disconnect the harness receptacle. Install a protection cover. Remove the two clamp bolts that attach the IDG harness to the hydraulic tube.

R (4) Use the PWA 85749 Torque Adapter and disconnect the W4P4 and the W5P11 harness connectors from the 5 o'clock position solenoid. Install protection covers.

(5) Remove the clamp bolt that attaches the W4 harness (to the EEC speed transducer) to the bleed valve supply tube at the 5 o'clock position.

(6) Disconnect the W3P15 harness connector from the 2.5 bleed valve actuator at 7 o'clock position. Install protection covers.

(7) Disconnect the W3P17 connector from the (engine) air/oil heat exchanger harness receptacle at 7:30 o'clock position. Remove the two bolts that attach the retaining bracket and receptacle from the HPC case bracket. Install a protection cover on the receptacle.

D. Disconnect The Tubes
(See Figure 304.)

(1) Remove the lockwire and disconnect the EEC PB sensing tubes (AS09, AS20) at 12:30 o'clock position. See Figure 304 (Sheet 1).

(2) For engines with PMUX or SCU, remove lockwire and disconnect the PT2.5 sensing tubes (AS29, AS30) at 12:30 o'clock position. See Figure 304 (Sheet 1).

(3) Remove lockwire and disconnect the HPC air valve supply and signal tubes (AA01, AA25) from the solenoid adapters at 1 o'clock position. See Figure 304 (Sheet 1).

(4) Remove lockwire and disconnect the two No. 3 bearing air cooler tubes (AP33, AP34) from the cooler at 2:30 o'clock position.

(5) Disconnect and remove the tubes from the IDG heat exchanger at 4 o'clock position as follows: (see Figure 304, Sheet 2)

(a) Remove the lockwire and disconnect the airframe (IDG) cooler outlet oil tube nut. Remove the three bolts that attach the tube to the heat exchanger. Remove the tube and discard the packing. Install the protection covers to the tube ends and port.

  - (b) Remove the lockwire and remove the (IDG) air/oil cooler valve hydraulic pressure and return tubes from the heat exchanger and the manifolds. Install the protective covers to the tubes, manifold tees, and the adapters.

- (6) Remove the lockwire and disconnect the compressor stator cylinder hydraulic pressure (CP12) and return tube (CR03) from the manifolds and cylinder as follows: (see Figure 304, Sheet 3)
  - (a) Remove the clamp bolts that attach the tubes to the Flange E bracket.
  - (b) Remove the tubes and install the protective covers to the tubes, manifold tees, and adapters.

- (7) Remove the hydraulic pressure (CP05) and oil cooler inlet return (CR01) manifolds as follows: (see Figure 304, Sheet 3)
  - (a) Remove the lockwire and disconnect the two hose nuts from the manifolds at 3 o'clock position.
  - (b) Remove the lockwire and disconnect the two manifolds at the lower tee connections at 5 o'clock position.
  - (c) Remove the clamp bolts and nut that attach the manifolds to the engine brackets. Remove the manifolds and install the protective covers to the hoses and to the manifold ends.

- (8) Remove the fuel distribution valve supply tube (FM09) as follows: (see Figure 304, Sheet 4)
  - (a) Remove the lockwire and disconnect each end.
  - (b) Remove the clamp bolts and nuts that attach the tube to the engine.
  - (c) Remove the tube and discard the packings.
  - (d) Install the protective cover.

- (9) Remove the three bleed valve supply tubes (AA26, AA27 and AA29) as follows: (see Figure 304, Sheet 5)

R (a) Remove the lockwire and disconnect the three tube connections at 2:30 o'clock position.

R (b) Remove the lockwire and disconnect the two tube connections to the 5 o'clock position solenoid. Remove the lockwire and disconnect the tube connection at the maintenance break adjacent to the solenoid. Remove the lockwire and disconnect the tube nut from the tee adjacent to the solenoid.

R (c) Remove the clamp bolts that attach the tubes to the engine brackets, to each other, and to the harness clamps.

R (d) Remove the tubes from the engine. Install the protective covers to all the tube ends and the solenoid adapters.

R (10) Remove the upper PT2.5 sensing tube assembly (AS30) as follows: (see Figure 304, Sheets 6, 7, and 8)

R (a) For engines not equipped with the supplemental control unit (SCU) with multiplexing, remove the lockwire from the cap assembly. Remove the cap assembly from the tube.

R (b) For engines equipped with the supplemental control unit (SCU) with multiplexing, remove the lockwire and disconnect the lower tube nut from the tube coupling tube (AS30) at approximately the 4 o'clock position rearward of Flange E.

R (c) Remove the bolts, clamps and a nut that attach the (AS30) tube to brackets on Flange E at the 1, 1:30, 2:30, and 3:30 o'clock positions.

R (d) Remove the tube from the engine and install protection covers.

R (11) For engines equipped with the supplemental control unit (SCU) with multiplexing, remove the lower PT2.5 sensing tube assembly (AS35)as follows:

R (a) Remove the bolts and clamps that attach the tube (AS35) to brackets on Flange E at the 4:30 and 5:00 o'clock positions.

(b) Remove the tube from the engine and install protection covers.

NOTE: The lower manifold (AS31) was removed before with the EEC speed transducer (N1) multiplexer input probe.

(12) Remove lockwire and disconnect the 2.5 bleed valve cylinder hydraulic pressure (CP02) and return (CR02) tubes from the cylinder and manifolds. See Figure 304(Sheet 9). Remove the tubes. Install protective covers to the tubes, adapters, and manifold tees.

(13) Remove the two bolts and disconnect the cooling air manifold (AC34) from the fan case boss at the 7 o'clock position. Remove the clamp bolt and tube.

(14) Remove the lockwire and disconnect the No. 1, 1.5, and 2 bearing oil scavenge tube (LR02) at 7:30 o'clock position. See Figure 304 (Sheet 10).

(15) Remove lockwire and disconnect each end of the left air/oil cooler hydraulic pressure (CP08) and return (CR08) tubes from the air/oil heat exchanger adapters at 8 o'clock position and manifolds. Remove the clamp bolt that attaches the pressure tube to the Flange E bracket. Remove the two tubes and install the protective closures.

(16) Remove the five bolts that attach the air/oil cooler inlet (LP02) oil tube to the main oil filter housing and the air/oil heat exchanger. See Figure 304 (Sheet 11). Remove the clamp bolt that attaches the tube to the HPC case bracket. Move the tube rearward and temporarily attach with lockwire. Discard the packings. Install the protection covers.

(17) Remove the two bolts that attach the air/oil cooler outlet hose and tube assembly (LP03) to the air/oil heat exchanger. Remove the lockwire and disconnect the tube nut from the fuel oil cooler bypass valve adapter. Remove the clamp bolts that attach the tube to the engine. Remove the tube and discard the packings. Install the protection covers.

R ENGINE GENERAL - SPECIAL PROCEDURES-25

R (18) Remove lockwire and disconnect the main bearing oil pressure tube (LP05) from the strainer housing at 9 o'clock position and the strainer housing at top of the fuel/oil cooler. See Figure 304 (Sheet 12). Remove the clamp bolts and remove the tube. Discard the packing and retainer. Remove the bolt and clamp that attaches the strainer housing to the Flange E bracket. Install protective covers.

R (19) Remove lockwire and disconnect the two signal tubes (AA06 and AA18) and the supply tube (AA22) from the solenoid adapters at 10 o'clock position.

R (20) Remove lockwire and disconnect the main bearing breather tube (LB06) at 11:30 o'clock position. See Figure 304 (Sheet 13).

R (21) Remove lockwire and disconnect the EEC PT4.95 tube (AS04) at 11:30 o'clock position.

R (22) If removal of the HPC top front case is necessary by Removal-18 (Task 72-00-35-430-001, Section 72-00-35), after the engine is split, remove the TCC air valve actuator at 2 o'clock position as follows: (see Figure 305)

R (a) Remove the nut and bolt that attach the cable rod end to the HPC TCC air shutoff valve idler arm.

R (b) Remove the lockwire and disconnect the cable coupling nut from the actuator.

R (c) Remove the bolt and ground strap from the actuator.

R (d) Remove the four bolts (and nuts, if equipped) that attach the actuator clamps to the bracket.

R NOTE: Do not remove the hoses from the actuator.

R (23) If removal of the HPC top front case is necessary by Removal-18 (Task 72-00-35-430-001, Section 72-00-35), after the engine is split, remove the stator vane actuator and support assembly as follows: (see Figure 306)

R (a) Remove the bolts that attach the fuel flowmeter support bracket to the support assembly. Remove the bracket.

(b) Remove the cotter pins, nuts, washers, and bolts that attach the four rod ends to the synchronizing rings. Disengage the rod ends. Install lockwire to the rod end bearings to attach them to the rod ends.

(c) Remove the cotter pins, nuts, bolts, studs, spacers, and shims that attach the support assembly to the HPC cases and brackets. Remove the stator vane actuator and support assembly.

E. Separate The Fan Unit From The Core Engine

(1) Install PWA 85585 Guide Ring on the No. 1.5 bearing support assembly as follows: (see Figure 307)

(a) Install PWA 85585 Guide Ring to the No. 1.5 bearing support assembly.

(b) Attach the ring with the detail screws.

CAUTION: DO NOT SUPPORT THE FRONT OF THE CORE UNIT BY THE GUIDE THAT YOU INSTALL ON THE FRONT OF THE CORE UNIT. DO NOT PUT ANY FORCE OR STRESS ON THE GUIDE. TOO MUCH STRESS ON THE GUIDE CAN CAUSE DAMAGE TO THE PLAIN ROUND NUT.

(2) Install PWA 85631 Guide as follows:

(a) Install the PWA 85631 Guide in the plain round nut. Be sure the threads engage correctly.

(b) Use PWA 85471 Wrench and tighten the PWA 85631 Guide until seated.

NOTE: If equipped, the four grooves on the PWA 85631 Guide (Change B) must be fully rearward of the PWA 85585 Guide Ring front surface. If the grooves are not fully rearward of the ring, the threads of the guide are not fully engaged.

(3) Install two PWA 86567 Adapters on the fan case at 3 and 9 o'clock positions. See Figure 308.

R ENGINE GENERAL - SPECIAL PROCEDURES-25

R (4) Attach PWA 25926 Adapters to two PWA 25757 Pedestals. Put the PWA 86567 Adapters that are on the fan case and the brackets that are on the intermediate case in the adapters on the pedestals. Install two PWA 25757 Pedestals and PWA 25926 Adapters to support the forward end of the fan case. See Figure 308.

R (5) Install PWA 85390 Lifting Adapter on the 8th stage bleed pads as follows:

R (a) Remove the two adapters. To remove the adapters, remove the pins.

R (b) Attach the adapters to the 8th stage bleed pads with the detail screws.

R (c) With a hoist, lift the arms of the tool.

R (d) Attach the arms to the adapters with the pins.

R (6) For these models: 4052-3, 4056-3, 4060-3, 4060A-3, 4060C-3, 4062-3 (Pre SB PW4ENG 72-562) Thread the PWA 85246 Plug onto the HPC rear hub at the center of the diffuser case. See Figure 308.

R (7) For these models: 4052-3, 4056-3, 4060-3, 4060A-3, 4060C-3, 4062-3 (Post SB PW4ENG 72-562) Thread the PWA 88709 Plug onto the HPC rear shaft at the center of the diffuser case. See Figure 308.

R (8) Use PWA 28657 Sling with two PWA 76156 Adapters attached to trunnion spools of PWA 85064 Fixture to position fixture over plug and onto diffuser case. Align dowel pin hole in case with fixture. Secure fixture to case with bolts.

R (9) Support the engine with:

R (a) Four PWA 25757 Pedestals, PWA 25926 Adapter and PWA 86567 Adapter and PWA 85667 Brackets at the fan unit.

R (b) The middle of the core engine: Use a hoist and PWA 85390 Adapter.

R (c) The rear of the core engine: Use a hoist, PWA 28657 Sling, PWA 76156 Adapters, and PWA 85064 Fixture.

(10) Remove the 33 bolts in the rear flange of the No. 1.5 bearing support assembly. See Figure 309.

NOTE: If removal of the HPC top front case is necessary by Removal-18 (Task 72-00-35-430-001, Section 72-00-35), use the PWA 86598 Retainer or PWA 86209 Retainer as an alternative to PWA 85537 Fixture. The retainer will permit removal of the top case.

CAUTION: FOR RETAINING BOLTS USE WORKBOLTS WITH DRILLED HEADS WITH A 0.500 INCH (12.700 MM) MAXIMUM SHANK AND THREAD LENGTH. (PART NUMBER MS9218-05 OR MS9218-06 IS RECOMMENDED.)

(11) Install four retaining bolts in the holes indicated in Figure 309. Tighten by hand. Tag the bolts "To Be Removed".

(12) Install four jacking bolts in the rear flange of the No. 1.5 bearing support assembly. Tighten by hand. See Figure 309. Tag the bolts "Jacking Bolts".

(13) Remove the 74 bolts that attach the HPC to the intermediate case at Flange E. Install two PWA 85260 Guide Pins at approximately 3 and 9 o'clock positions on Flange E. Install two PWA 29855-7 Aligning Pins at approximately 6 and 12 o'clock positions on Flange E. See Figure 310, Figure 311, and Figure 312.

(a) For engines with the 2.5 bleed actuator support bracket (post SB PW4ENG 75-84), remove the three bolts and nuts that attach the support bracket to a bracket on Flange E.

(14) Install six PWA 101848 Jackscrew Pullers as follows: (see Figure 312)

(a) Remove the two detail screws from one of the plates.

(b) Put the plate in the space between the intermediate case and the bosses of the HPC inlet synchronizing ring assemblies. Align the screw holes in the plate with the inserts in the intermediate case.

(c) Attach the plate to the intermediate case with the two screws.

R (d) Install the five other jackscrew plates in the same way. Make sure that the distances between the plates are equal.

R CAUTION: BE SURE THAT THE HOISTS HAVE THE CORRECT EQUAL TENSION TO PERMIT THE SEPARATION OF THE FAN UNIT FROM THE CORE ENGINE. TOO MUCH OR TOO LESS TENSION ON ANY OF THE HOISTS CAN CAUSE DAMAGE TO THE ENGINE.

R CAUTION: USE A FLASHLIGHT AND BE SURE THAT ALL 33 SUPPORT BOLTS AND ALL 74 FLANGE E BOLTS ARE REMOVED. COUNT THE BOLTS. BE SURE ALL EXTERNAL PARTS ARE DISCONNECTED AND ARE CLEAR FOR SEPARATION.

R (15) Move core engine away from fan unit.

R (a) Use the jackscrews in the No. 1.5 bearing support assembly and the jackscrew plates.

R (16) For engines that have incorporated SB PW4ENG 72−48, discard the packing on the intermediate case at Flange E. Remove the transfer tube (and packings, if equipped).

R (17) Remove the four bolts that are in the No. 1.5 bearing support assembly with the tag "Jacking Bolts".

R (18) Remove the two PWA 85260 Guide Pins and the two PWA 29855−7 Aligning Pins from Flange E.

R CAUTION: DO NOT SUPPORT THE FRONT OF THE CORE UNIT BY PWA 85631 GUIDE THAT IS INSTALLED ON THE FRONT OF THE CORE UNIT. DO NOT PUT ANY FORCE OR STRESS ON THE GUIDE. TOO MUCH STRESS ON THE GUIDE CAN CAUSE DAMAGE TO THE PLAIN ROUND NUT.

R (19) To install core unit in horizontal position perform the steps that follow:

R (a) Install PWA 85537 Fixture (optional to the installation of PWA 86598 Retainer or PWA 86209 Retainer) on the HPC. See Figure 313.

1 The No. 2 bearing support assembly has a locating pin at 6:00 o'clock. Put the locating pin in one of the holes of the inner bolt circle on the tool.

2 Attach the tool to the HPC with the detail screws, washers and nuts.

3 Attach the tool to the No. 2 bearing support assembly with the detail screws.

(b) Install PWA 86598 Retainer or PWA 86209 Retainer (optional to PWA 85537 Fixture) on the HPC. Use the detail bolts and nuts. See Figure 313.

(c) Attach PWA 25926 Adapters to four PWA 25757 Pedestals. Put the PWA 85537 Fixture that is on the HPC and the PWA 85064 Fixture that is on the diffuser in the adapters on the pedestals.

(d) Remove PWA 101848 Jackscrew Plates.

NOTE: Do not remove PWA 85390 Adapter from the core unit.

1 Attach PWA 25926 Adapters to four PWA 25757 Pedestals. Put the PWA 86567 Adapters that are on the fan case and the brackets that are on the intermediate case in the adapters on the pedestals.

2 Remove the PWA 76154 Adapters, sling, eye, and hoists from the fan unit.

(20) To install core unit in vertical position front end down position perform the steps that follow:

(a) Place PWA 85537 Fixture onto PWA 87022 Stand or PWA 85108 Stand.

(b) Trunnion the core unit front end down (use PWA 85390 Adapter and PWA 28657 Sling). Lower the core unit front end down onto PWA 85537 Fixture.

(c) Attach PWA 85537 Fixture to the HPC front flange and the No. 2 bearing support assembly with detail screws, washers and nuts.

R ENGINE GENERAL - SPECIAL PROCEDURES-25

R (d) Remove PWA 85390 Fixture and PWA 101848 Jackscrew
R Plates.

R NOTE: If there is a need to install the core unit
R rear end down, install hoist at PWA 85337
R Fixture and PWA 85064 Fixture. Lift the
R core unit and trunnion the core unit rear
R end down. Lower the core unit onto PWA
R 87022 Stand or PWA 85108 Stand.

R F. Postrequisites

R (1) If necessary, remove the HPC top front case. Refer to
R Removal-18 (Task 72-00-35-030-001, Section 72-00-35).

R (2) If necessary, remove the No. 3 bearing assembly.
R Refer to Removal-17 (Task 72-00-41-040-001, Section
R 72-00-41), core unit front end down.

R (3) If necessary, remove the No. 2 bearing assembly.
R Refer to Removal-01 (Task 72-00-35-020-001, Section
R 72-00-35), core unit rear end down.

R Task 72-00-00-020-005-002:

R 2. Install HPC/Diffuser Assembly To The Engine (Horizontal)

R A. Prerequisites

R (1) If disassembled, install the HPC top front case. Refer
R to Installation-18 (Task 72-00-35-430-001, Section
R 72-00-35).

R (2) If applicable, trunnion the fan unit from rear end down
R to horizontal position. Refer to Special Procedures-22
R (Task 72-00-00-420-004).

R B. Equipment And Materials Necessary

R NOTE: Refer to Task 72-00-00-020-005-001 in this document
R for all necessary tools.

R Removal Procedure Sequence
R Figure 301
R (Task 72-00-00-020-005-001)

ENGINE GENERAL - SPECIAL PROCEDURES-25

1. Remove Electronic Engine Control (EEC) Speed Transducer (N1)
2. Remove Compressor Inlet Cone
3. Remove LPC/LPT Coupling
4. Remove Main Gearbox
5. Remove Turbine Exhaust Case
6. Remove Low Pressure Turbine (LPT)
7. Remove High Pressure Turbine (HPT)
8. Remove Diffuser And High Pressure Compressor From Intermediate Case
9. Trunnion High Pressure Compressor Through Diffuser Case To Front End Down

Key to Figure 301

(1) The installation procedures are to be done in the reverse order of the removal procedure defined in Task 72-00-00-020-005-001 in this document. Be sure to use appropriate torques, measurements, support equipment, consumables and expendable materials specified in similar procedures in the engine manual Section 72-00-34.

D. Postrequisites

(1) Install the high pressure turbine by Installation-01 (Task 72-00-52-420-001, Section 72-00-52).

(2) Install the low pressure turbine with shaft by Installation-01 (Task 72-00-53-420-001, Section 72-00-53).

  (a) Optional: Install the low pressure turbine and turbine exhaust case with shaft (mechanical wrench or hydraulic wrench) by Installation-08 (Task 72-00-53-420-002, Section 72-00-53).

(3) Install turbine exhaust case by Installation-01 (Task 72-00-54-420-001, Section 72-00-54).

(4) Install main gearbox by Installation-01 (Task 72-00-61-420-001, Section 72-00-61).

(5) If necessary, install low pressure compressor by Installation-01 (Task 72-00-31-420-003, Section 72-00-31).

(6) Install LPC/LPT coupling with a mechanical wrench or hydraulic wrench by Installation-01 (Task 72-00-32-420-001, Section 72-00-32).

ENGINE GENERAL - REMOVAL-01

Task 72-00-00-050-001:

1. Remove No. 1, 1 1/2 And 2 Bearing Oil Pressure Strainer
   - A. Equipment And Materials Required - None
   - B. Procedure

     See Figure 301.
     - (1) Locate in line strainer on main bearing pressure manifold assembly on left side of engine protruding from intermediate case at appoximately 9 o'clock position.
     - (2) Remove lockwire securing strainer and remove strainer from manifold. Collect residual oil.
     - (3) Remove and discard packing.
     - (4) Install protective closures.
   - C. Postrequisites
     - (1) Clean and inspect strainer per Cleaning-01 (Task 72-00-00-110-001).

ENGINE GENERAL - REMOVAL-02

Task 72-00-00-050-002:

1. Remove Angle And Main Gearbox Strainer
   - A. Equipment And Materials Required

     Special Tools:
     PWA 85518 Puller

   - B. Procedure
     See Figure 301.
     - (1) Locate angle and main gearbox strainer on left side of engine in housing mounted on top of fuel oil cooler.
     - (2) Remove bolts securing strainer and remove strainer from housing using PWA 85518 Puller. Collect residual oil.
     - (3) Remove and discard packing.
     - (4) Install protective closures.
   - C. Postrequisites
     - (1) Clean and inspect strainer per Cleaning-01 (Task 72-00-00-110-001).

ENGINE GENERAL - REMOVAL-03

Task 72-00-00-050-003:

1. Remove No. 3 Bearing Oil Pressure Strainer (Pre SB PW4ENG 79-52)
   A. Equipment And Materials Required - None
   B. Procedure
      See Figure 301.
      (1) Locate in line strainer on No. 3 bearing oil pressure manifold on left side of engine, rearward of fuel oil cooler.

      CAUTION: YOU MUST USE THE WRENCHING FLATS ON THE STRAINER HOUSING WHEN YOU LOOSEN OR TIGHTEN THE STRAINER. THIS WILL PREVENT ANY TWIST DAMAGE TO THE TUBES.

      (2) Remove the lockwire from the strainer and the strainer housing. While you hold the strainer housing with a wrench, remove the strainer from the housing. Collect the oil.
      (3) Remove and discard packing.
      (4) Install protective closures.
   C. Postrequisites
      (1) Clean and inspect strainer per Cleaning-01 (Task 72-00-00-110-001).

Task 72-00-00-050-003-A:

2. Remove No. 3 Bearing Oil Pressure Strainer (Post SB PW4ENG 79-52)
   A. Equipment And Materials Required - None
   B. Procedure
      See Figure 302.
      (1) Remove the bolt from the clamp that attaches the No. 3 bearing oil pressure manifold (LP18) and spray shield to a bracket on the high compressor at approximately the 9 o'clock position. Remove the bolt, clamp and spray shield.
      (2) Remove the lockwire and disconnect the manifold nut (LP18) from the adapter in the No. 3 bearing oil pressure tube (LP19). Collect the oil.
      (3) Remove the bolts that attach the ferrule end of the tube (LP19) to a bracket on Flange K.
      (4) Remove the lockwire from the bolts that attach the adapter and a strainer into the ferrule end of tube (LP19). Remove the bolts and nuts from the adapter.
      (5) Remove a nut and bolt that attach clamps together on the oil trim pressure tube (LP32) and the No. 3 bearing oil pressure manifold (LP18). The clamps are located just above the fuel/oil cooler. The clamps can stay with the tube and manifold.

(Task 72-00-00-050-003)

CAUTION: YOU MUST USE THE FLATS ON THE MATING PARTS WHEN YOU LOOSEN MANIFOLDS AND TUBES. THIS WILL PREVENT ANY TWISTS DAMAGE TO THE TUBES.

(6) Remove the lockwire from the tube nuts on the oil trim pressure tube (LP31) and disconnect the tube nuts.
(7) Remove the lockwire from the tube nut on the No. 3 bearing oil pressure manifold (LP18) that is attached to the bearing strainer element housing on top of the fuel/oil cooler. Remove the retainer and packing and discard. Remove the oil trim pressure tube (LP31).
(8) With the No. 3 bearing oil pressure manifold loosened sufficiently, remove the adapter from the ferrule end of No. 3 bearing oil pressure tube (LP19). Remove the packing from the adapter.
(9) Remove the strainer from the ferrule end of tube (LP19).
(10) Install protective closures.

C. Postrequisites

(1) Inspect and clean strainer. See Cleaning−01 (Task 72−00−00−110−001).

ENGINE GENERAL - REMOVAL-04

Task 72-00-00-050-004:

1. Remove No. 4 Bearing Oil Pressure Strainer

A. Equipment And Materials Required - None

B. Procedure

See Figure 301.

(1) Remove lockwire securing strainer element to strainer housing at approximately 10:30 o'clock position on exhaust case.

(2) Remove strainer from housing. Collect residual oil.

(3) Remove and discard packing. Install protective closures.

C. Postrequisites

(1) Clean and inspect strainer per Cleaning-01 (Task 72-00-00-110-001).

ENGINE GENERAL - REMOVAL-05

Task 72-00-00-050-005:

1. Remove HPC Secondary Flow Control Filter Element

NOTE: Procedure for removal of filter elements from left and right side of engine is the same.

A. Equipment And Materials Required - None

B. Procedure

See Figure 301.

(1) Remove lockwire and unscrew case from head assembly.

(2) Unscrew filter element from head assembly.

(3) Install protective closure on head assembly.

(4) Inspect and clean filter element per 72-00-00, Cleaning-02 (Task 72-00-00-110-003).

Task 72-00-00-990-008:

1. Install Engine Wire Harnesses

See Figure 401 (Sheets 1 through 8).

A. General

(1) Procedures for installation of engine wire harnesses are located within appropriate engine sectionalization sections of the manual. Referenced figures provide specific location data for procedures related to each segment of wire harness.

Task 72-00-00-990-009:

2. General Installation Requirements For Electrical Harnesses, Leads And Cables

See Figures 402, 403 and 404.

NOTE: This procedure consists of general guidelines for the installation of electrical harnesses, leads and cables. For specific installation of a particular unit, see appropriate engine manual section.

A. Install harness, lead or cable assembly loosely on engine, making all end connections. See Figure 402 for typical installation.

NOTE: When modules or assembly groups are being removed or installed on the engine, certain requirements, such as initially connecting both ends of harness or cable, or locating mid-point of harness, may not be applicable. In such instances, adhere to the remaining general installation requirements.

To allow for variances in harness diameter, it is permissible to select alternate clamp sizes, larger or smaller, to secure electrical harnesses and to prevent harness slipping and/or rotation. See Illustrated Parts Catalog for applicable clamp sizes.

(1) Connect the harness connectors to the harness receptacles as follows. For each connector:

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol (P11-009). Let dry.

EEC Fan Case Wiring Harnesses (W1) And (W2)
Figure 401 (Sheet 1)
(Task 72−00−00−990−008)

1. EEC Fan Case Wiring Harness (W1), See 72−00−33, Installation−06.
2. EEC Fan Case Wiring Harness (W2), See 72−00−33, Installation−06.

Key To Figure 401 (Sheet 1)

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the (Glenair TG−70) strap wrench or the (Glenair TG−69) soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).

This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

See the instructions given with the strap wrench for correct use.

(2) Locate mid−point or control point of harness at a position where harness is clamped to a fixed bracket. Attach a clamp with proper hardware and torque.

(3) From established control point, attach clamps loosely in both directions, ensuring that slack is equal between all clamps and no mechanical strain is imposed on wires, junctions, supports or connections. Care must be taken to avoid sharp bends at clamps, supports and connector backshells.

EEC Fan Case Wiring Harnesses (W1) And (W2)
And EEC Core Engine Wiring Harnesses (W3) And (W5)
Figure 401 (Sheet 2)
(Task 72−00−00−990−008)

1. EEC Fan Case Wiring Harness (W1), See 72−00−33, Installation−06.
2. EEC Fan Case Wiring Harness (W2), See 72−00−33, Installation−06.
3. EEC Core Engine Wiring Harness (W3), See 72−00−34, Installation−18.
4. EEC Core Engine Wiring Harness (W5), See 72−00−34, Installation−20.

Key To Figure 401 (Sheet 2)

(4) Where wiring is dressed downward to a connector, terminal block, panel or junction box a trap or drip loop shall be provided to prevent fluids or condensate from running into these devices. See Figure 403. Waterproof connections and backshells are exempt from this requirement. Allow sufficient slack for removal and installation of connectors and to permit free movement of shock and vibration isolater mounted equipment.

B. After all harness, lead or cable attachments are in place, tighten clamp hardware with proper torque.

(1) Clamps must be at 90 degree to the harness, lead or cable (see Figure 402) and must not slip, rotate, or have cushion material between the clamp ends.

(2) Make certain that all wires within the open bundle harness are within the cushion portion of the clamp and none are caught or trapped in the metal parts of the clamp. See Figure 404.

(3) Tie wire groups and bundles together at intervals not greater than two inches (50.80 mm). Bundles shall have a neat and orderly appearance with no foldbacks or loops outside the bundle. Individual wires should be essentially parallel within the bundle with a minimum of tangling except where twisted groups may be required.

(4) All clamp bolts and nuts must be tightened to recommended standard torque values without distorting the clamp cushion material.

(5) Chafing must be prevented by proper routing and clamping to prevent contact with edges of equipment or structure. Maintain 0.125 inch (3.175 mm) minimum clearance with adjacent part when harness, lead or cable is deflected or pushed.

ENGINE GENERAL - INSTALLATION-01

Task 72-00-00-450-001:

1. Install No. 1, 1 1/2 And 2 Bearing Oil Pressure Strainer

A. Equipment And Materials Required

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Material:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Packing	1	79-21-00	11	150

B. Procedure
See Figure 401.
(1) Remove protective closures.
(2) Lubricate packing with Engine Oil (P03-001) and install packing onto strainer.
(3) Lubricate threads of strainer with Engine Oil (P03-001) and install strainer to housing on main bearing pressure manifold assembly. Torque strainer to 275 - 300 lb-in. (31.071 - 33.895 N.m). Install the Lockwire (P05-289) or Safety Cable (P05-291) and Safety Cable Ferrule (P05-292).

C. Postrequisites
(1) Test engine per Repair Test Reference Table. See 71-00-00, Testing-00 (Task 71-00-00-990-003).

ENGINE GENERAL - INSTALLATION-02

Task 72-00-00-450-002:

1. Install Angle And Main Gearbox Strainer

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Packing	1	79-21-00	6	90

B. Procedure

See Figure 401.

(1) Remove protective closures.

(2) Lubricate packing with Engine Oil (P03-001) and install packing to groove at base of strainer.

(3) Install strainer to main bearing strainer element housing assembly located on top of fuel oil cooler at approximately 9 o'clock position. Secure in place with bolts, lubricated with Engine Oil (P03-001). Torque bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

C. Postrequisites

(1) Test engine per Test Reference Table. See 71-00-00, Testing-00 (Task 71-00-00-990-003).

Task 72-00-00-450-003:

1. Install No. 3 Bearing Oil Pressure Strainer (Pre SB PW4ENG 79-52)

A. Equipment And Materials Required

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	79-21-00/10/130

B. Procedure
See Figure 401.

(1) Remove protective closures.

(2) Lubricate packing with Engine Oil P03-001, and install packing onto strainer.

CAUTION: YOU MUST USE THE WRENCHING FLATS ON THE STRAINER HOUSING WHEN YOU LOOSEN OR TIGHTEN THE STRAINER. THIS WILL PREVENT ANY TWIST DAMAGE TO THE TUBES.

(3) Lubricate the threads of the strainer with Engine Oil P03-001. Install the strainer to the No. 3 bearing oil strainer housing and tighten by hand. While you hold the stainer housing with a wrench, torque the strainer to 275 - 300 lb-in. (31.071 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

C. Postrequisites

(1) Test engine per Test Reference Table. See 71-00-00, Testing-00 (Task 71-00-00-990-003). R

Task 72-00-00-450-003-A:

2. Install No. 3 Bearing Oil Pressure Strainer (Post SB PW4ENG 79-52)

A. Equipment And Materials Required

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P06-021	Antigallant Compound (PWA 550-3)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	79-21-00/9/110
Retainer	1	79-21-00/9/120
Packing, AS3209-014		

B. Procedure
See Figure 402 and Figure 403.

(1) Remove protective closures.

(2) Install the strainer to the ferrule end of the No. 3 bearing oil pressure tube (LP19).

(3) Install a packing, lubricated with Engine Oil P03-001, to the adapter. Install the adapter to the ferrule end of the No. 3 bearing oil pressure tube (LP19). Attach the adapter to the tube with bolts, threads lubricated with Engine Oil P03-001, and nuts.

PW V

No. 3 Bearing Oil Pressure Strainer
Figure 401
(Task 72-00-00-450-003)

ENGINE GENERAL - INSTALLATION-03

(4) Torque the nuts that attach the adapter to the ferrule end of the tube (LP19) to 36 - 40 lb-in. (4.067 - 4.519 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to the bolts.

(5) Install the oil pressure trim tube assembly (LP31) as follows.

  (a) Lubricate the tube nuts with Antigallant Compound P06-021.

  (b) Install the trim tube to the oil metering nipple (restrictor). Tighten the tube nut by hand.

(6) Connect the manifold nuts on the No. 3 bearing oil pressure manifold (LP18) as follows.

  (a) Lubricate the manifold nut threads and manifold ferrules with Antigallant Compound P06-021. See Figure 403.

  (b) Lubricate a packing with Engine Oil P03-001 and install the packing and retainer to the front of the manifold.

  (c) Connect the front manifold nut to the rear of the strainer housing on the fuel/oil cooler. Tighten the manifold nut by hand.

  (d) Tighten the nut on the oil pressure trim tube (LP31) to the manifold tee (LP18) by hand.

  (e) Connect the rear manifold nut (LP18) to the adapter in the No. 3 bearing oil pressure tube (LP19) located at the 9 o'clock position. Tighten the manifold nut by hand.

(7) Attach the ferrule end of the No. 3 bearing oil pressure tube (LP19) to the bracket on Flange K with two bolts, threads lubricated with Engine Oil P03-001. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(8) (Reference 2016) Adjust the forward tube clamp on the oil trim pressure tube (LP32) and the clamp on the No. 3 bearing oil pressure manifold (LP18) so that center of the forward clamp (on the oil trim pressure tube) is 2.500 - 3.000 inch (63.500 - 76.200 mm) from the center of the rear clamp (Post SB PW4ENG 72-211).

(9) Attach the clamps together with a bolt, threads lubricated with Engine Oil P03-001, and a nut. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

CAUTION: YOU MUST USE THE FLATS ON THE MATING PARTS WHEN YOU TIGHTEN MANIFOLDS AND TUBES. THIS WILL PREVENT ANY TWISTS DAMAGE TO THE TUBES.

(10) Torque the manifold nuts on the No. 3 bearing oil pressure manifold (LP18) as follows.

(a) Torque the front manifold nut that is attached to the strainer housing on the fuel/oil cooler to 140 - 160 lb-in. (15.818 - 18.078 N.m), then loosen and torque again to the same value.

(b) Torque the rear manifold nut to the adapter in the No. 3 bearing oil pressure tube (LP19) to 675 - 750 lb-in. (76.265 - 84.739 N.m).

(c) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to the manifold nuts.

(11) Torque the tube nuts on oil trim pressure tube (LP31) as follows.

(a) Torque the front tube nut that is attached to the manifold tee (LP18) to 675 - 750 lb-in. (76.265 - 84.739 N.m).

(b) Torque the tube nut that is attached to the oil tube metering nipple (restrictor) to 675 - 750 lb-in. (76.265 - 84739 N.m).

(c) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to the tube nuts.

(12) At the rear of the No. 3 bearing oil pressure manifold (LP18), install a spray shield to the inboard side of the manifold. Attach the spray shield with a clamp and a bolt, threads lubricated with Engine Oil P03−001, to a bracket that is attached to the flange of the cooling air tube on the high compressor. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

C. Postrequisites

ENGINE GENERAL - INSTALLATION-04

Task 72-00-00-450-004:

1. Install No. 4 Bearing Oil Pressure Strainer
   A. Equipment And Materials Required

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Packing	1	79-21-00	12	190

   B. Procedure
      See Figure 401.
      (1) Remove protective closures and install new packing lubricated with Engine Oil (P03-001) to strainer element.
      (2) Install strainer element, threads lubricated with Engine Oil (P03-001), to strainer housing at approximately 10:30 o'clock position on exhaust case.
      (3) Torque strainer element to 150 - 170 lb-in. (16.948 - 19.207 N.m). Install the Lockwire (P05-289) or Safety Cable (P05-291) and Safety Cable Ferrule (P05-292).
   C. Postrequisites
      (1) Test engine per Test Reference Table. See 71-00-00, Testing-00 (Task 71-00-00-990-003).

ENGINE GENERAL - INSTALLATION-05

Task 72-00-00-450-005:

1. Install HPC Secondary Flow Control Filter Element

NOTE: Procedure for installation of filter elements on left and right side of engine is the same.

A. Equipment And Materials Necessary

Consumable Materials:

Item No.	Designation
P05-262	Lockwire, (MS20995C32)
P05-289	Lockwire

B. Procedure
See Figure 401.

(1) Remove protective closure from head assembly.

(2) Screw filter element into head assembly. Tighten filter element handtight.

(3) Install the case and tighten to a torque of 240 - 300 lb-in. (27.116 - 33.895 N.m).

(4) Safety the case to the head assembly with Lockwire P05-262 or Lockwire P05-289.

C. Postrequisites

(1) Test engine per Test Reference Table. See 71-00-00, Testing-00 Task 71-00-00-990-003.

ENGINE GENERAL − CLEANING−00

Task 72−00−00−990−002:

1. Cleaning

A. Clean Engine Exterior

(1) Remove grease, oil and/or dirt from engine exterior as necessary. Refer to SPOP 1 (Task 70−21−00−110−047).

B. General Cleaning

(1) As soon as the engine has been completely disassembled, clean all engine parts thoroughly to prepare them for adequate and thorough inspection.

CAUTION: TITANIUM WELDMENTS AND ASSEMBLIES SHOULD NOT BE PROCESSED THROUGH TRICHLORETHYLENE DEGREASERS OR ANY CLEANER CONTAINING CHLORIDES IN ORDER TO AVOID POSSIBILITY OF STRESS CORROSION ASSOCIATED WITH ENTRAPMENT OF CHLORINE CONTAINING MATERIALS IN TIGHT FITTING AREAS. THIS RESTRICTION ALSO APPLIES TO PARTS SUCH AS TITANIUM DISKS OR HUBS CONTAINING INSERTS, SLEEVES, OR PINS. DISKS MUST BE DEBLADED PRIOR TO CLEANING AND PRIOR TO FLUORESCENT PENETRANT OR MAGNETIC PARTICLE INSPECTION.

(2) See Standard Practices Manual for general cleaning procedures.

(3) Blind Holes

(a) To avoid the possibility of damage due to the hydraulic action of residual oil, grease, preservative compound, or other liquids, make sure that all holes into which studs, bolts, inserts, screw bushings, etc., will be driven are thoroughly clean.

(4) Face−Type Oil Seals

(a) See Standard Practices Manual for handling recommendations.

(5) Process Indexes

CAUTION: REMOVE OR PROTECT PRE−PACKED BEARINGS WHEN CLEANING ASSEMBLY CONTAINING BEARINGS.

CAUTION: IN ORDER TO AVOID THE POSSIBILITY OF STRESS CORROSION ASSOCIATED WITH THE ENTRAPMENT OF MATERIALS CONTAINING CHLORINE IN TIGHT FITTING AREAS, TITANIUM ALLOW WELDMENTS AND ASSEMBLIES MUST NOT BE PROCESSED THROUGH VAPOR DEGREASERS. THIS RESTRICTION ALSO APPLIES TO PARTS SUCH AS TITANIUM DISKS OR HUBS CONTAINING INSERTS, SLEEVES, OR PINS.

CAUTION: WHEN CLEANING PARTS MANUFACTURED, OR PREVIOUSLY REPAIR, WITH A METAL COATING, OR CHROMIUM PLATING, REFER TO SECTION 70−20 IN STANDARD PRACTICES MANUAL. CERTAIN CLEANING SOLUTIONS AND METAL COATINGS ARE INCOMPATIBLE AND THEIR USE TOGETHER WILL RESULT IN CORROSION ATTACK OF THE METAL COATING, OR CHROMIUM PLATING.

(a) The indexed parts in the various cleaning sections require carefully controlled chemical baths and water rinses, or other regulated processes to obtain various degrees of cleanliness. Each part is keyed to one, or more, cleaning processes by Service Process Operation Procedure (SPOP) numbers. Where more than one cleaning process number appears for the part name, any of the processes may be used as desired.

NOTE: A large percentage of parts can be cleaned satisfactorily for inspection by SPOP 209 (Task 70−21−00−110−041) Degreasing Of Parts By Aqueous Cleaning.

Previous Pageblock Return to Previous Menu Next Pageblock

ENGINE GENERAL - CLEANING-01

Task 72-00-00-110-001:

1. Clean Last Chance Oil Pressure Strainers
   A. Prerequisites
      (1) Remove No. 1, 1 1/2, and 2 bearing oil pressure strainer. See 72-00-00, Removal-01 (Task 72-00-00-050-001).
      (2) Remove angle and main gearbox oil strainer. See 72-00-00, Removal-02 (Task 72-00-00-050-002).
      (3) Remove No. 3 bearing oil pressure strainer. See 72-00-00, Removal-03 (Task 72-00-00-050-003).
      (4) Remove No. 4 bearing oil pressure strainer. See 72-00-00, Removal-04 (Task 72-00-00-050-004).
   B. Equipment And Materials Required

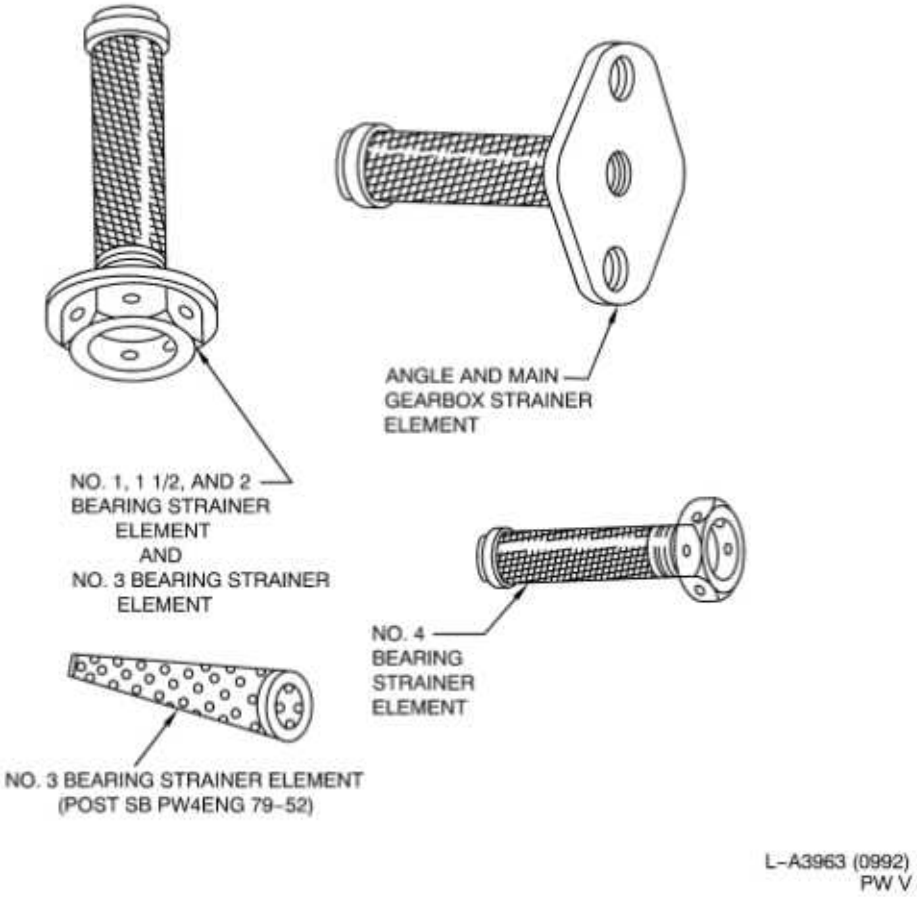
Consumable Materials:

Item No.	Designation
P05-026	Brush, Nylon
P11-004	Solvent, Cleaning (PMC 9010)

   C. Procedure
      See Figure 601.
      (1) Check for metal particle contamination by brushing strainer elements with Nylon Brush (P05-026) or equivalent and Cleaning Solvent (P11-004). Collect cleaning solvent in suitable container and filter through paint strainer or equivalent for metal particle indications.

NOTE: Strainer elements can also be degreased by SPOP 209 (Task 70-21-00-110-041) Degreasing Of Parts By Aqueous Cleaning.

      (2) Ensure strainer elements are clean and free of any foreign material.
      (3) Dry strainer elements with dry, filtered compressed air.
   D. Postrequisites
      (1) Install No. 4 bearing oil pressure strainer. See 72-00-00, Installation-04 (Task 72-00-00-450-004).
      (2) Install No. 3 bearing oil pressure strainer. See 72-00-00, Installation-03 (Task 72-00-00-450-003).
      (3) Install angle and main gearbox oil strainer. See 72-00-00, Installation-02 (Task 72-00-00-450-002).
      (4) Install No. 1, 1 1/2, and 2 bearing oil pressure strainer. See 72-00-00, Installation-01 (Task 72-00-00-450-001).



ANGLE AND MAIN GEARBOX STRAINER ELEMENT

Figure 601
(Task 72−00−00−110−001)

ENGINE GENERAL - CLEANING-02

Task 72-00-00-110-003:

1. Clean HPC Secondary Flow Control Filter Element

A. Prerequisites

(1) Remove HPC secondary flow control filter element. See 72-00-00, Removal-05 (Task 72-00-00-050-005).

B. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P05-005	Cloth, Lint-Free
P05-058	Brush, Stiff Bristle, Non-Metallic
P11-004	Solvent, Cleaning (PMC 9010)

C. Procedure

See Figure 601.

(1) Inspect filter element for evidence of an accumulation of contamination.

(2) Clean filter element with Cleaning Solvent (P11-004). Use a non-metallic, Stiff Bristle Brush (P05-058) to remove stubborn accumulations of contamination.

(3) Dry filter element with clean, Lint-Free Cloth (P05-005) or filtered, moisture free compressed air at 20 psig (138 kPa) maximum.

(4) Repeat cleaning procedure if any contaminants remain in filter element.

(5) If filter element remains contaminated after repeated cleaning, replace filter element.

D. Postrequisites

(1) Install HPC secondary flow control filter element. See 72-00-00, Installation-05 (Task 72-00-00-450-005).

(Task 72-00-00-110-003)

ENGINE GENERAL - CLEANING-03

Task 72-00-00-110-004:

1. Clean Engine Gaspath (Water Wash With Or Without Cleaning Solution) For Performance Improvement (Hose Method)

R CAUTION: REFER TO SPOP 425 (TASK 70-00-00-160-001) FOR ENGINES THAT HAVE BEEN EXPOSED TO FIRE EXTINGUISHING AGENTS, HYDRAULIC FLUID, OIL OR FUEL.

NOTE: The hose method is the least effective method for cleaning the core engine gaspath as most of the water exits through the fan exhaust air ducts. See Paragraph 2. for alternate cleaning method.

A. Equipment And Materials Required

(1) Hoses and nozzles to provide water flow capacity of approximately 160 U.S. gallons/minute (605.67 liters/minute). Experience has shown that two 7/8 inch (22.225 mm) nozzles with appropriate size hoses and city water supply pressure will provide this flow.

(2) Potable water (Refer to 70-20-00, General-01 (Task 70-20-00-100-001-003) Standard Practices Manual, PN 585005) source at pressure of 50 - 100 psi (144.7 - 689.50 kPa). Use existing potable water from tap or substitute suitable tank and pump.

(3) Shop air or nitrogen gas.

(4) The following Special Tools (PWA carts available in four options) may be used in place of the above equipment.

Special Tools:

PWA 86516	Basic Cart With Gasoline Powered Pump
PWA 86517	Basic Cart With Electric Powered Pump
PWA 86527	Basic Cart With Gasoline Powered Pump And Nitrogen Supply System
PWA 86528	Basic Cart With Electric Powered Pump And Nitrogen Supply System

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-005	Cloth, Lint Free Cotton
P05-022	Pad, Scotch Brite
P05-068	Gas, Nitrogen (PMC 2214)
P05-099	Tape, Moisture Resistant (PMC 4141)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P06-054	Antiseize, Paste (PWA 36246)
P11-014	Alcohol, Isopropyl (PMC 9094)
P11-049	Cleaner, Wipe (SPMC 148)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	75-37-00/1/20
Gasket	1	75-37-00/1/30

B. Procedure

NOTE: The use of a gaspath cleaning solution is based on each operator's previous experience and condition of each engine to be washed.

CAUTION: TO PREVENT FORMATION OF ICE, WATER WASHING SHOULD NOT BE PERFORMED WHEN AMBIENT TEMPERATURE IS 40°F (4.4°C) OR BELOW UNLESS YOU ADD ISOPROPYL ALCOHOL TO THE WATER.

(1) For an optional water wash with cleaning solution, prepare 30 gallons (113.56 liters) of SPS 87 Gaspath /Compressor Solution. Refer to 70-22-00, Solutions-02 (Task 70-22-00-980-002-087) Standard Practices Manual, PN 585005 for the make-up of this solution.

(a) The solution must be completely mixed and you must start the water wash within one hour after you mix the solution.

(2) Under freezing temperature conditions, it is permissible to add sufficient Isopropyl Alcohol P11-014 to water. At freezing temperature and below, caution should be exercised during water washing to ensure no ice has formed that could cause damage to the engine. Table 601 recommends minimum water-alcohol mixture. However, a maximum mixture of 50 percent alcohol may be used.

Percent Alcohol By Volume	Outside Air Temperature (OAT)
3	40°F (4.4°C)
6	38°F (3.3°C)
9	36°F (2.2°C)
14	33°F (0.6°C)
17	31°F (-0.6°C)
20	28°F (-2.2°C)
22	26°F (-3.3°C)
23	25°F (-3.9°C)
27	20°F (-6.6°C)
32	15°F (-9.4°C)
36	10°F (-12.2°C)
39	5°F (-15°C)
43	0°F (-17.8°C)

Minimum Required Alcohol/Water Mixtures
Table 601

(3) Remove, plug and/or cap the following tubes, manifolds or components. See Figure 601, Figure 602, Figure 603, Figure 604, Figure 605, Figure 606 and Figure 607.

(a) Remove lockwire and disconnect HPC air valve signal tubes (left and right) from adapters on HPC secondary flow control valves located at approximately 3:30 and 9:30 o'clock positions. Plug tubes and supply shop air or Nitrogen Gas P05-068 at 50 psi (344.7 kPa) to valve adapters to maintain valves in closed position. See Figure 601 and Figure 602.

(b) Remove lockwire and disconnect air shutoff valve signal tubes (left and right) from adapters on turbine vane and blade cooling air valves located at approximately 3 and 10 o'clock positions. Plug tubes and supply shop air or Nitrogen Gas P05-068 at 50 psi (344.7 kPa) to valve adapters to maintain valves in closed position. See Figure 601 and Figure 603.

(c) Remove lockwire and disconnect EEC PT4.95 manifold at approximately 6 o'clock position adjacent to Flange P. Install plug and cap to tube and manifold. See Figure 601 and Figure 605.

(d) Remove lockwire and disconnect HPC air valve and air shutoff valve supply tube from diffuser case adapter at approximately 12:30 o'clock position. Remove clamp bolt and nut securing tube to Flange K bracket to disengage tube from adapter. Install plug to tube and cap to adapter. See Figure 601 and Figure 606.

(e) Remove lockwire and disconnect EEC PB tube from diffuser case adapter at approximately 1:30 o'clock position. Remove clamp bolt and nut securing tube to Flange K bracket to disengage tube from adapter. Install plug to tube and cap to adapter. See Figure 601 and Figure 606.

(f) Remove lockwire and disconnect HPC air valve and bleed valve supply tube from diffuser case at approximately 2 o'clock position. Disengage tube from adapter and install plug to tube and cap to adapter. See Figure 601 and Figure 606.

(g) For engines equipped with engine propulsion multiplexer unit (PMUX), remove lockwire and disconnect PT2.5 sensing manifold from probe adapter located in intermediate case at approximately 5 o'clock position. Remove clamp bolt securing tube to Flange E bracket to disengage tube from adapter. Install plug to tube and cap to adapter. See Figure 607.

(h) Cover all openings on PT2/TT2 probe located in inlet cowl with Moisture Resistant Tape P05-099.

(4) Top off engine oil tank. See 72-00-00, Servicing-03 Task 72-00-00-610-003.

(5) Null ignition system.

WARNING: IN FOLLOWING WATER SPRAY PROCEDURE, IF HOSE IS HAND HELD, OPERATOR MUST STAND AT LEAST FIVE FEET FROM ENGINE INLET.

CAUTION: DO NOT INTRODUCE WATER INTO GASPATH IF EGT IS ABOVE 150°F (66°C). IF YOU START THE WATER FLOW WITH THE EGT ABOVE 150°F (66°C) THE WATER WILL EVAPORATE FROM THE HOT SURFACES AND WILL NOT EFFECTIVELY CLEAN THE SURFACES.

(6) Motor the engine with the starter until 18 − 22 percent N2 is reached. Keep the N2 in this range during the washing and the rinsing.

NOTE: The engine RPM will decrease as water is flowed into the gaspath.

(7) If water only is used, spray at fan blade roots at engine top dead center at 50 psig (344.7 kPa) minimum followed by 20 minutes of soaking. Repeat cycle three times.

NOTE: If the flow rate and supply pressure specified in steps (7) and (8) are not available, use the pressure and flow rate you have. If the engine has been satisfactorily cleaned, the water leaving the tail pipe will be clear. If water is not clear, repeat cleaning cycle as necessary.

NOTE: If water flow from the tailpipe is dirty, benefit can be increased if you do the wash procedure again. The operator can do the wash procedure again at their discretion.

(8) If cleaning solution is used, spray 30 gallons (113.56 liters) of solution at fan blade roots at engine top dead center at 50 psig (344.7 kPa) minimum followed by 20 minutes of soaking. Repeat cycle three times. Rinse engine by spraying clean water in same manner followed by 10 minutes of soaking. Repeat rinse again.

(9) Examine the LPC 1st stage (fan) blades, fairing, fan exit guide vanes and 1.6 stage blades for any damage from the cleaning procedure.

(10) Hand wash LPC 1st stage (fan) blades by one of the methods that follow:

(a) Make a clean Lint Free Cotton Cloth (P05−005) or fine or medium Scotch Brite Pad (P05−252) moist with SPS 87 Gaspath Cleaner Solution. Wipe both sides of the fan blades (as possible) until clean. See Section 70−22−00, Solutions−02 in the Standard Practices Manual, PN 585005, for SPS 87 make−up. Rinse the blades thoroughly with clean water.

(b) Wipe the blades with SPMC 148 Wipe Cleaner (P11−049) on a clean cloth. A tampico or nylon brush may be used to scrub the fan blades. Wipe off with a clean cloth. Rinse is not necessary.

(11) Hand wash the Stage 1 LPC stator vanes with SPMC 148 Wipe Cleaner (P11−049) on a clean cloth. A tampico or nylon brush may be used to scrub LPC stator vanes. Wipe off with a clean cloth. Rinse is not necessary.

(12) Upon completion of wash remove all caps and plugs on all previously disconnected tube assemblies, components, and probes. Allow any water to drain.

CAUTION: USE OF LUBRICANTS ON EEC OR PMUX SENSING TUBES, ADAPTERS, OR PACKINGS COULD RESULT IN CONTAMINATION OF EEC OR PMUX.

(13) Reconnect previously disconnected tubes, manifolds and components as follows:

(a) For engines equipped with engine propulsion multiplexer (PMUX), connect PT2.5 sensing manifold to probe adapter in intermediate case at approximately 5 o'clock position. Install clamp and bolt, threads lubricated with Engine Oil P03−001, securing tube to Flange E bracket. Torque bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). Torque manifold nut to probe adapter to 135 − 150 lb−in. (15.253 − 16.948 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292. See Figure 607.

(b) Connect HPC air valve and bleed valve supply tube to diffuser case adapter, threads lubricated with Antiseize Paste P06-054, at approximately 2 o'clock position on diffuser case. Torque tube nut to 200 - 225 lb-in. (22.597 - 25.422 N.m). Wipe off excess paste. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292. See Figure 601 and Figure 606.

(c) Connect EEC PB tube to adapter at approximately 1:30 o'clock position on diffuser case handtight only. Install clamps, bolt, threads lubricated with Engine Oil P03-001, and nut securing two tubes to Flange K bracket. Torque bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m). Torque tube nut to adapter 270 - 300 lb-in. (30.506 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292. See See Figure 601 and Figure 606.

(d) Connect HPC air valve and air shutoff valve supply tube to adapter, threads lubricated with Antiseize Paste P06-054, at approximately 12:30 o'clock position on diffuser case handtight only. Wipe off excess paste. Install clamp, bolt, threads lubricated with Engine Oil P03-001, and nut securing tube to Flange K bracket. Torque bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m). Torque tube nut to adapter to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292. See Figure 601 and Figure 606.

(e) Connect EEC PT4.95 tube to manifold tee at approximately 6 o'clock position adjacent to Flange P. Torque tube nut to 270 - 300 lb-in. (30.506 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292. See Figure 601 and Figure 605.

(f) Disconnect shop air from turbine blade and vane cooling air valves located at approximately 3 and 10 o'clock positions between Flanges J and K. Connect air shutoff valve signal tubes (left and right) to valve adapters, threads lubricated with Antiseize Paste P06-054. Torque tube nuts to 200 - 225 lb-in. (22.597 - 25.422 N.m). Wipe off excess paste. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292. See Figure 601 and Figure 603.

(g) Disconnect shop air from HPC secondary flow control valve adapters located forward of Flange J at approximately 3:30 and 9:30 o'clock positions. Connect HPC air valve signal tubes (left and right) to valve adapters, threads lubricated with Antiseize Paste P06-054. Torque tube nuts to 200 - 225 lb-in. (22.597 - 25.422 N.m). Wipe off excess paste. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292. See Figure 601 and Figure 602.

(h) Remove tape from PT2/TT2 probe located in inlet cowl.

(14) Reset nulled ignition system.

(15) Test the engine. See 71-00-00, Testing-03 Task 71-00-00-760-030.

NOTE: Be sure to run engine at Minimum Idle until the main oil temperature reaches or exceeds 220°F (104.4°C) for a minimum of two minutes.

C. Postrequisites

(1) Inspect PB, PT4.95, PAMB, and PT2 water traps. See 72-00-33, Inspection/Check-02 Task 72-00-33-210-001.

Task 72-00-00-110-004-A:

2. Clean Engine Gaspath (Water Wash With Or Without Cleaning Solution) For Performance Improvement (Hook Method)

R CAUTION: REFER TO SPOP 425 (TASK 70-00-00-160-001) IN THE STANDARD PRACTICES MANUAL, PN 585005 FOR ENGINES THAT HAVE BEEN EXPOSED TO FIRE EXTINGUISHING AGENTS, HYDRAULIC FLUID, OIL OR FUEL.

(1) Hoses and nozzles to provide water flow capacity of approximately 160 U.S. gallons/minute (605.67 liters/minute). Experience has shown that two 7/8 inch (22.225 mm) nozzles with appropriate size hoses and city water supply pressure will provide this flow.

(2) Potable water (Refer to 70-20-00, General-01 (Task 70-20-00-100-001-003) Standard Practices Manual, PN 585005) source at 7.5 Gal/Min (28 liters/Min) with PWA 101041 Wash Nozzles. Use existing potable water from tap or substitute suitable tank and pump.

(3) Shop air or nitrogen gas.

(4) The following Special Tools (PWA carts available in four options) may be used in place of the above equipment.

Special Tools:

PWA 83298	Valve (with necessary hoses to give 15 US gallons (57 liters) per minute flow)
PWA 86516	Basic cart with gasoline powered pump
PWA 86517	Basic cart with electric powered pump
PWA 86527	Basic cart with gasoline powered pump and nitrogen supply system
PWA 86528	Basic cart with electric powered pump and nitrogen supply system
PWA 101041	Water Wash Nozzle (2 Necessary)

NOTE: Experience has shown that local water supply pressure will give enough flow. You must use one of the optional carts if:
- You use a cleaning solution or
- You use alcohol for antifreeze or
- There is no clean tap water source at the wash site.

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P05-005	Cloth, Lint Free Cotton
P05-022	Pad, Scotch Brite
P05-058	Brush, Stiff Bristle, Nonmetallic
P05-068	Gas, Nitrogen (PMC 2214)
P05-252	Pad, Scotch Brite
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P11-014	Alcohol, Isopropyl (PMC 9094)
P11-049	Cleaner, Wipe (SPMC 148)

B. Procedure
See Figures 608, 609 and 610.

NOTE: Use your previous experience to determine if you use cleaning solution to wash the engine gaspath.

CAUTION: TO PREVENT THE FORMATION OF ICE, WATER WASH SHOULD NOT BE DONE WHEN AMBIENT TEMPERATURE IS LESS THAN 40°F (4.4°C) UNLESS YOU ADD ISOPROPYL ALCOHOL TO THE WATER.

CAUTION: DO NOT DO THIS PROCEDURE ON ALL ENGINES DURING THE SAME MAINTENANCE VISIT.

(1) To prevent the formation of ice, do not do this water wash procedure when the ambient temperature is less than 40°F (4.4°C) unless you add isopropyl alcohol antifreeze to the water.

(2) Calibrate and install the wash equipment as follows:

(a) Connect the hoses, adapters, PWA 83298 Valve, and the two PWA 101041 Wash Nozzles to the water source.

(b) Turn on the water source.

(c) Adjust the PWA 83298 Flow Valve for approximately 15 US gallons (57 liters) per minute total flow (7.5 US gallons (28.5 liters) per minute from each nozzle).

NOTE: Use a container of known volume and a stop watch to calculate the flow rate.

(d) Make a mark on the valve and valve handle for the correct position.

(e) Turn off the source.

(3) Install the equipment to the engine as follows:

(a) Use two persons and carefully insert the PWA 101041 Wash Nozzles from the rear of the fan and core cowl fan exit area at approximately the 3 and 9 o'clock positions.

(b) Put the nozzles over the forward lip of the fan exit fairing (splitter) just aft of the fan blades.

(c) Make sure the flow will go into the engine core gaspath at approximately the 3 and 9 o'clock positions.

(d) Put the nozzles in position as not to touch the fan exit guide vanes.

(e) Carefully, attach the nozzle hooks to the fan and core cowl as follows:

1 Pull the hook handle aft

2 Engage the hook over the aft edge of the fan and core cowl to hold the wash nozzle in position.

3 Check that the four detail bolts on the clamp assembly are tight to hold the clamp in the correct position.

4 Attach the hoses and the valve to some adjacent structure so that they don't move during the washing and rinsing procedure.

(4) Examine the equipment installation as follows:

(a) If necessary, change the position of the wash nozzles for better attachment.

(b) Make sure there is enough clearance between the nozzles and the LPC 1st Stage fan blades for safe engine motoring.

(c) Make sure there is enough clearance between the nozzles and the LPC 1.6 stage blades for safe engine motoring.

(d) Make sure you can turn the low pressure compressor (LPC) freely.

(e) Make sure the hose and valve are not in the fan airstream and are correctly attached before you motor the engine with the starter.

(f) Make sure the hoses and valve are correctly attached to an adjacent structure so that they are not able to move during the washing and rinsing procedure.

(5) For optional water wash with cleaning solution, prepare 30 US gallons (113.56 liters) of SPS 87 Gaspath/Compressor Solution. Refer to 70-22-00, Solutions-02 (Task 70-22-00-980-002-087), Standard Practices Manual, PN 585005 for the make-up of this solution.

(a) The solution must be completely mixed and you must start the water wash within one hour after you mix the solution.

(6) For outside ambient temperatures less than 40°F (4.4°C), mix Isopropyl Alcohol P11-014 to the water as follows:

NOTE: At 40°F (4.4°C) and below, be careful when you do the water wash. Make sure no ice forms which could cause damage to the engine. Use Table 602 for the correct mixture.

Outside Air Temperature (OAT):	Percent Alcohol By Volume:
39°F (3.9°C)	5
36°F (2.7°C)	9

(CONTINUED)	
5°F (−15°C)	39
0°F (−17.8°C)	43

Minimum Required Alcohol/Water Mixtures
Table 602 (Continued)

(7) Motor the engine with the starter until 18 − 22 percent N2 is reached. Keep the N2 in this range during the washing and rinsing.

NOTE: The engine RPM will decrease as water is flowed into the gaspath.

CAUTION: DO NOT START THE WATER FLOW INTO THE GASPATH IF EGT IS ABOVE 150°F (66°C). IF YOU START THE WATER FLOW WITH THE EGT ABOVE 150°F (66°C) THE WATER WILL EVAPORATE FROM THE HOT SURFACES AND WILL NOT EFFECTIVELY CLEAN THE SURFACES.

(8) With the EGT less than 150°F (66°C), start the flow of water (or solution) into the gaspath at approximately 15 US gallons (57 liters) total flow.

(9) After approximately 45 seconds, stop the water flow and stop the starter motoring.

(10) Wait approximately five minutes.

(11) Do this wash procedure three times or until the water (or solution) from the tailpipe is clear.

NOTE: If the water flow from the tail pipe is dirty, benefit can be increased if you do the wash procedure again. The operator can do the wash procedure again at their discretion.

(12) If you used detergent cleaning solution, do the wash procedure two more times with water only.

NOTE: This is necessary to rinse all the detergent from the gaspath.

NOTE: The engine RPM will decrease as water is flowed into the gaspath.

CAUTION: REMOVE THE WATER WASH EQUIPMENT AS SOON AS POSSIBLE AND BEFORE YOU OPEN THE THRUST REVERSER. IF YOU TRY TO OPEN THE THRUST REVERSER WITH THE EQUIPMENT INSTALLED, YOU WILL CAUSE DAMAGE TO THE ENGINE AND/OR THRUST REVERSER.

(13) Remove the wash nozzles from the engine as follows:

(a) Remove hoses, adapters, and valve.

(b) Loosen the four bolts on the clamp assembly.

(c) Pull the hook handles aft.

(d) Carefully remove the wash hooks.

(14) Examine the LPC 1st stage (fan) blades, fairing, fan exit guide vanes and 1.6 Stage blades for any damage from the cleaning procedure.

(15) Hand wash LPC 1st stage (fan) blades by one of the methods that follow:

(a) Make a clean Lint Free Cotton Cloth (P05-005) or fine or medium Scotch Brite Pad (P05-252) moist with SPS 87 Gaspath Cleaner Solution. Wipe both sides of the fan blades (as possible) until clean. See Section 70-22-00, Solutions-02, Standard Practices Manual, PN 585005, for SPS 87 make-up. Rinse the blades thoroughly with clean water.

(b) Wipe the blades with SPMC 148 Wipe Cleaner (P11-049) on a clean cloth. A tampico or nylon brush may be used to scrub the fan blades. Wipe off with a clean cloth. Rinse is not necessary.

(16) Hand wash the Stage 1 LPC stator vanes with SPMC 148 Wipe Cleaner (P11-049) on a clean cloth. A tampico or nylon brush may be used to scrub LPC stator vanes. Wipe off with a clean cloth. Rinse is not necessary.

CAUTION: MAKE SURE YOU REMOVE THE WATER WASH EQUIPMENT BEFORE YOU OPEN THE THRUST REVERSER. IF YOU TRY TO OPEN THE THRUST REVERSER WITH THE EQUIPMENT INSTALLED, YOU WILL CAUSE DAMAGE TO THE ENGINE AND/OR THRUST REVERSER.

(17) Open the right and left fan and core cowl.

(18) Do an inspection and drain the EEC P2, P2.5 (with SCU), PAMB, PB, and P4.95 condensation traps. See 72-00-33, Inspection/Check-02 Task 72-00-33-210-001.

(19) Do an inspection and drain the PMUX (if installed) P2.5 condensation trap as follows:

  (a) Remove the lockwire and cap from the manifold tee. Permit the water to drain.

  CAUTION: USE OF LUBRICANTS ON PMUX SENSING TUBES, ADAPTERS, OR PACKINGS CAN RESULT IN CONTAMINATION OF THE PMUX.

  (b) Install the cap to the manifold tee. Torque the cap to 270 - 300 lb-in. (30.506 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(20) Remove any water from the EEC sensing system by the steps that follow:

  (a) Hold the adapters with a wrench and disconnect the sensing P2, P2.5, PAMB, P4.95, and PB hoses from the EEC, SCU or PMUX (if installed).

  (b) Install the necessary adapters and fittings to attach shop air or Nitrogen P05-068 to each sensing hose.

  CAUTION: DO NOT PUT PRESSURE INTO THE EEC, SCU, OR PMUX (IF INSTALLED). IF YOU DO, YOU CAN CAUSE DAMAGE TO THE EEC, SCU, OR PMUX.

  (c) Use 20 psi (137.9 kPa) shop air or Nitrogen P05-068 and remove any water from each sensing system.

  (d) Remove the adapters and fittings.

CAUTION: DO NOT USE LUBRICANTS ON EEC, SCU OR PMUX SENSING TUBES, ADAPTERS, OR PACKINGS. IF YOU DO, CONTAMINATION CAN OCCUR TO THESE COMPONENTS.

(21) Connect the EEC, SCU or PMUX (if installed) sensing hoses as follows:

(a) Do not apply lubricant to the hoses or adapters.

(b) Attach the rear PB flex hose (AS12) to the adapter in the port marked PB. Hold the adapter with a wrench and torque the flex hose nut to 270 − 300 lb−in. (30.506 − 33.895 N.m). (Post SB PW4ENG 72−645) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the hose nut(s) as applicable.

(c) Attach the P4.95 flex hose (AS13) to the adapter in the port marked P5. Hold the adapter with a wrench and torque the flex hose nut to 450 − 500 lb−in. (50.843 − 56.492 N.m). (Post SPN No. P3042) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the hose nut(s) as applicable.

(d) Attach the PAMB flex hose (AS10) to the adapter in the port marked PAMB. Hold the adapter with a wrench and torque the flex hose nut to 135 − 150 lb−in. (15.253 − 16.948 N.m). (Post SPN No. P3042) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the hose nut(s) as applicable.

(e) Attach the P2 flex hose (AS11) to the adapter marked P2. Hold the adapter with a wrench and torque the flex hose nut to 90 − 100 lb−in. (10.169 − 11.298 N.m). (Post SPN No. P3042) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the hose nut(s) as applicable.

(f) If the supplemental control unit has the multiplexing option, attach the P2.5 flex hose (AS38) to the adapter at the bottom side of the supplemental control unit. Hold the adapter with a wrench and torque the flex hose nut to 270 − 300 lb−in. (30.506 − 33.895 N.m). (Post SPN No. P3042) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the hose nut(s) as applicable.

(g) If the engine has a propulsion multiplexer unit (PMUX) installed, attach the P2.5 flex hose (AS32) to the adapter at the bottom side of the PMUX. Hold the adapter with a wrench and torque the flex hose nut to 135 - 150 lb-in. (15.253 - 16.948 N.m). (Post SPN No. P3042) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the hose nut(s) as applicable.

(h) Safety the PB sensing hose nut, on the EEC, with Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(22) Start the engine by the Engine Starting Procedure (Normal). See 71-00-00, Testing-00, Paragraph G. Task 71-00-00-990-003.

(a) Run at MINIMUM IDLE until main oil temperature is 220°F (104.4°C) minimum for a minimum of two minutes.

(b) Do the Engine Shutdown Procedure. See 71-00-00, Testing-00, Paragraph H. Task 71-00-00-990-003.

(23) Examine the P2, P2.5 (with SCU), PAMB, PB, and P4.95 condensation traps again. See 72-00-33, Inspection/ Check-02 Task 72-00-33-210-001.

NOTE: You must remove all water from the sense lines before you continue in service.

(24) Examine the PMUX (if installed) P2.5 condensation trap as follows:

NOTE: You must remove all water from the sense line before you continue in service.

(a) Remove the lockwire and cap from the manifold tee. Permit the water to drain.

CAUTION: USE OF LUBRICANTS ON PMUX SENSING TUBES, ADAPTERS, OR PACKINGS CAN RESULT IN CONTAMINATION OF THE PMUX.

(b) Install the cap to the manifold tee. Torque the cap to 270 - 300 lb-in. (30.506 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(25) Do an inspection of the turbine vane and blade cooling air valve air filter elements as follows:

NOTE: The procedure for removal of the filter elements from the left and right side of the engine is the same.

(a) Remove the lockwire and remove the case from the head assembly.

(b) Remove the filter element from the head assembly.

(c) Install protective closures on the head assembly.

(d) Examine the filter element for signs of an accumulation of contamination.

(e) If necessary, clean the filter element with Isopropyl Alcohol P11-014. Use a Nonmetallic, Stiff Bristle Brush P05-058 to remove stubborn accumulations of contamination.

(f) Dry the filter element with clean a Lint Free Cloth P05-005 or filtered, moisture free compressed air at 20 psig (138 kPa) maximum.

(g) If the filter remains contaminated after repeated cleanings, replace the filter element.

(h) Remove the protective closure from the head assembly and install the filter element to the head assembly. Tighten the filter element, handtight.

(i) Install the case to the head assembly and apply a torque of 20 - 25 lb-in. (2.260 - 2.825 N.m).

(j) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(k) Do steps (a) through (j) for each filter element location.

Task 72−00−00−990−004:

1. Introduction − General

A. Preliminary Instructions

(1) Thorough and intelligent inspection of all engine parts is one of the controlling factors in efficient and dependable maintenance, and too much emphasis cannot be placed on the importance of careful inspection and the decisions it involves. Inspection personnel must be thoroughly familiar with instructions in this chapter, in the requirements of the Standard Practices Manual and in Repair Sections.

B. Records and Limits

(1) Refer to the specific fits and clearances requirements in the appropriate Inspection/Check sections of this manual for proper limits. Attach a tag, indicating that replacement is necessary, to any part which is found to be unfit for further service. Attach a tag describing necessary refurbishment to any part which requires repair.

(2) When a new part is to be installed and it is important that it be identified as to engine number or position in engine; mark it by appropriate method described in Marking of Parts in Standard Practices Manual.

(3) When making out inspection records or reports, use only descriptive words which accurately qualify existing conditions. In order to eliminate confusion and to maintain consistent terminology, the various physical conditions and the determination of the usual causes of wear or damage to engine parts which might be encountered during inspection are defined in the Physical Inspection Section of Standard Practices Manual.

(4) Each life limited part must also have a part number and serial number on it. The marking of hours and cycles by engine model on the engine part(s) is optional to maintaining accurate accumulated service life (hours and cycles by engine model) in the form of permanent records, paper documents, or computer data base records. Refer to Standard Practices Manual, Section 70−30, Paragraph 2.C., Evaluation of Service Life (Hours and Cycles).

C. General Inspections

(1) See Standard Practices Manual as follows:

(a) Physical Inspection

(b) Magnetic Particle Inspection

(c) Fluorescent Penetrant Inspection

(d) Surface Treatments

(e) Welding

(f) Gage Inspection

D. Corrosion Prevention After Inspection

(1) After inspection, whenever it is deemed that sufficient time will elapse before reassembly to allow damage to parts from corrosion, cover all unprotected surfaces of magnesium and steel parts, or any parts with which corrosion difficulties are experienced, with Corrosion Preventive Oil P05−035. Unless the parts are otherwise preserved for longer periods of time, they should be recoated with Corrosion Preventive Oil P05−035, every four days.

E. X−Ray Inspection

(1) General

(a) Inspection/Check sections provide standards and acceptance limits applicable for parts requiring X−Ray inspection.

(b) For specific information not covered in Inspection/Check sections concerning X−Ray methods see 70−37−1, Standard Practices Manual.

Previous Pageblock Return to Previous Menu Next Pageblock

ENGINE GENERAL - INSPECTION/CHECK-01A

Task 72-00-00-990-010:

1. General Borescope Inspection Procedures And Borescope Access Port (AP) Data

A. General
See Figure 801, Figure 802 and Figure 803 and Table 801.

Access Port	Angular Location Clockwise From Rear	Part(s) Viewable For Inspection	Recommended Maximum Probe Diamter Inch/(mm)
Thru Fan	-------	1st C-Vane 1st C-Blades	----------
AP-1	245° (1)	Rear of 4th C-Blade Front of 4th C-Vane	----------
AP-2	233°	Rear of 5th C-Blade Front of 6th C-Blade	.270/6.8
AP-3	231°	Rear of 6th C-Blade Front of 7th C-Blade	.270/6.8
AP-4	127°	Rear of 8th C-Blade Front of 9th C-Blade	.270/6.8
AP-5	214°	Rear of 10th C-Blade Front of 11th C-Blade	.270/6.8
AP-6	98°	Rear of 12th C-Blade Front of 13th C-Blade	.270/6.8
AP-7	80°	Rear of 14th C-Blade Front of 15th C-Blade	.270/6.8
AP-8	277°	Fuel Nozzle Combustion Chamber 1st T-Vane	.444/11.3
AP-8	45° 128° 172° (2) 225° 338° (3) (1) (5)	Fuel Nozzle Combustion Chamber 1st T-Vane	.444/11.3 .444/11.3
AP-9	93°	Front of 1st T-Vane Front of 1st T-Blade	.270/6.8
AP-10	139°	Rear of 2nd T-Blade Front of 3rd T-Vane	.270/6.8
AP-11	215° (4)	Rear of 1st Turbine Blade Front of 2nd Turbine Blade	.444/11.3
Thru Exhaust	--------	6th T-Blade	----------

Table 801

Access Port	Angular Location Clockwise From Rear	Part(s) Viewable For Inspection	Recommended Maximum Probe Diamter Inch/(mm)
(CONTINUED) Case Struts			
		6th T-Vane	

NOTE: (1) Flexible probe required at this access port (optional all other ports).

NOTE: (2) Right angle eye piece required at this access port.

NOTE: (3) Right angle eye piece desirable at this access port.

NOTE: (4) Optional borescope port location.

NOTE: (5) For engines equipped, remove high temp sensor unit from (338°) port per Section 71-00-41, Removal-04 Task 72-00-41-050-001. Use flex probe to gain access.

Table 801 (Continued)

WARNING: BORESCOPE INSPECTIONS MUST BE PERFORMED IN A PROTECTED AREA. IF INSPECTIONS ARE PERFORMED IN WET WEATHER, APPROPRIATE PROTECTION MUST BE USED TO PREVENT DAMAGE TO EQUIPMENT OR POSSIBLE ELECTRICAL SHOCK TO THE OPERATOR.

CAUTION: BORESCOPE INSPECTION LIMITS ARE DERIVED FROM TESTING AND STRUCTURAL ANALYSIS. CONTINUED SERVICE OF PARTS AT OR NEAR MAXIMUM LIMITS MAY NOT BE ECONOMICALLY SOUND BECAUSE OF PERFORMANCE LOSS OR REDUCED PART LIFE.

(1) The provisions for borescope inspection of the engine represent a significant aid to effective maintenance. Borescope access is incorporated at 15 locations (16 for engines utilizing AP-11) along the engine gaspath, allowing for detailed examination of critical internal engine areas.

NOTE: Borescope ports used in the following procedures are identified by their "AP" (access port) designation as shown in Figure 801 and Figure 802.

(2) Inspection interval definition, (regular/reduced).

(a) The regular inspection interval referred to in this procedure is obtained from the Maintenance Planning Guide. The reduced interval is set at half that value. These inspection intervals may be adjusted based on operator experience and consultation with the local regulatory agency.

(b) The maximum damage limit assigned to either inspection interval is such that, under normal circumstances, the damage should not progress beyond an operable condition before the end of the applicable inspection interval. Usually, a greater level of damage is allowed when inspection at a reduced interval than at a regular interval becomes the increased inspection frequency greatly reduces the changes of the damage progressing beyond the operable condition before the next inspection. For some features, however, the damage is so critical that an expanded (reduced interval) limit is not prudent. Hence, the limit will be the same for regular and reduced intervals.

(3) No data is given in Table 801 to inspect the LPC airfoils between the Stages 1.6 and 4 blades. However, if damage is seen while viewing through the fan inlet, the allowable damage limit given for the 4th stage vanes in step 1.B.(3) will apply to LPC Stages 1.6, 2, and 3 vanes, and the damage limits given for the 4th stage blades in step 1.B.(4) will apply to the Stage 2 and 3 blades.

B. Special Borescope Equipment

CAUTION: TEMPERATURES IN AREAS TO BE BORESCOPED SHOULD BE PERMITTED TO COOL TO BELOW 150°F (65.6°C) FOLLOWING ENGINE OPERATION. DAMAGE MAY RESULT TO BORESCOPE EQUIPMENT IF EQUIPMENT IS EXPOSED TO GASPATH OR METAL TEMPERATURES IN EXCESS OF 150°F (65.6°C). AS A GUIDE − IF ADJACENT CASES ARE TOO HOT TO TOUCH COMFORTABLY, INSPECTION SHOULD BE DELAYED.

(1) Borescope inspection equipment for the PW4000 Engine should satisfy the requirements of CTE 6181 as published by Support Equipment Engineering, Pratt &

Whitney, Commercial Products Division, 400 Main Street, MS 118−03 East Hartford, CT 06108

(2) Specification CTE 6181 identifies the equipment and associated hardware (such as power source, light cables, adapter etc.) required during borescope inspection and sets the quality and functional standards for this equipment. In summary the following borescope equipment is recommended:

(a) Low magnification rigid borescope,.........AP−2−7, 9 (0.270 inch/(6.8 mm) barrel diameter maximum)

(b) High magnification rigid borescope,.........AP−8, 11 (0.444 inch/(11.3 mm) barrel diameter maximum)

(c) Flexible borescope,......AP−1, (optional for AP2−8) (0.270 inch/(6.8 mm) cable diameter maximum)

(3) Optional borescope equipment and sizes are also provided in CTE 6181 to enhance the borescoping capability and ease the task for the inspector. These items range from clamping equipment to hold the borescope in position to optical video equipment to view and videotape record the borescoping session for later in depth review.

Task 72−00−00−480−001:

2. Installation Of the Rotator Used To Turn The N2 Rotor

A. Equipment And Materials Required

Special Tools:

PWA 49058	Rotator, Hand (Hand Crank) Optional
PWA 76271	Control Kit, Engine Turning
PWA 85572−1	Compressor Rotating Kit (Foot Operated) Optional to PWA 85572
PWA 85572−2	Compressor Rotating Kit (Hand Operated) Optional to PWA 85572−1
PWA 85768	Puller, Knocker
PWA 86441	Drive Unit
PWA 102089	Control Kit, Engine Turning (Alternate to PWA 85572−1 and 2) (Used with PWA 102093 or PWA 102390)

Special Tools:

(CONTINUED)

PWA 102093	Drive Adapter, Engine Turning (Used with PWA 102089) (Optional to PWA 102390)
PWA 102390	Drive Adapter, Engine Turning (Used with PWA 102089) (PWA 102093)

Special Borescope Equipment:
See Task 72-00-00-990-010 for Special Borescope Equipment.

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
R	P06-054	Paste, Anti-Seize (PWA 36246)

Expendable Parts:

Packing	1	72-61-00/8/160

B. Rotation Of High Pressure Rotor During Borescope Inspection

(1) Full 360 degree borescope inspection of the high pressure rotor can be accomplished using the rotorcranking provision on the gearbox.

(2) Remove manual crank pad cover on main gearbox. See Figure 804.

CAUTION: DO NOT REMOVE THE GEARBOX (SCAVENGE PUMP DRIVE) BEARING HOUSING ASSEMBLY. INSTALLATION OF THE BEARING HOUSING ASSEMBLY IS DIFFICULT. INCORRECT INSTALLATION WILL DAMAGE THE BEARING.

(a) Remove two bolts and two washers securing manual crank pad cover. Using PWA 85768 Puller, remove crank pad cover. Discard packing from stem of cover.

(3) To install the Pneumatic N2 Rotor Turning Tool:

(Task 72−00−00−990−010)

(a) Attach PWA 85572−1 Foot Operated Rotator or PWA 85572−2 Hand Operated Rotator to N2 rotator pad. Make sure socket drive in the angle drive adapter aligns correctly with hex end of oil pump idler gear in gearbox and secure using two 1/4 − 28 cap screws provided. Attach an air supply to the pneumatic motor. Actuate using foot or hand control.

NOTE: Use of motor−drive unit will free operator to use both hands to position and adjust the borescope. It is recommended that rotation be stopped as each rotor blade is positioned properly for inspection. This will allow thorough, detailed appraisal of each blade's condition.

(4) To install the alternate Jupitor Corporation Electronic N2 Rotor Turning Tool Kit. See Figure 805.

(a) Engage the PWA 86441 Drive Unit to the hex shaped internal drive at the N2 rotator pad and connect with two 1/4 x 20 nuts. Engage this drive unit to the power unit detail of the PWA 76271 Control Kit with the detail cable as shown in figure.

(b) Use the remaining three cables to connect the controller and the power source to the power unit detail and the remote foot switch to the controller. Set the controller so the preprogramed instructions in the controller match the engine being inspected.

(c) Operate the Digital Turning Tool, during borescope inspection, in accordance with the Manufactures Instruction Manual included with the PWA 76271 Kit.

(5) To install the alternate PWA 49058 Hand Rotator:

(a) Install the elbow to the handle and attach with the shoulder screw. Tighten the screw with the attached allen wrench.

(b) If necessary, adjust the angle of the elbow to the rod assembly with the set screw. Use the attached allen wrench.

(c) Install the socket and PW4000 bracket to the hex shaped internal drive at the N2 rotator pad. Attach with the two bracket bolts and check nuts.

(d) Install the ratchet and handle assembly to the socket on the crank pad.

(e) The lever assembly on the handle has a position for clockwise and counterclockwise N2 rotation.

(f) Turn the handle to rotate the N2 rotor during the borescope blade inspection procedure.

(6) Install the alternate PWA 102089 Controller Kit as follows:

NOTE: This is the Rhinestahl Corporation Engine Turning Controller Kit.

(a) Install the PWA 102093 Drive Adapter or PWA 102390 Drive Adapter to the N2 rotator pad. Make sure the drive in the drive adapter aligns correctly with hex end of oil pump idler gear in the gearbox.

(b) Attach the power drive unit of the PWA 102089 Controller Kit to the PWA 102093 Drive Adapter or PWA 102390 Drive Adapter.

(c) Follow the manufacturer's instructions for assembly of the rotator kit.

(d) Connect the electrical power cable to a power source.

(7) Remove the rotator from the gearbox and install manual crank pad cover. See Figure 804.

(a) Remove the power cable from the power unit or remove the air supply to the pneumatic motor.

(b) Remove the cables from the rotator and controller.

(c) Remove the two rotator attachment bolts.

(d) Remove the rotator from the gearbox.

(e) Install packing lubricated with Engine Oil P03−001, in groove on stem of manual crank pad cover. Install cover and secure with two washers
R and two bolts lubricated with Anti−Seize Paste
R P06−054. Remove the unwanted paste. Torque bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

C. Postrequisites

(1) Do an oil leak check of the gearbox crank pad cover. Do 71−00−00 Testing−03 − Idle Power Test, Task 71−00−00−760−030.

Table 801

Access Port	Angular Location Clockwise From Rear	Part(s) Viewable For Inspection	Recommended Maximum Probe Diamter Inch/(mm)
(CONTINUED) Struts			
		6th T-Vane	

NOTE: (1) Flexible probe required at this access port (optional all other ports).

NOTE: (2) Right angle eye piece required at this access port.

NOTE: (3) Right angle eye piece desirable at this access port.

NOTE: (4) Optional borescope port location.

NOTE: (5) For engines equipped, remove high temp sensor unit from (338°) port per Section 71-00-41, Removal-04 Task 72-00-41-050-001. Use flex probe to gain access.

Table 801 (Continued)

WARNING: BORESCOPE INSPECTIONS MUST BE PERFORMED IN A PROTECTED AREA. IF INSPECTIONS ARE PERFORMED IN WET WEATHER, APPROPRIATE PROTECTION MUST BE USED TO PREVENT DAMAGE TO EQUIPMENT OR POSSIBLE ELECTRICAL SHOCK TO THE OPERATOR.

CAUTION: BORESCOPE INSPECTION LIMITS ARE DERIVED FROM TESTING AND STRUCTURAL ANALYSIS. CONTINUED SERVICE OF PARTS AT OR NEAR MAXIMUM LIMITS MAY NOT BE ECONOMICALLY SOUND BECAUSE OF PERFORMANCE LOSS OR REDUCED PART LIFE.

(1) The provisions for borescope inspection of the engine represent a significant aid to effective maintenance. Borescope access is incorporated at 14 locations (15 for engines utilizing AP-11) along the engine gaspath, to permit detailed examination of critical internal engine areas.

NOTE: Borescope ports used in the following procedures are identified by their "AP" (access port) designation as shown in Figure 801 and Figure 802.

(2) Inspection interval definition, (regular/reduced).

(a) The regular inspection interval referred to in this procedure is obtained from the Maintenance Planning Guide. The reduced interval is set at half that value. These inspection intervals may be adjusted based on operator experience and consultation with the local regulatory agency.

(b) The maximum damage limit assigned to either inspection interval is such that, under normal circumstances, the damage should not progress beyond an operable condition before the end of the applicable inspection interval. Usually, a greater level of damage is allowed when inspection at a reduced interval than at a regular interval becomes the increased inspection frequency greatly reduces the changes of the damage progressing beyond the operable condition before the next inspection. For some features, however, the damage is so critical that an expanded (reduced interval) limit is not prudent. Hence, the limit will be the same for regular and reduced intervals.

(3) No data is given in Table 801 to inspect the LPC airfoils between the Stages 1.6 and 4 blades. However, if damage is seen while viewing through the fan inlet, the allowable damage limit given for the 4th stage vanes in step 1.B.(3) will apply to LPC Stages 1.6, 2, and 3 vanes, and the damage limits given for the 4th stage blades in step 1.B.(4) will apply to the Stage 2 and 3 blades.

B. Special Borescope Equipment

CAUTION: TEMPERATURES IN AREAS TO BE BORESCOPED SHOULD BE PERMITTED TO COOL TO BELOW 150°F (65.6°C) FOLLOWING ENGINE OPERATION. DAMAGE MAY RESULT TO BORESCOPE EQUIPMENT IF EQUIPMENT IS EXPOSED TO GASPATH OR METAL TEMPERATURES IN EXCESS OF 150°F (65.6°C). AS A GUIDE − IF ADJACENT CASES ARE TOO HOT TO TOUCH COMFORTABLY, INSPECTION SHOULD BE DELAYED.

(1) Borescope inspection equipment for the PW4000 Engine should satisfy the requirements of CTE 6181 as published by Support Equipment Engineering, Pratt & Whitney, Commercial Products Division, 400 Main Street, MS 118−03 East Hartford, CT 06108

(2) Specification CTE 6181 identifies the equipment and associated hardware (such as power source, light cables, adapter etc.) required during borescope inspection and sets the quality and functional standards for this equipment. In summary the following borescope equipment is recommended:

(a) Low magnification rigid borescope,........AP−2−7 (0.270 inch/(6.8 mm) barrel diameter maximum)

(b) High magnification rigid borescope,.......AP−11 (0.444 inch/(11.3 mm) barrel diameter maximum)

(c) Flexible borescope,......................AP−1, AP−8 (optional for AP2−7) (0.270 inch/(6.8 mm) cable diameter maximum)

(3) Optional borescope equipment and sizes are also provided in CTE 6181 to enhance the borescoping capability and ease the task for the inspector. These items range from clamping equipment to hold the borescope in position to optical video equipment to view and videotape record the borescoping session for later in depth review.

Task 72−00−00−480−002:

2. Installation Of the Rotator Used To Turn The N2 Rotor

A. Equipment And Materials Necessary

Special Tools:

PWA 49058	Rotator, Hand (Hand Crank) Optional
PWA 76271	Control Kit, Engine Turning
PWA 85572−1	Compressor Rotating Kit (Foot Operated) Optional to PWA 85572
PWA 85572−2	Compressor Rotating Kit (Hand Operated) Optional to PWA 85572−1
PWA 85768	Puller, Knocker
PWA 86441	Drive Unit
PWA 102089	Control Kit, Engine Turning (Alternate to PWA 85572−1 and 2) (Used with PWA 102093 or PWA 102390)
PWA 102093	Drive Adapter, Engine Turning (Used with PWA 102089) (Optional to PWA 102390)
PWA 102390	Drive Adapter, Engine Turning (Used with PWA 102089) (PWA 102093)

B. Rotation Of High Pressure Rotor During Borescope Inspection

(1) Full 360 degree borescope inspection of the high pressure rotor can be accomplished using the rotorcranking provision on the gearbox.

(2) Remove manual crank pad cover on main gearbox. See Figure 804.

CAUTION: DO NOT REMOVE THE GEARBOX (SCAVENGE PUMP DRIVE) BEARING HOUSING ASSEMBLY. INSTALLATION OF THE BEARING HOUSING ASSEMBLY IS DIFFICULT. INCORRECT INSTALLATION WILL DAMAGE THE BEARING.

(a) Remove two bolts and two washers that attach the manual crank pad cover. Using PWA 85768 Puller, remove crank pad cover. Discard packing from stem of cover.

(3) To install the Pneumatic N2 Rotor Turning Tool:

(a) Attach PWA 85572-1 Foot Operated Rotator or PWA 85572-2 Hand Operated Rotator to the N2 rotator pad. Make sure the socket drive in the angle drive adapter aligns correctly with the hex end of the oil pump idler gear in the gearbox and attach with two 1/4 - 28 cap screws provided. Attach an

air supply to the pneumatic motor. Actuate using foot or hand control.

NOTE: Use of motor-drive unit will free the operator to use both hands to position and adjust the borescope. It is recommended that rotation be stopped as each rotor blade is positioned properly for inspection. This will allow thorough, detailed appraisal of each blade's condition.

(4) To install the alternate Jupitor Corporation Electronic N2 Rotor Turning Tool Kit. See Figure 805.

(a) Engage the PWA 86441 Drive Unit to the hex shaped internal drive at the N2 rotator pad and connect with two 1/4 x 20 nuts. Engage this drive unit to the power unit detail of the PWA 76271 Control Kit with the detail cable as shown in the figure.

(b) Use the remaining three cables to connect the controller and the power source to the power unit detail and the remote foot switch to the controller. Set the controller so the preprogramed instructions in the controller match the engine being inspected.

(c) Operate the Digital Turning Tool, during borescope inspection, in accordance with the Manufactures Instruction Manual included with the PWA 76271 Kit.

(5) To install the alternate PWA 49058 Hand Rotator:

(a) Install the elbow to the handle and attach with the shoulder screw. Tighten the screw with the attached allen wrench.

(b) If necessary, adjust the angle of the elbow to the rod assembly with the set screw. Use the attached allen wrench.

(c) Install the socket and PW4000 bracket to the hex shaped internal drive at the N2 rotator pad. Attach with the two bracket bolts and check nuts.

(d) Install the ratchet and handle assembly to the socket on the crank pad.

(e) The lever assembly on the handle has a position for clockwise and counterclockwise N2 rotation.

(f) Turn the handle to rotate the N2 rotor during the borescope blade inspection procedure.

(6) Install the alternate PWA 102089 Controller Kit as follows:

NOTE: This is the Rhinestahl Corporation Engine Turning Controller Kit.

(a) Install the PWA 102093 Drive Adapter or PWA 102390 Drive Adapter to the N2 rotator pad. Make sure the drive in the drive adapter aligns correctly with hex end of oil pump idler gear in the gearbox.

(b) Attach the power drive unit of the PWA 102089 Controller Kit to the PWA 102093 Drive Adapter or PWA 102390 Drive Adapter.

(c) Follow the manufacturer's instructions for assembly of the rotator kit.

(d) Connect the electrical power cable to a power source.

(7) Remove the rotator from the gearbox and install manual crank pad cover. See Figure 804.

(a) Remove the power cable from the power unit or remove the air supply to the pneumatic motor.

(b) Remove the cables from the rotator and controller.

(c) Remove the two rotator attachment bolts.

(d) Remove the rotator from the gearbox.

(e) Install packing lubricated with Engine Oil P03-001, in the groove on the stem of manual crank pad cover. Install the cover and attach with two
R washers and two bolts lubricated with Anti-Seize
R Paste P06-054. Remove the unwanted paste. Torque bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m).

C. Postrequisites

(1) Do an oil leak check of the gearbox crank pad cover. Do 71−00−00 Testing−03 − Idle Power Test, Task 71−00−00−760−030.

ENGINE GENERAL - INSPECTION/CHECK-01B

Task 72-00-00-210-003:

1. Perform Borescope Inspection Of Low Pressure Compressor (LPC)

A. Equipment And Materials Required

Standard Tools:
See Inspection/Check-01A for borescope equipment.

B. Procedure For Inspecting Stage 4 LPC Blades And Vanes

(1) Access to LPC Stage 4 blades and vanes is provided at AP-1 access port location through any of fourteen (14) openings in the fan exit case inner liner and an open 2.5 bleed valve. See Figure 801. Refer to
R 72-00-00, Inspection/Check-01A (Task 72-00-00-990-010)
R or (Task 72-00-00-990-011) Table 801 for additional AP-1 borescope access port data.

NOTE: Eight (8) of the fourteen (14) openings in the fan exit case inner liner across top of engine contain protective screens which must be removed to gain borescope access. The remaining six (6) openings across bottom of engine do not contain these screens and borescope access is direct. Removal of protective screens requires removal of flow path liner and bleed exit duct (see 72-33-00, Disassembly-01).

CAUTION: TEMPERATURES IN AREAS TO BE BORESCOPED SHOULD BE PERMITTED TO COOL TO BELOW 150°F (65.6°C) FOLLOWING ENGINE OPERATION. DAMAGE MAY RESULT TO BORESCOPE EQUIPMENT IF EQUIPMENT IS EXPOSED TO GASPATH OR METAL TEMPERATURES IN EXCESS OF 150°F (65.6°C). AS A GUIDE - IF ADJACENT CASES ARE TOO HOT TO TOUCH COMFORTABLY, INSPECTION SHOULD BE DELAYED.

(2) Insert a flexible (non-rigid) borescope through the AP-1 opening, and inspect condition of Stage 4 vanes and blades. Damaged parts must be evaluated for serviceability as described in steps (3) and (4).

CAUTION: THE FOLLOWING CONTINUE-IN-SERVICE LIMITS FOR FOREIGN OBJECT DAMAGE OBSERVED THROUGH AP-1 BORESCOPE INSPECTION PORTS ARE INTENDED AS A GUIDE TO DETERMINE WHETHER ENGINE MAY REMAIN IN SERVICE OR A REPAIR IS NECESSARY. IT IS IMPORTANT THAT CAUSE OF FOREIGN OBJECT DAMAGE BE DETERMINED TO ENSURE COMPRESSOR INTEGRITY

SINCE IT MAY BE AN INDICATION OF MORE SERIOUS PROBLEMS. SHOULD COMPRESSOR INTEGRITY BE QUESTIONED, COMPONENT IS TO BE REPLACED.

(3) Borescope inspection (continue-in-service) limits for Stage 4 vanes. See Figure 802 and Figure 803.

NOTE: During borescope inspection, if a potential defect appears to exceed the allowable "damage limits", examine the area closely to determine if the condition being evaluated is a defect or previously blended damage.

NOTE: (Blended areas are recognizable by a 4 to 1 length to depth blend ratio and smooth round corners).

NOTE: This determination is an important one because a blended area could exceed the "damage limits" allowed for a defect.

(a) Damage in form of nicks and dents on leading and trailing edge which are shallower than 0.050 inch (1.270 mm) deep and which are at least 0.5000 inch (12.700 mm) apart.

(b) Damage on both edges must not be directly opposite and must be separated diagonally by minimum distance equal to mean chordal length of vane.

(c) Dents in Area A which are less than 0.010 inch (0.254 mm) deep and which are at least 1.000 inch (25.400 mm) apart. Any material tears in this area must be repaired by replacing vanes.

(4) Borescope inspection (continue-in-service) limits for Stage 4 blades. See Figure 804.

NOTE: During borescope inspection, if a potential defect appears to exceed the allowable "damage limits", examine the area closely to determine if the condition being evaluated is a defect or previously blended damage.

NOTE: (Blended areas are recognizable by a 4 to 1 length to depth blend ratio and smooth round corners).

NOTE: This determination is an important one because a blended area could exceed the "damage limits" allowed for a defect.

(a) Damage approximately 0.0312 inch (0.792 mm) deep in Area A and which is at least 1.000 inch (25.400 mm) apart on either leading or trailing edge.

(b) Damage on both edges must not be directly opposite and must be separated diagonally by a minimum distance equal to mean chordal length of blade. (See Figure 803).

(c) Damage in Area B which is smaller than 0.0312 inch (0.792 mm) round bottomed indication and which does not have material tears.

(d) Damage in Area C is not allowed unless blended.

ENGINE GENERAL - INSPECTION/CHECK-01C

Task 72-00-00-210-004:

1. Perform Borescope Inspection Of High Pressure Compressor (HPC)

A. Equipment And Materials Necessary

Standard Tools:
See 72-00-00 Inspection/Check-01A (Task 72-00-00-990-010)
For Borescope Equipment.

Special Tools:

	PWA 75250	Wrench, (AP-5 And AP-7 Inner Plug)
	PWA 86580	Driver, (AP-5 And AP-7 Inner Plug)
R	PWA 101674	Crimper, Mechanical (AP-2, AP-3, AP-5 And AP-7 Plugs)

Consumable Materials:

Item No.	Designation
P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Key Washer (AP2)	1	72-35-00/16/5
Key Washer (AP3)	1	72-35-00/16/15
Key Washer (AP5 And AP7)	2	72-35-00/22/10 or 72-35-00/22/10A

B. Procedure For Inspecting HPC Rotor And Stator Assembly
See Figure 801, Figure 802, Figure 803, Figure 804, Figure 805 and Figure 806.

CAUTION: SEE THE FOLLOWING STEP FOR ADDITIONAL REQUIREMENTS FOR REMOVING THE AP-2 AND AP-3 PLUGS OR DAMAGE TO THE SYNCHRONIZING RING CAN OCCUR.

(1) Remove plug(s) from borescope access port(s) (AP's). Access to HPC gaspath is provided at six AP locations along the HPC front and rear compressor cases. Identified as AP-2, AP-3, AP-4, AP-5, AP-6 and AP-7, these six access ports enable borescope viewing of

specific blade and vane areas as illustrated in Figure 801 through Figure 806.

NOTE: Table 801, 72-00-00 Inspection/Check-01A (Task 72-00-00-990-010) provides additional AP-2 through AP-7 data.

NOTE: PWA 75250 Wrench and PWA 86580 Driver can be used on engines without QEC installed. Engines with QEC installed, you must use PWA 86580 Driver to remove the inner plugs AP-5 and AP-7.

CAUTION: IF NECESSARY, TURN THE SYNCHRONIZING RINGS FOR ACCESS TO THE AP-2 AND AP-3 PLUGS. DO NOT PRY AGAINST THE RING LEVERS. USE A STANDARD CROWS FOOT WRENCH AND TURN THE BELLCRANK. IF YOU DO NOT DO THIS, DAMAGE TO THE ENGINE CAN OCCUR.

CAUTION: FOR AP-2 AND AP-3 PLUGS, THE 6TH STAGE SYNCHRONIZING RING MUST BE IN ITS REARMOST POSITION TO PROVIDE SUFFICIENT CLEARANCE TO REMOVE THE PLUG OR DAMAGE TO THE SYNCHRONIZING RING CAN OCCUR. WHEN THE SYNCHRONIZING RING IS IN ITS REARMOST POSITION, THE VANE ARMS WILL BE APPROXIMATELY AXIAL TO THE ENGINE.

(2) Do this step if access to AP-2 and AP-3 borescope port plugs (at 7 o'clock position) is blocked by the synchronizing ring, stator vane actuator(SVA) synchronizing ring arm, or if a better view of the blades and vanes is necessary during borescope inspection.

(a) Install a standard Crows Foot wrench on SVA Bellcrank (flats), adjacent to Stage 5 adjustor. Push on the wrench in the applicable (up or down) direction. This turns the syncronizing ring and moves the ring arms and variable vanes.

CAUTION: TEMPERATURES IN AREAS TO BE BORESCOPED SHOULD BE PERMITTED TO COOL TO BELOW 150°F (65.6°C) FOLLOWING ENGINE OPERATION. DAMAGE MAY RESULT TO BORESCOPE EQUIPMENT IF EQUIPMENT IS EXPOSED TO GASPATH OR METAL TEMPERATURES IN EXCESS OF 150°F (65.6°C). AS A GUIDE -

IF ADJACENT CASES ARE TOO HOT TO TOUCH COMFORTABLY, INSPECTION SHOULD BE DELAYED.

(3) Insert borescope through applicable port (AP-2 through AP-7) and inspect condition of HPC blades and vanes. Damaged parts must be evaluated for serviceability as described in steps (3) through (6).

NOTE: Full 360 degree inspection of the HPC rotor can be accomplished by using manual or power equipment on the cranking provision on the main gearbox. See 72-00-00 Inspection/Check-01A, Installation Of The Rotator Used To Turn The N2 Rotor, (Task 72-00-00-480-001).

NOTE: It can be possible to view outer airseal rubstrip areas during borescope inspection of the HPC but rubstrip inspection is not mandatory. If rubstrips are inspected:

NOTE: For Stages 6 and 7, there is no limit to missing feltmetal, feltmetal disbond, or chunk out provided there is no airfoil damage beyond the acceptable Continue in Service limits and that the engine has no history of operational, or stability abnormalities.

NOTE: For the remaining Stages, if missing feltmetal, disbond or chunk out is seen, then only up to four areas of material can be missing for a maximum area of 3.000 square inches (1935. sq. mm) for any one stage.

(4) Inspect HPC Stages 5 through 7 blades for curled leading edge/blade tip. Blades within limits listed below and in Figure 807 (Sheet 1) are acceptable.

NOTE: Curled leading edge/blade tip is defined as a triangular piece of blade material formed by bending about a line connecting points on leading edge and blade tip, respectively, whose average convex surface contour (curl) is greater than 20 degrees but less than or equal to 90 degrees out of plane angle (toward the convex blade side), with average concave blade contour.

(a) Maximum of six curled blades.

(b) Curled blades must be separated by at least three non-curled blades.

(c) Borescope inspection limits for blade surface damage in all other areas other than Index 5 of Figure 807 (Sheet 1) are applicable.

(5) Inspect all HPC Stages 5 through 7 blades for bending of the leading edge, refer to Figure 807 (Sheet 2).

(a) No bending permitted on adjacent blades.

(b) Bending not permitted on more than (6) blades per stage.

(c) No tears or cracks are permitted. Bends must be smooth and continuous.

(d) No more than one bend per blade is permitted.

(6) Borescope inspect HPC Stages 9 through 15 tangential blade locks.

(a) Inspect for loose/improperly seated blade locks. The engine may be continued-in-service with up to two loose Stage 9 through 15 blade locks (per stage) until the next regularly scheduled HPC disassembly.

(7) Borescope inspect HPC Stage 9 through 15 blade seals.

(a) Inspect for loose/missing blade seals (Reference 72-35-22). The engine may be continued-in-service with loose/missing Stage 9 through 15 blade seals until the next regularly scheduled HPC disassembly.

CAUTION: THE FOLLOWING BLADE NICK LIMITS FOR FOREIGN OBJECT DAMAGE OBSERVED THROUGH THE BORESCOPE INSPECTION PORTS ARE INTENDED AS A GUIDE TO DETERMINE WHETHER THE ENGINE MAY REMAIN IN SERVICE OR A REPAIR IS NECESSARY. IT IS IMPORTANT THAT THE CAUSE OF THE FOREIGN OBJECT DAMAGE BE DETERMINED TO ENSURE COMPRESSOR INTEGRITY SINCE IT MAY BE AN INDICATION OF MORE SERIOUS PROBLEMS. SHOULD

COMPRESSOR INTEGRITY BE QUESTIONED, THE COMPONENT IS TO BE REPLACED.

(8) Borescope inspection (service limits) compressor blade (Stages 5 through 15) - nicks and dents. See Figure 808, Figure 809, and Figure 810.

NOTE: During borescope inspection, if a potential defect appears to exceed the allowable "damage limits", examine the area closely to determine if the condition being evaluated is a defect or previously blended damage.

NOTE: (Blended areas are recognizable by a 4 to 1 length to depth blend ratio and smooth round corners).

NOTE: This determination is an important one because a blended area could exceed the "damage limits" allowed for a defect.

NOTE: Stages 12 and 13 blades cannot be In-situ blended for an engine that has incorporated the HPC ring case since it prevents the ability to insert the blending tool through the AP-6 borescope port.

(a) HPC continue-in-service and reairable limits are provided on the Figure 808, Figure 809 and Figure 810. The borescope ports for each stage are provided as follows:

STAGE (BLADES)	AP PLUG
Stage 5	(AP-2)
Stage 6	(AP-2/AP-3)
Stage 7	(AP-3)
Stage 8	(AP-4)
Stage 9	(AP-4)
Stage 10	(AP-5)
Stage 11	(AP-5)
Stage 12	(AP-6)
Stage 13	(AP-6)
Stage 14	(AP-7)
Stage 15	(AP-7)

(b) In−situ (assembled engine) blend repairs are permitted by 72−00−00, Repair−02 (Task 72−00−00−300−002) if damage is within the limits shown in Figure 809 and as follows:

NOTE: Limits shown in Figure 809 are the maximum size that can be repaired by in−situ repair. The in−situ repair will remove additional material. The final repair depth is controlled by the in−situ repair procedure.

NOTE: Repairs are allowed for the leading and trailing edges except as noted.

1 Blend repairs are only allowed where shown.

2 Multiple blends are permitted to a maximum depth of the limits shown in Figure 808.

3 One blend in each blade is permitted to the maximum depth shown in Figure 809.

4 All blends must be separated by a minimum of 0.125 inch (3.175 mm).

5 Blends on both edges must not be directly opposite and must be separated diagonally by a minimum distance equal to the mean chordal length of the blade. See Figure 810.

(c) There is no limit to the number of blades in a single stage or for all nine stages that can be blended by this method.

(d) Damage in Area C that is near the change into Area A on the leading and trailing edges only, can be repaired by 72−00−00, Repair−02 (Task 72−00−00−300−002) to the limits of Area C in Figure 809. However, tooling clearances with the outer duct can prevent a successful repair. It is not possible to blend damage on the blade tips due to tooling clearance with the outer ducts. If a successful repair cannot be accomplished and the damage exceeds the continue−in−service limits, then the blade must be replaced.

(e) Replace In-situ blend repaired blades at the next overhaul if blend repairs are greater than the repair limits specified for that blade.

CAUTION: THE FOLLOWING VANE NICK LIMITS FOR FOREIGN OBJECT DAMAGE OBSERVED THROUGH BORESCOPE INSPECTION PORTS ARE INTENDED AS A GUIDE TO DETERMINE WHETHER ENGINE MAY REMAIN IN SERVICE OR A REPAIR IS NECESSARY. IT IS IMPORTANT THAT CAUSE OF THE FOREIGN OBJECT DAMAGE BE DETERMINED TO ENSURE COMPRESSOR INTEGRITY SINCE IT MAY BE AN INDICATION OF MORE SERIOUS PROBLEMS. SHOULD COMPRESSOR INTEGRITY BE QUESTIONED, COMPONENT IS TO BE REPLACED.

(9) Borescope inspection (service limits) compressor stator vanes (IGV and Stages 5 through 15). See Figure 811, Figure 812 (Sheets 1 through 5), and Figure 813.

NOTE: During borescope inspection, if a potential defect appears to exceed the allowable "damage limits", examine the area closely to determine if the condition being evaluated is a defect or previously blended damage.

NOTE: (Blended areas are recognizable by a 4 to 1 length to depth blend ratio and smooth round corners).

NOTE: This determination is an important one because a blended area could exceed the "damage limits" allowed for a defect.

(a) Vane service limits - nicks. See Figure 811 and Figure 812.

1 Nicks to maximum depth on leading edge and nicks to maximum depth on trailing edge must not be at same radial station and must be radially separated by not less than vane chordal length. Nicks to leading and trailing edges not to maximum depth limit and within chordal length radial spacing, are acceptable only if combined nicked leading edge depth and nicked trailing edge depth does not exceed above single nick limit.

2 No more than two nicks to maximum depth limit allowed per vane.

3 Total nicked length on any vane edge shall not be in excess of 1/8 of the total edge length.

4 No cracks allowed.

(b) Vane service limits - missing braze.

1 For 14th stage stator only: Missing braze is permitted at the vane to shroud OD fillet radius for the two 14th stage vanes adjacent to the AP-7 borescope port.

(10) After borescope inspection, install applicable AP-2 through AP-7 plug(s) and where removed, a new key washer per requirement of Table 801 and as follows:

CAUTION: IT IS VERY IMPORTANT TO OBEY THE PROCEDURES IN THE STANDARD PRACTICES MANUAL, PN 585005 70-53, LOCKING DEVICES, WHEN YOU INSTALL (BORESCOPE) PLUG KEY WASHERS. INCORRECT INSTALLATION OF THE KEY WASHERS CAN CAUSE THE (BORESCOPE) PLUGS TO COME OUT. IF AN AP-5 OR AP-7 (BORESCOPE) PLUG IS NOT THERE, HOT GASES FROM THE PLUG OPENING CAN CAUSE DAMAGE TO THE THRUST REVERSER.

(a) (Pre SB PW4ENG 72-675) (AP-5 and AP-7) and all AP-2, AP-3, AP-4 and AP-6: Prior to installing borescope plugs, remove excess baked on compound from threads using a nylon brush. Apply Antiseize Paste P06-054 to threads and to plug head washer contact surface area. Wipe off unwanted paste. Do not use Engine Oil P03-001. Run in borescope plug to be sure plug is seated before applying torque by Table 801. R

CAUTION: DO NOT APPLY ANTISEIZE PASTE P06-054 TO THE THREADS AND WASHER FACE OF THE POST SB PW4ENG 72-675 PLUGS. THESE PLUGS HAVE BAKED ON ANTIGALLANT COMPOUND.

CAUTION: IT IS VERY IMPORTANT TO OBEY THE PROCEDURES IN THE STANDARD PRACTICES MANUAL, PN 585005 70-53, LOCKING DEVICES, WHEN YOU INSTALL (BORESCOPE)

PLUG KEY WASHERS. INCORRECT INSTALLATION OF THE KEY WASHERS CAN CAUSE THE (BORESCOPE) PLUGS TO COME OUT. IF AN AP-5 OR AP-7 (BORESCOPE) PLUG IS NOT THERE, HOT GASES FROM THE PLUG OPENING CAN CAUSE DAMAGE TO THE THRUST REVERSER.

(b) (Post SB PW4ENG 72-675) (AP-5 and AP-7): Install the plugs into the compressor case. Do not use Antiseize Paste P06-054 or Engine Oil P03-001. Run in borescope plug to be sure plug is seated before applying torque by Table 801. R

HPC Borescope/Access Plug Installation Data
Table 801 (Continued)

(c) (Post SB PW4ENG 72-708) (AP-5 and AP-7): Install the plugs into the compressor case. Do not use Antiseize Paste P06-054 or Engine Oil P03-001. Run in the borescope plug to be sure the plug is
R seated before you apply torque by Table 801.

R (d) After you torque the borescope plug(s), use the
R PWA 105181 Mechanical Crimper to bend the tabs of
R the key washer as follows: See Figure 814.

R 1 Put the end of the crimper onto the end of the
R plug. Turn the crimper so the jaw is under a
R key washer tab.

R 2 Squeeze the crimper handle to bend the key
R washer tab until the tab makes contact with the
R hex head of the plug.

3 Release the handle and reposition the jaw so that it makes contact again at the base of the tab.

4 Squeeze the crimper handle to final bend the key washer tab until the tab makes contact with the hex head of the plug and maintains less than a 0.020 inch (0.508 mm) gap everywhere between the tab and the hex head of the plug.

5 Crimp all five (5) of the key washer tabs by the same method.

6 All tabs of the key washer must be bent, examine the tabs for the following conditions:

NOTE: Key washer PN 58H216 uses five tabs as an alternative to two. These additional tabs permit some deviation from the Standard Practices Manual, PN 585005 requirements but it is necessary that all five tabs meet these relaxed requirements. The variations to the Standard Practices Manual, PN 585005 procedure for this key washer are as follows:

a All five tabs must be within 0.020 inch (0.508 mm) maximum of the hex head of the plug. If a tab overlaps two different faces of the hex head the 0.020 inch (0.508 mm) gap requirement must be kept between the tab and which ever face of the hex head has the larger surface area coverage with the tab. It is a good practice to bend the tab against the remaining face.

b It is not necessary that 75 percent of the base of the tab make contact with the hex head of the plug.

c It is not necessary that the key washer tabs be pulled away from the axis of the plug before you torque the plug. This requirement, as stated in the Standard Practices Manual, PN 585005 is meant for key washers that have fewer tabs.

Task 72-00-00-210-020:

1. Perform Borescope Inspection Of Combustion Chamber Area (AP-8, AP-9)

A. Equipment And Materials Necessary

Standard Tools:
See Inspection/Check-01A for borescope equipment.

Consumable Materials:

Item No.	Designation
P06-023	Silver Goop (PWA 36001)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
